Athletic Badge Tests for Girls. The tests for girls have been carefully worked out by those trained in physical education. These tests are made for general use and can be carried on under almost all circumstances. They include balancing for poise, muscular coördination and running for short distances. The elements of skill and speed are used wherever possible. Throwing events and special skills are also used in some games. There are three groups of tests as in the program for the boys, and four tests in each group.

First Test. The first of the first group is a balancing test, or the deep knee bend. In this test, instructions are given as follows: walk a distance of twenty-four feet on a balancing beam which is twelve feet long and two inches wide. (Two trials are permitted. An ordinary two-by-four-inch plank set on the two-inch side may be used.) Beginning at the center of the beam, walk toward one end without turning around; walk backward to the center, making a quarter turn either to the right or left; here make a deep knee bend, come to a full squatting position, resting on the heels; then rise to an erect position, make another quarter turn in the same direction as before and walk forward to the other end of the beam; turn around, walk back to the center at the starting point. This may sound easy, but it really takes a good deal of practice to perform this feat.

In the second test of this series there is the choice of the potato race in twenty-two seconds, the "all up" Indian club race in thirty seconds or the fifty-yard dash in eight seconds.

In the potato race, wooden cubes, bean bags or actual potatoes (if they are uniform in size) may be used. Five yards in front of the starting line a twelve-inch square should be made; five yards beyond this, a six-inch circle, five yards farther a second circle and five yards beyond this one a third circle. A "potato" should be placed in each of the circles. When the runner starts she picks up the nearest potato and places it in the square, runs to the farthest circle and picks up the potato, touches the square with it and replaces it in the farther circle. She then runs back, picks up the other potato and places it in the nearer circle and returns to the starting line. She may not drop or throw the potato but must place it carefully each time. The total running distance in this event is seventy yards.

For the "all up" Indian club race, the rules are as follows: draw two circles side by side, each circle measuring three feet in diameter. Place three Indian clubs in one of the circles. Thirty feet from the center of these circles make a starting line. The contestant runs up to the circle from the starting line, takes the three clubs from the one circle and puts them in any other. The contestant then runs back to the starting point. She makes three such trips, finishing at the starting line. In moving the clubs from one circle to the other, only one hand may be used. The total distance of this event is sixty yards.

The contestant, in the third test of this group, may either throw the basket ball a distance of thirty-five feet or throw the twelve-inch indoor baseball for accuracy, making two out of five throws at a distance of twenty-five feet. The same sort of a target is used for the basket ball throw for accuracy as is described in the boys' baseball throw tests.

In the fourth test of this group there are four options: volley ball serve, making two completed serves out of five trials; tennis serve, making three out of six trials; basket ball throw from a ten-foot line, making two goals in five trials, or throw and catch a twelve-inch baseball, allowing only three errors. The volley ball net shall be eight feet in height. The serving line shall be twenty-four feet away from the net. The ball is to fall within a square ten feet by ten feet on the opposite side, ten feet away from the net.

In the tennis serve, mark off a space on some wall thirteen and one-half feet long and thirty inches high. The lower line should be thirty-six inches from the floor or ground. The server stands a distance of thirty-eight feet from the wall. The serving area is on a line which is thirteen and one-half feet, corresponding with the length of the area marked on the wall. This test may be done on a standard tennis court, but a second net must be stretched above the regular net providing for a thirty-inch space between the two nets. The served balls are to go through the space.

In the basket-ball throw, either a regular basket-ball goal or a ring eighteen inches in diameter may be used. This goal should be placed ten feet above the ground. Circles, drawn on the floor with a radius of ten, twelve and fifteen feet, are used for throwing lines. The center of the circles is taken from a point on the floor directly beneath the center of the goal ring. A goal may be made by bouncing against the back board or by a clean throw into the basket.

For the indoor baseball throw and catch, a thirty-six-foot base line and a thirty-foot pitcher's box are used. A pit and three basemen are required. The contestant stands at home plate. She catches the ball from the pitcher, throws to first, catches the return throw from first, throws to second, catches the return throw from second, throws to third and catches the return throw from third base. In this way she catches four throws and in turn throws to each of the three bases. It is possible to make seven errors. Only three are allowed.

Second Test. The first of this group of tests is the balancing test with a book on the head. It includes the deep knee bend and covers a distance of twenty-four feet in two trials.

There are four choices in the second test of this group: the potato race in twenty seconds, the "all up" Indian club race in twenty-eight seconds, the run and catch in nineteen seconds or the fifty-yard dash in seven and three-fifths seconds.

In the run and catch a starting line is drawn, and thirty feet distant a cord is stretched ten feet from the ground and parallel to the starting line. At the word "Go" the contestant starts from the starting line, tosses a basket ball or volley ball over the cord, catches it and runs back to the starting line. This is repeated three times, ending at the starting point. Time is taken at the touch of the finish line on a third catch. If the ball is not caught it must be secured and tossed over the cord but may be tossed in either direction. The total distance of this event is sixty yards.

The third test of this series is the basket ball throw for distance of forty-five feet, or the twelve-inch indoor baseball throw for accuracy, throwing three trials out of six throws and a distance of thirty feet.

In the fourth test of this group there are four options: volley ball serve, completing three in six trials; tennis serve, completing three in five trials; basket ball goal throw from a twelve-inch line three in six trials, or the twelve-inch indoor baseball throw and catch, with only two errors allowed.

Third Test. The first in this group of tests is the balancing test with a book on the head, doing three deep knee bends, walking a twenty-four foot distance on the beam, and allowing only two trials.

In the second test there is the choice of the potato race in eighteen seconds, or the run and catch in seventeen seconds, or the fifty-yard dash in seven and one-half seconds.

The third test allows the contestant to choose the basket ball throw for a distance of fifty-five feet or the twelve-inch indoor baseball throw for accuracy, three strikes out of five throws at thirty-six feet.

In the fourth test of this series there are four options: the volley ball serve, three in five trials; the tennis serve, three in four trials; the basket ball goal throw from a fifteen-foot line, three in five trials, or the twelve-inch indoor baseball throw and catch, allowing only one error.

SWIMMING AND LIFE-SAVING TESTS

Safety in swimming is a watchword to all people taking part in games and sports at the water front, and the training of each and every person to take proper steps in an emergency is an important task.

In an endeavor to cope with the situation, the American National Red Cross has promoted, through its Life Saving Corps, a standard for requirements of tests in life-saving. Everyone should learn to pass these tests if possible, for it would be an added step to his own safety and a preparation for service to others in case of need.

It is said that by studying and practicing the methods and tests outlined by the American Red Cross, swimmers of even ordinary ability can train themselves to render service to a drowning person.

An important point for everyone to remember is that the best training in life-saving is to be able to care for oneself and to be thoroughly skilled in swimming. Swimmers should learn the approved methods of life-saving so that they may help in saving a drowning person with the least possible risk to themselves. They should know, for example, that it is always best to use a boat or life buoy or some such means of saving a life before getting into the water themselves. Should the latter be necessary, the person should be in good physical condition and skilled in all the technical points of life saving.

The tests outlined and described in these pages include those for beginners, for swimmers, for Junior life-savers and for Senior life-savers. The rules and regulations, based on and following closely those of the American Red Cross, may be stated as follows:

Beginners.

1. Jump into water over own depth, level off, swim 25 feet, make a sharp turn, and return 25 feet.

Swimmers.

1. Swim 100 yards, using two or more kinds of strokes.
2. Swim 50 feet on back, using legs only, and float.
3. Recover object in 6 to 8 feet of water, by means of surface dive.
4. Perform straight front or racing dive, in good form.
5. Witness demonstration of artificial respiration.

Junior Life-saving Test. To pass this test the swimmer must (1) be twelve years old or over, (2) have passed the swimmer's test and (3) have had at least six hours' preparation and practice.

1. In deep water, disrobe and swim 100 yards.
2. Surface dive in 6 to 8 feet, recovering various objects 3 times, and a 10-pound weight once.
3. Correct approach, 30 feet, and Head Carry, 30 feet.
4. Correct approach, 30 feet, and Cross Chest Carry, 30 feet.
5. Correct approach, 30 feet, and Hair or Arm-lock Carry, 30 feet.
6. Tired Swimmer's Carry, 30 feet, preceded by 30-foot approach.
7. Release double grip on one wrist. Left and right.
8. Release front strangle hold. Left and right.
9. Release back strangle hold. Left and right.
10. Resuscitation, 1½ minutes' demonstration, Prone Pressure method.

Senior Life-saving Test. To pass this test the swimmer must (1) be seventeen years old or over, (2) have had six hours' or more instruction and (3) be a member of the American Red Cross.

1. In deep water, disrobe and swim 100 yards.
2. Surface dive, recovering objects 3 times and a 10-pound weight once in 6 to 10 feet of water.
3. Front, rear, and under-water approaches, each with proper turn and carry.
4. Head Carry, 60 feet, preceded by 60-foot swim, proper approach and turn.
5. Cross Chest Carry, 60 feet, preceded by 60-foot swim, proper approach and turn.
6. Arm-lock or Hair Carry, 60 feet, preceded by 60-foot swim, proper approach and turn.
7. Tired Swimmer's Carry, 60 feet, preceded by 60-foot swim.
8. Front strangle hold, 4 times, 2 different positions.
9. Back strangle hold, 4 times, 2 different positions.
10. Double grip on one wrist, 4 times, using alternate wrists.
11. Two people locked in front strangle, and repeat, rescuing alternate subjects.
12. Demonstration, the Prone Pressure (Schaefer) method of resuscitation, 1½ minutes.
13. Essay on "Prone Pressure Method of Resuscitation" (200 to 500 words).
14. Float motionless, 1 minute.
15. Tread water, 30 seconds.
16. One minute Carry, subject fully dressed.
17. Fireman's or Saddle-back Carry from shallow water.
18. Explain method of lifting Subject from tank or on to float unassisted.
19. Oral quiz on life-saving, 5 questions.

Awards are available for completing each of these groups of tests. The beginners' award is the Red Cross Beginners' Button. The Junior Life-saving award is a membership card in the Red Cross and an emblem to be worn on the swimming suit. The award for the Senior Life-saving reward is a membership card in the Red Cross and an emblem for the bathing suit.

SWIMMING TEAM TESTS

Team-test Program for Swimming in Schools and Clubs. It is often difficult to work out a series of tests which may be used for schools, recreational clubs and summer camps. Often the tests are too difficult for younger boys and girls. The tests described here provide for a wide range of ability; they require no special facilities, and are suitable to neighborhood centers and school groups. The tests are organized on the basis of teams. All novice swimmers would belong to the third team and as soon as they are able to pass all the tests of the third team they will advance to the second team. After passing the second team tests they then belong to the first team (advanced swimmers). To add to the interest of the tests, emblems may be designed for each of these teams. Much interest can be developed by an individual or by groups in keeping records as to the date of passing the tests, or by keeping a record of the time made in some of the events. It is possible for a non-swimmer to work on these tests by himself and thereby learn to swim with little instruction.

Novice Swimmers or Third Team Tests.

1. Face float, 5 to 10 seconds, come to standing position.
2. Pick up puck, eyes open.
3. Ankle float (grasping ankles with hands), 5 seconds.
4. Tread water, 10 to 30 seconds.
5. Back float or scull, 5 to 10 seconds, come to standing position.
6. Push off, crawl, kick or scull, 20 feet.
7. Jump or dive in, swim 30 feet on face or side.
8. Deep water, vertical float and tread, 1 minute.

9. Bobbing, deep water (go down—come up), 3 times.
10. Coil, throw life line, tow a swimmer.

Swimmers or Second Team Tests.

1. Float, or scull, 2 minutes.
2. Tread water, 2 minutes.
3. Swim elementary back stroke or sculling stroke, 20 yards.
4. Dive in, swim side stroke or dog paddle, 40 yards.
5. Sink, save self, swim a few strokes, repeat 3 times.
6. Swim, collide, grasp partner (front and rear) free self, continue swimming.
7. Plain or racing dive.
8. Swim and stroke 3 lengths of the pool.
9. Swimmer's safety test, dive in, swim at least 50 yards, float and tread without touching support (5 to 10 minutes).
10. Surface dive, recover weight.

Advanced Swimmers or First Team Tests.

1. Swimmer's safety test, dive in, swim at least 100 yards, float and tread without touching support, 10 to 15 minutes.
2. Swim the side stroke, 100 yards.
3. Swim the crawl, 100 yards.
4. Swim crawl or side stroke at least 220 yards.
5. Approach, break back strangle hold against opposition 3 times.
6. Approach, break front strangle hold against opposition 3 times.
7. Any life-saving carry, 20 yards.
8. Resuscitation, 2 minutes.
9. Back crawl or breast stroke, 20 yards.
10. Racing starts, turns, plain dive.

PHYSICAL EFFICIENCY TESTS

The National Collegiate Athletic Association in 1922 worked out, on the basis of points, efficiency tests for freshmen. These valuable tests may easily be adapted to the use of third and fourth year high school students. Standards are set up in each event in order that each contestant may determine his own score, hence it is possible for any individual or a group to check up on physical ability by using these standard tests. There are four events in this series, the one-hundred-yard dash, the running high jump, the running broad jump and the bar vault. In these events three standards or scores are listed for each. For meeting the best test in each, three points are allowed; for the second best, two points, and for the third best, one point. In the hundred-yard dash one point is allowed for running the distance in thirteen seconds, two points in twelve and two-fifths seconds, three for eleven and three-fifths seconds. In the running high jump one point is allowed for three feet six inches, two points for three feet eleven inches and three points for four feet three inches. In the running broad jump one point is allowed for twelve feet one inch, two points for thirteen feet four inches and three points for fourteen feet four inches. In the bar vault one point is allowed for four feet, two points for four feet six inches and three points for four feet nine inches.

Pentathlon and Decathlon Tests. Many schools have as a part of their physical education programs Pentathlon and Decathlon tests. The names of these tests have come down to us from the days of the Ancient Greek Olympics. The Pentathlon consists of five events selected from the various athletic activities. The events selected are those which test skills in the various fundamental activities of running, jumping, throwing and climbing. Tests made up of these activities call for an all round development and skill. The Decathlon consists of ten events giving a wider range of activity for the contestant. Grouping physical education activities in the Pentathlon and Decathlon adds interest to the program.

In the elementary school the Decathlon and Pentathlon events are made up of stunts, potato races, rope climbing, running, broad jump, standing broad jump, fifty-yard dash, seventy-five-yard dash, basket ball goal throw, baseball throw for strikes, soccer distance kick, tennis serve, basket ball throw for distance, traveling rings, volley ball serve, push up, one-hundred-yard dash, eight-pound shot, tennis serve, soccer distance kick, basket ball goal kick, twenty-yard swim, basket ball pass, and other events selected for a special group. In the high school similar events may be chosen but all require a higher degree of skill and ability.

MOTOR ABILITY TESTS

Everyone likes to try himself out on stunts and is always ready to challenge somebody else to "try this one." Little does one realize that his ability to do certain stunts may be an index of his general motor ability. Present day programs in physical education are more and more taking into account the native ability of young people in organizing and carrying on physical education activities. Motor ability does play a very important part in this part of the physical education program. There are a number of achievement tests in physical education, but very few motor ability tests, which have been worked out scientifically. The Brace Motor Ability tests are highly authoritative. They consist of twenty stunts all of which anyone will enjoy and which at the same time serve as an index of his motor ability. See how many of them you can do.

Test 1. Walk in a straight line, placing the heel of one foot in front of and against the toe of the other foot. Start with the left foot. Take 10 steps in all, 5 with each foot. Eyes open. Failures consist of: (1) losing the balance and stepping out of line; (2) not walking in a straight line and (3) not placing heel to toe.

Test 2. Stand, jump into the air and clap both feet together once, and land with the feet apart (any distance). Failures consist of: (1) landing with the feet touching each other; (2) not clapping the feet in the air once.

Test 3. Lie flat on the back on the floor. Fold the arms across the chest. Raise the trunk to a sitting position. Do not raise the feet above the floor or unfold the arms. Failures consist of: (1) raising the feet above the floor (this does not include sliding the feet, which is permissible); (2) unfolding the arms; (3) not sitting up.

Test 4. Stand. Fold the arms behind the back. Kneel onto both knees. Get up without losing the balance or moving the feet about. Failures consist of: (1) losing the balance either going down or getting up; (2) moving the feet after standing up; (3) unfolding the arms.

Test 5. Take a front leaning rest position, that is, place hands on the floor, arms straight; extend the feet back along the floor until the body is straight (in an inclined position to the floor). Bend the arms, touching the chest to the floor, and push up again to straighten arms. Do this 3 times in succession. Do not touch the floor with the legs or waist. Failures consist of: (1) not pushing up 3 times; (2) not touching the chest to the floor each time; (3) resting the knees, thighs or waist on the floor at any time.

Test 6. Squat on the heels with feet together and knees out, and hands between the knees with fingers touching the floor. Spring up onto both heels, with legs straight and toes up, and swinging both arms out at the side, level with the floor. The feet should then be about 18 inches apart. Head up. Repeat this exercise 3 times (in all) rhythmically. Failures consist of: (1) not getting the arms and legs in position; (2) not doing it 3 times in succession without stopping.

Test 7. Stand with feet together. Jump into the air and make a full turn to the left, landing on the same spot. Do not lose the balance or move the feet after they strike the floor. Failures consist of: (1) not getting all the way around; (2) moving the feet after they strike the floor.

Test 8. Jump into the air and clap the feet together twice and land with the feet apart (any distance). Failures consist of: (1) not clapping the feet together twice; (2) landing with the feet touching each other.

Test 9. Stand on the right foot. Grasp the left foot behind the right knee. Bend and touch the left knee to the floor, and stand up without touching any other part of the body to the floor, or losing the balance. Failures consist of: (1) touching the floor with any part of the body except the left knee; (2) not touching properly and not standing with right leg straight, and losing the balance.

Test 10. Hold the toes of either foot in the opposite hand. Jump up and jump the free foot over the foot that is held, without letting go. Failures consist of: (1) letting go of the foot that is held; (2) not jumping through the loop made by holding the foot.

Test 11. Jump into the air and slap both heels with the hands behind the back. Failure consists of: not touching both heels.

Test 12. Stand, kick the right foot up so that the toes come at least level with the shoulders. Do not fall down on the floor. Failures consist of: (1) not kicking as high as the shoulders; (2) falling down and touching the floor with any part of the body other than the feet.

Test 13. Stand on the left foot. Bend forward and place both hands on the floor. Raise the right leg and stretch it back. Touch the head to the floor, and regain the standing position without losing the balance. Failures consist of: (1) inability to touch the head to the floor; (2) losing the balance and

having to touch the right foot down or step about.

Test 14. Stand with both feet tight together. Bend down, extend both arms down between the knees, around behind the ankles, and hold the fingers together in front of the ankles without losing the balance. Hold this position for 5 seconds (counted by scorer). Failures consist of: (1) falling over; (2) not touching and not holding the fingers of both hands together; (3) not holding the position for 5 seconds.

Test 15. Stand with both feet together. Swing the arms and jump up in the air, making a full turn to the right. Land on the same spot and do not lose the balance; that is, do not move the feet after they first strike the floor. Failures consist of: (1) not making a full turn and not landing facing in the same direction as at the start; (2) losing the balance and having to step about to keep from falling.

Test 16. Kneel onto both knees. Extend the toes of both feet out flat behind. Swing the arms and jump to the feet without rocking back on the toes, or losing the balance. Failures consist of: (1) having the toes curled under and rocking back on them; (2) not executing the jump, and not standing still on both feet.

Test 17. Fold the arms across the chest. Cross the feet and sit down cross-legged. Get up without unfolding the arms or having to move the feet about to regain the balance. Failures consist of: (1) unfolding the arms; (2) losing the balance; (3) not getting up.

Test 18. Stand on the left foot. Hold the bottom of the right foot against the inside of the left knee. Place hands on hips. Shut both eyes, and hold the position for 10 seconds, without shifting the left foot about on the floor. Failures consist of: (1) losing the balance; (2) taking the right foot down; (3) opening the eyes or removing the hands.

Test 19. Take a squat rest position. That is, place the hands on the floor between the knees and close to the feet. Bend the elbows slightly and place both knees well over the elbows. Rock forward onto the hands, raising the feet from the floor. Support the body on the hands. Hold the position for 5 seconds (as counted by the scorer). Failure consists of: (1) not keeping the body off the floor for 5 seconds.

Test 20. Stand on the left foot with the right foot extended forward off of the floor. Sit down on the heel of the left foot, without touching the right foot or hands to the floor. Stand full up without losing the balance. Failures consist of: (1) not sitting all the way down on the left heel; (2) touching the right foot or hands to the floor; (3) not standing up with left leg straight before touching the right foot.

How to Score. If you wish to know how you have scored on these tests the following tables will enable you to determine it. Keep a record of the number of tests that you were able to pass. Your score is the figure opposite the number of tests passed in Table I.

TABLE I—Ages eight to eighteen. The following table is used to convert the number of tests passed into a score.

Number of Tests Passed	Score
0	19
1	22
2	23
3	26
4	29
5	33
6	35
7	38
8	40
9	43
10	45
11	48
12	52
13	55
14	58
15	61
16	64
17	68
18	72
19	76
20	80

NOTE: It will be observed that even though no tests are passed, there is a minimum score. This is because no one is considered totally lacking in motor ability because the tests given do not cover every possible test.

TABLE II—Meaning of the Scores—In Table II locate your score in the proper place. You can then determine your percentage rating.

Scale Scores	Approximate Percentage Rating	Approximate Meaning
Above 50	50	Above average
Below 50	50	Below average
Between 40 and 60	66	The middle two-thirds
Above 60	16	The highest one-sixth
Below 40	16	The lowest one-sixth

GAMES, SPORTS AND RECREATIONS

INTEREST in all forms of games and recreations is increasing rapidly in America. Physical education in our schools and colleges is placing more emphasis upon all forms of recreational sports. The municipalities through their parks and playgrounds provide facilities for many different kinds of recreation and people are urged to participate. Enjoyment of sports and recreations is a most healthful and beneficial way to spend our leisure time. There are many games and sports which can be taken up by the individual or a small group. There are described here most of the popular games and sports. Included also are accounts of national clubs of boys and girls.

ARCHERY

Archery long ago ceased to be of life and death importance. The last notable use of bows in war was made by the Chinese, about 1860. But in the days of the early Edwards and Richard III in England, the long bow was England's chief defense against her enemies. The king commonly required the entire male population to practice with the bow every Sunday, and forbade all other sports. In Scotland, surreptitious golf gave the department of state a good deal of trouble.

Queer as all this is, archery as a pastime has kept much of its old fascination, as every boy knows; and the details of this modern game are sure to interest many.

The best bows are still made of yew, as they were six hundred years ago, and the best yew comes from Italy and Spain. But when yew was hard to get, the English armed their less skillful marksmen with witch hazel, ash and elm. If they had been able to get at the American hickory, the chances are it would have been used. The American Boy Scout handbook names mulberry, Osage orange, sassafras, Southern cedar, black locust, apple, black walnut, slippery elm, ironwood,

mountain ash, hickory, California yew and hemlock as suitable woods for bows.

The English long bow was usually five feet long. The practice now is to have it about as long as the bowman is. The stiffness of a bow is spoken of as its "weight," in the number of pounds pull required to draw a full-sized arrow to the head. A woman's bow now weighs twenty-four to thirty-two pounds, a man's bow forty to sixty pounds, and a Boy Scout's bow fifteen.

Like fishing rods, bows are made either solid or spliced, and are glued. The one piece, "self" bow has the pleasanter action, but costs more, and is more apt to warp or spring out of shape. All very long bows are likely to be spliced in the middle. The wood is rounded on the inside, toward the string, and flattened on the other side.

Experts say that it takes more skill to make a good arrow than to make a good bow. A perfect target arrow is quite a complicated affair. The main shaft is of pine, with a piece of hard wood to carry the metallic head. A square notch is cut for the string, and just forward of the notch three feather guides are attached, either by glue or by silk winding, fore and aft. If these feathers curve, it is important that they all curve the same way.

The string is best made of flax or linen, silk wound for the arrow head, and carefully waxed or glued.

Targets for the modern sport of archery are four feet in diameter, with a series of concentric rings four and four-fifths inches broad. The score is: inner circle, gold; nine points; inner ring, red, seven points; next ring, blue, five points; next ring, black, three points; outer ring, white, one point.

Popular distances now are forty, fifty and sixty yards—quite unlike in the days of Robin Hood. Of course the secret of this change lies

in the fact that the modern rifle begins where the best bowmen of Robin's day left off.

BADMINTON

Badminton is comparatively a recent game in America although it has been played in other countries for many years. It is becoming a most popular game because of its close relationship to tennis. It is an especially desirable game for younger children who like tennis; tennis rackets are too heavy for them while the badminton racket is very light.

Badminton can be played upon a tennis court using the same net. The doubles court is twenty feet by forty-four feet. On each side of the net there is a six-foot service line and back of that two thirteen-feet courts, one on either side, and the back boundary line is two and one-half feet wide. The singles court is practically the same but does not have a separate back boundary line; and the singles court is only seventeen feet wide. The rackets are similar to those used in tennis but much lighter and the handle is longer, resembling a squash racket. Instead of balls, shuttles are used. They weigh from seventy-three to eighty-five grains, and are made of cork one to one and one-half inches in diameter, and slightly weighted. Around the cork there is a row of fourteen to sixteen feathers from two and one-half to two and three-fourths inches in length. The "serve" is made the same as in tennis. The returns of the shuttle have to be made while it is in the air as it will not bounce from the ground. This makes the game interesting and very fast. As the shuttle is struck with a racket it goes swiftly for a short distance and then slows down suddenly. It requires accurate judgment to account for this change of pace in the travel of the shuttle. Scoring is similar to that of tennis and is easy to follow for a beginner.

Badminton is an especially desirable game because it does not require expensive courts and high fence protection. The shuttle never goes far and time is not lost in retrieving it.

BASEBALL

Baseball is played by two opposing teams of nine men each, on a field containing a diamond. A baseball diamond is a square, ninety feet on each side, with a base at each corner.

When a player makes a complete circuit of the four bases without being put out under the rules of the game, he has scored, or made a "run" for his team. The side making the larger number of runs during a game wins.

A standard game of baseball consists of nine innings. For the first half of the first inning, the captain of the home team chooses whether his men shall bat or take the field. After three men of the side first at bat have been put out, the teams exchange places, and so alternate throughout the game, each half inning continuing until three men have been put out.

A man at bat becomes a base runner (a) if he makes a fair hit (not a foul); (b) if the umpire calls four balls on the pitcher; (c) if under certain conditions a third strike called by the umpire is not caught and held by the catcher; (d) if the person or clothing of the batter is hit by a ball at which he does not strike, and which he makes a reasonable effort to avoid; (e) if the catcher interferes with his attempt to bat; (f) if a fair hit ball touches the person or clothing of an umpire or base runner before touching a fielder.

A player is declared "out" in any one of some thirty cases, the commonest being these:

(1) If he bats either a foul or a fair hit which is caught by an opponent before the ball touches the ground.

(2) If, while a batter, three strikes are called on him.

(3) If, while a base runner, he is touched by a ball in the hands of an opponent, unless some part of the runner's person is in contact with a base to which he is entitled.

(4) If he interferes with a player attempting to field a batted ball.

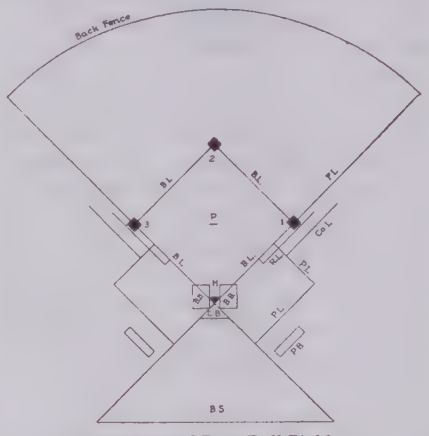

Diagram of Base Ball Field

B. B. Batter's Box; H. Home Plate; 1, 2, 3. Bases; P. Pitcher's Plate; C. B. Catcher's Box; P. L. Player's Lines; B. L. Base Lines; R. L. Runner's Lines; Co. L. Coacher's Lines; F. L. Foul Line; B. S. Backstop; P. B. Players' Bench.

(5) If, in running bases, he runs more than three feet from the base line, except to avoid an opponent who is fielding a batted ball.

Batsmen are passed to first base without liability to be put out (a) when four balls are called; (b) when hit by a pitched ball; (c) when the catcher interferes with batting; (d) when a fair hit ball strikes the person or clothing of an umpire or base runner before reaching a fielder; (e) if the umpire declares a "balk."

Base runners advance one base without liability to be put out:

(1) Whenever, by reason of any player receiving free advancement under the rules, two men would otherwise claim the same base. If, for example, all bases were full when a batsman is passed to first by four balls, the situation will bring in a score and still leave the bases full.

(2) If the umpire calls a balk.

(3) If the catcher allows a passed ball.

(4) If the base runner is blocked from a base by a fielder who has not the ball in his possession.

(5) If the catcher moves out of his position pending a throw by the pitcher.

An illegal catch of a batted ball gives all runners three bases; of a thrown ball, two bases; and in either case the runner may advance further at his own risk.

Materials. *Official Ball.* Reach or Spalding, cork center, yarn wound, horsehide cover, 9 to 9¼ in. circumference, 5 to 5¼ oz.

Bat. Hardwood, round, diameter not over 2¾ in., length not over 42 in.

Catcher's or First Baseman's Mit. Any size, shape or weight.

All Other Gloves. Weight not over 10 oz., size not over 14 in. around palm.

Protector. A padded or air-filled shield for the body of umpire and catcher.

Mask. A wire head gear for men working behind the bat, especially to protect against foul tips.

Leg Guard. A lower defensive armor for umpire and catcher.

Base. Stuffed canvas bag, 15 in. square, attached by its center at intersection of base lines, for first, second and third bases.

Home Plate. Five sided white rubber plate. Front 17 in., sides 8½ in., running along base lines 12 inches each.

Pitcher's Plate. White rubber, 24x6 in., located 60 ft. 6 in. from home plate.

Toe Plate, Heel Plate. Spiked to prevent slipping.

Grounds. *Diamond or Infield.* A square, 90 ft. on a side, within or near which the pitcher, catcher, basemen, and shortstop play their defensive game against the batsmen and base runners of the opposing team.

Outfield. The clear space beyond first, second and third bases, in which the three fielders work. The outfield should extend at least 235 ft. from the home plate.

Pitcher's Box. A position of the pitcher, in which one or both the pitcher's feet are touching the pitcher's plate.

Catcher's Box. A triangular space 10 ft. deep, behind the home plate. (See diagram.)

Batter's Box. A rectangle 4x6 ft., at right and left of home plate, 6 in. from the plate.

Player's Lines. Enclosed rectangles 50x74 ft. along base lines each side of home plate, to be kept clear of all players not actually engaged in the game.

Coacher's Lines. Outside the diamond, 15 ft. from the foul line and parallel to it, near first and third, beyond the players' lines. One coacher may work along this line at first and one at third, but never within the line.

Runner's Line. Begins 45 ft. from home plate, runs parallel to base line, 3 ft. outside the diamond, to first base.

Backstop. A large upright frame covered with wire netting, at least 90 ft. behind home plate.

Grand Stand, Bleachers. No seats for spectators within 90 ft. of home plate or of foul lines. In outfield, no spectators or obstructions within 235 ft. of home.

Foul Lines. The base lines from home plate to first and third, and their continuation into the outfield.

Players' Bench. A bench at least 25 ft. outside player's lines, on which must be seated all players of the team at bat, unless actually batting, coaching or running bases.

Terms of Play. *Assist.* Any handling of the ball which directly aids in putting an opponent out is called an "assist" and is so recorded by the scorer.

Balk. One of the numerous motions forbidden chiefly to the pitcher. For example, the pitcher may not begin to throw to the batter or to first base without completing the throw; he may not throw to put out a base runner without stepping directly toward

the base he aims at. (See Reach or Spalding guides.)

Base on Balls. When a pitcher has made four throws to a given batsman, at which the batsman does not strike, and which do not pass over any part of the home plate, the batsman is entitled to become a base runner at first base. Certain other throws by the pitcher are also called balls. (See guides.)

Base Runner. A player who has ceased to be a batsman, and is on his way around the diamond, in an attempt to score.

Batting Order. A regular arrangement of player's names, for succession in batting. Batting order cannot be changed during a game, except by the use of substitutes.

Block Ball. A ball which, while in play, touches any person not in the game. In case of block ball, the players running bases may advance until the ball is again in pitcher's hands.

Bunt, Bunt Hit. A form of batting in which the ball strikes the bat, instead of the bat striking the ball. A bunted ball is commonly a sacrifice, though a swift runner with a quick get-away may sometimes beat out a well-placed bunt, especially if there is indecision among the fielders as to who shall field the bunted ball. A bunted foul counts as a strike, even a third strike.

Called Game. A game terminated by the umpire because of rain, panic, fire, darkness or any other cause endangering players or spectators. Games called before the fifth inning is completed are commonly called no game.

Caught Stealing. The putting out of a base runner who is trying to make a base on the sly.

Chance. The opportunity of a fielder so to field a ball as to assist in retiring a base runner.

Double Play, Triple Play. A play in which two runners, or three, are put out in quick succession, by clever fielding.

Drawn Game. A game with a tie score, called by the umpire after five or more innings.

Earned Run. Scored when a player reaches home base by reason of safe hits, sacrifice hits, stolen bases, bases on balls, hit batsmen, wild pitches and balks, but not by reason of fielding errors or penalties other than those implied in this list.

Error. In general, any misplay in fielding which prolongs the life of an opposing batter or base runner.

Extra Innings. Play which runs beyond the regular nine innings, by reason of a tied score.

Fair Hit. A hit which settles on the foul line or inside the diamond, short of first or third base; a hit which, passing first or third base, bounds on fair territory or first strikes on fair territory.

Fly. A ball batted high in fair territory.

Forfeited Game. A game awarded by the umpire against an offending team, by reason of broken rules of play.

Foul, Foul Hit. (1) Short of first or third base, a batted ball which settles outside the diamond, or would so settle if not interfered with. (2) A batted ball which bounds past first or third in foul territory. (3) A batted ball which first lands on foul territory beyond first or third base.

Foul Strike. Fouls count toward the first two of a batter's three possible strikes. Foul bunts may count for all three strikes.

Foul Tip. A foul hit in which the bat merely glazes the ball.

Hit Batsman. A batsman whose person or clothing has been hit by a pitched ball which he made reasonable effort to avoid.

Homer, Home Run. A fair hit which goes so far that the batter is able to make a circuit of the bases before the ball can be fielded.

Infield Fly. Before two men are out, with runners on first and second bases, the umpire will declare "out" any man who bats a fair fly which can be handled by the infield, bunts excepted.

Passed Ball. A pitched ball which goes to the backstop 90 ft. behind home plate. In such case all runners advance one base.

Run. A complete circuit of the bases, resulting in a score.

Runs Batted In. Runs scored by reason of hits made by other players.

Sacrifice. A hit made for the purpose of advancing a base runner, though the batter expects to be put out.

Safe Hit. A hit which cannot be fielded in time to prevent the batter reaching first base.

Shut Out. When a team is prevented from scoring during an entire game.

Strike. In general, one of three batting opportunities, the loss of which will put a batsman out, or the act of losing one of these three opportunities. See opening discussion.

Time. Temporary suspension of play by the umpire.

Time at Bat. A lawful occupation of the batters' box which does not terminate in four balls, a hit batsman, a sacrifice hit or interference by the catcher.

Wild Pitch. A pitched ball so high or wide that it cannot be effectively fielded by the catcher.

Abbreviations in Baseball

AB. At Bat; BR. Bats Right-handed; BL. Bats Left-handed; R. Runs; H. Safe Hits; TB. Total Bases Batted; 2B. Two Base Hits; 3B. Three Base Hits; HR. Home Runs; SH. Sacrifice Hits; SB. Stolen Bases; BB. Bases on Balls; RBI. Runs Batted In; RRF. Runs Responsible For; CS. Caught Stealing; SO. Struck Out; PT. Percentage; DP. Double Play; TP. Triple Play; PB. Passed Ball; PO. Put Outs; A. Assists; E. Errors; TC. Total Chances; PR. Pitches Right-handed; PL. Pitches Left-handed; IP. Innings Pitched; ER. Earned Runs off a Given Pitcher; PTER. Percentage of Earned Runs; HB. Hit Batsman; HP. Hit by Pitcher; WP. Wild Pitch; B. BK. Balk; W. Won; L. Lost.

BASKET BALL

Basket ball is one of the best of games for both player and spectator. There is opportunity for personal prowess and for team work; quick thinking and quick action are at a premium; accuracy of motion and of judgment are necessary. The individual star has frequent opportunities to shine, but he will often be eclipsed if he does not use the good passwork of his team to support his personal brilliance. Attack and defense are so varied, so quickly shifting from one team to the other, that a moment's inattention may be very costly.

The side which has the ball attempts to advance it for a try at goal; the defending team meanwhile uses every legal effort to break the attack by getting possession of the ball.

Like all good games, basket ball is what it is largely because of its rules. These rules vary slightly from year to year, and vary with the quality of the players, there being separate sets of rules for women, for professionals and for male amateurs. Rules for women eliminate roughness, reduce the danger of falling, shorten the distances covered in running and in general adapt the game to the feminine physique. Amateur rules for men are in a number of respects intermediate between the vigorously combative game of the professionals and the non-interfering game played under women's rules. The following summary of play is founded on the amateur rules for men.

A basket ball court is a rectangle sixty to ninety-four feet long and thirty-five to fifty feet wide, with clearly marked sides and end lines. At the middle of each end, a "basket" is suspended ten feet above the floor, from a wire ring eighteen inches in diameter, carried by a back board four feet by six.

Free-throw lines are twenty-four inches long, directly in front of the baskets, seventeen feet from the end lines. Free-throw lanes are so marked that no player of either side may come within three feet of the ball during its progress from the free-throw line to the basket.

At the center of the court is a circle four feet in diameter, within which the ball is put in play by the referee at the beginning of the game and at various other times as provided by rule.

The object of the game is to score baskets or goals—each team attempts to throw or toss the ball through its own basket. A goal scored from the field in the ordinary course of the game counts two points; a goal secured from the free-throw line as the penalty for a foul committed by opponents counts one point.

Two classes of fouls are distinguished: Personal fouls are declared for forbidden roughness in personal contact, for holding a player or blocking his progress. For personal fouls, the penalties range from one free throw to the disqualification of the player for the remainder of the game. Four personal fouls of any sort during a game disqualify the player for the remainder of that game.

Technical fouls are called for other violations of the rules. For example, it is forbidden to carry the ball more than one step in any direction, to make a second dribble without first passing the ball to another player, to delay the game, to talk to officials during the game, and so on.

To "dribble" is to keep the ball moving, in one player's possession, by throwing, batting, rolling or bounding it with one hand. A dribble ceases if the ball comes to rest in one or both hands, if it touches both hands at once or if it touches a second player. The ball may be batted in the air only once during a dribble. A player may throw for goal after dribbling.

The ball is "dead," and is put in play at center by the referee after a goal is made, after the two free throws following a double foul, when the ball lodges in the supports of the basket or after a free-throw following a technical foul.

A ball becomes dead when it goes out of bounds. The last player who touches it

before it leaves the court is held to be the cause of its going out of bounds. The referee commonly designates the nearest opposing player to put the ball in play, by throwing, rolling or bounding it to another player in the court.

A ball is "held" when two opposing players have one or both hands on it, or when a closely guarded player is held by the referee to be withholding the ball from play. A held ball is dead until put in play by the referee at the spot where held, in the same manner as at the beginning of the game, except that a ball held in either end zone must be thrown out by a member of the defending team.

If the referee is unable to decide who is responsible for a ball going out of bounds, he declares a "jump ball" near the boundary line, between two players of his own choosing.

Team work, accuracy in handling the ball, speed, quickness and accuracy of judgment, cleverness in deceiving opponents all go to make the good player and the good team in basket ball. A good coach will invent a variety of snappy exercises to test and develop all these general qualities. He will also train for the actual situations of play. For example, several players must be able to throw baskets from the foul line, scoring at least three shorts in four; several players should specialize in the dribble; everybody should practice receiving a hotly-thrown ball while running toward the basket, instantly checking himself for the try-at-goal; baskets should be thrown from the field at long and short range, from all angles; a number of systems should be perfected for getting the ball down the field by passing, and so on.

BOWLING

A bowling alley must be sixty feet long from foul line to head pin; the rolling surface must be forty-one to forty-two inches wide—smooth, and perfectly level. Balls may not weigh more than sixteen and one-half pounds nor be more than twenty-seven inches in circumference, though any smaller size may be used. The ten "pins" are each fifteen inches high, turned from hard maple, with carefully standardized dimensions. Back of the foul line, which a bowler may not cross, is a runway of at least fifteen feet long. At the far end of the alley is the pit, for receiving balls and pins. Three inches from the pit a row of four circles mark the base of the pin pyramid. The next row contains three, the next two, making the total ten, with the head-pin. Pins are exactly twelve inches apart from center to center.

Any number of players may compete, each rolling one "frame" of two balls, in turn, until ten frames have been rolled. If the first ball rolled by any player knocks down all the pins, a "strike" is recorded, by marking an X in the upper right hand corner of the player's score for that frame. The final score for a frame in which a strike occurs cannot be recorded until two more balls have been rolled by this player, for the score in such a case consists of the sum of all pins knocked down in three shots by him. If all three shots should be strikes, the score for the first frame would be 30, and a game entirely made up of strikes would bring a score of 300. If all the pins are knocked down in two shots, a "spare" is noted by making a diagonal line in the upper right hand corner of the frame. The point score for that frame will count ten pins from these two shots, and whatever pins may fall from the first shot in the next frame. If this third shot is a strike, the score will be 20 for the frame in which the spare was made.

BOXING

Boxing, when conducted on a proper basis, is accepted as a desirable activity in the modern program of physical education. It is a contest of pluck, skill and endurance, and under competent instruction develops in the participants a sense of honor, integrity and fair play.

As a sport, boxing was in vogue among the early Greek and Roman athletes. In those early days the contestants armed their fists with strips of rawhide (the *cestus*), which were often loaded with iron or lead. In England, where boxing became immensely popular, rules were laid down which made its practice less brutal and laid the foundation for the dominance of intelligence over sheer strength.

Modern boxing is a contest of skill in which the contestants strike at each other with the closed fist which is covered with soft leather gloves stuffed with horsehair. With the use of boxing gloves came the adoption of new rules—the Marquis of Queensbury—so named after the title of their framer. Under newer and better rules boxing has forged ahead as a leading sport and exercise. The ancient spirit of fighting, often coupled with the emotion of anger, has given place to the modern spirit of clean sportsmanship.

General Suggestions. *Position.* Left arm, left foot advanced, right foot angled for a brace in starting, right heel slightly off ground, for quick action. Body quartering, left side forward, generally slightly crouched. Thumbs in the only safe position—the middle one.

Distance. Do not waste strength making or guarding blows which could not reach their mark. Work in, quickly, before you really attempt to land. Give as little warning as possible, make your blows snappy, with a quick get-away. In gauging distance by extending the arm, work around toward your left, away from the opponent's dangerous right arm, until you get your opportunity for leading in.

Muscles. Active, but not strongly contracted, except in the very act of striking or receiving a heavy blow.

Movements. Bend the body forward and back from hips; bend head, neck, shoulders and back quickly, freely, in all directions. These movements deceive the enemy as to distance, are useful in guarding and in covering and launching an attack.

It is exceedingly important to answer every blow you see coming, by a "counter blow," at the same time guarding against the one you have seen under way.

Follow up your successful blows with a "rush" and shower if you're sure it's safe—look out for opening yourself to a big blow of the knockout sort.

Seldom make big windmill swings. They are too obvious, and dangerous to the man who makes them. Save your big attacks for real openings. Don't put all your force in a blow that could be easily blocked, and probably will be.

Give first and most careful attention to defense. The chief means of guarding against attack are blocking, shoving aside a blow, stopping an opponent's blow by a quick counter blow, slipping, ducking and side stepping. Study the signs of a coming blow. The eye is the great tell-tale. Watch it!

To "block" is to receive on the fist or arm a blow meant for the body or head. In the instant of using one hand for blocking, watch for an opening for the other. Put only enough effort in the blocking motion to keep off the force of the blow. The right arm is the main guard. Don't send it too far out in blocking, or you will leave an opening.

Coming blows may be shoved aside either to right or left. It is occasionally possible to shove an opponent's right across to your right, or his left to your left, thus turning him partially around, making an opening and perhaps disturbing his balance. The open palm does well in blocking and shoving off blows.

"Stops" are quick counter blows with the left hand, shot out for the head or body in the instant you feel the enemy is going to strike. Stops are good when they beat the other fellow to it, and so surprise the force out of his blow or head it off altogether. While making stops with the left, change the guard of the right, to protect both body and face.

A "slip" is a sudden jerk of the head or body to right or left, letting a blow glance by. If the blow is from the opponent's right, slip to your right, and vice versa.

In boxing, a "duck" is a big slip, usually to avoid a big swing for the head. Guard the chin while ducking, and make a counter blow with the other hand.

A "side step" has three swift movements; retreat one step, spring to right one step, and turn to left, facing opponent.

A "feint" is a useful preparation for a lead. A short step forward with the left, a snappy blow which you know will not quite land, instant recovery, and instantly a longer step, with a real blow. Feinting is commonly done with the left hand. If with the right, feint for the head and lead for the body, or feint low and strike high. Feinting of course succeeds only when it causes the enemy to raise or lower his guard, leaving an opening. Feints are used also to draw leads from the enemy, which, being expected, can be blocked and countered, often to marked advantage. The feint and the real blow following are of course almost always by the same hand. A good feinter who is quick on his feet keeps his opponent guessing.

In general, hit with the palm down—a position which leaves the forearm ready to block or shove away a blow, as well as to attack. Practice all sorts of blows—straight out, hooks to right and left, uppercuts, jabs by the body twist and even the slugging windmill swings. To strike with weights in the hand is a practice that puts power in the blow of the empty hand later on.

John L. Sullivan changed the long-drawn brutality of old-time fist fights into a swift decisiveness, by the use of "knockout blows." Corbett and others perfected these blows and added variations. There are four main types

of knockout, and it is well to know all about them, possibly for offense, surely for defense. These four blows land (1) on the point of the chin or near it; (2) on the solar plexus, or pit of the stomach; (3) over the heart, and (4) on the neck close under the ear. The most painful of these is the stomach blow; the most temporary effect is from the blow under the ear.

Skill in boxing can come only through constant practice of a good many sorts. A punching bag is indispensable, as are chest weights, used in all possible positions.

Breathing exercises and long runs in the open are good for the "wind" and some quick-shifting game like squash is fine for speed on the feet. But most necessary of all are a wrestling mate for generally "mixing it up," and a sparring partner, preferably one more skillful than you.

BOYS' AND GIRLS' CLUBS

Boy Rangers. Up to 1913 there was no large organization which attempted to train boys between the pre-scout age of eight and twelve in habits of order, obedience and real growth. In order to supply this need, Mr. Emerson Brooks of Montclair, N. J., organized a local body called "Boy Pioneers." Later, after it became nationally known by being introduced into other states, the name was changed to "Boy Rangers of America."

The lore of the American Indian is the lure of the Boy Ranger idea. The boy "plays Indian" and builds character as he plays. A local organization is called a "lodge," and this is composed of "tribes," each tribe bearing an Indian name. Each boy is also given an Indian name.

Every applicant for membership must sign the following pledge, with full consent of his parent or guardian:

"I will do my best to live up to the Ranger Constitution and help my Brother Ranger do the same.

"I will make an honest effort, as a Ranger, to do at least one good turn each day, and pay my wampum each week."

Drafted in poetical form, the rather unique constitution of the Rangers is as follows:

"TRUSTY TOMMY is a Ranger,
LOYAL, true to every test,
HELPFUL to the needy stranger,
FRIENDLY, giving of his best,
COURTEOUS to the girls he knows,
KIND, a good turn every day,
OBEDIENT to his parents, too,
CHEERFUL both in work and play.
THRIFTY, saving for a need,
BRAVE, and not a faker,
CLEAN in thought, in speech and deed,
REVERENT to his Maker."

The Boy Ranger plays the Indian game naturally and is taught to put into his "medicine bag" the finest things of service and character. When he reaches the age of twelve he can enter the work of older boys' organizations with zest and spirit and understanding, because the Boy Ranger program in no way overlaps that of any other organization and because, as a Ranger, he has been given a valuable foundation for group activity.

Because church workers, teachers, parents and others interested in boy welfare have noted the splendid results achieved through Boy Ranger activities, many organizations throughout the country—such as parent-teacher associations, settlements, Boy Scout councils, public and private schools, foundations, and various recreational, fraternal, military, patriotic and educational groups—have sponsored the movement.

Such famous men as Charles Evans Hughes, Elihu Root, Ray Lyman Wilbur, John Grier Hibben and John W. Davis have linked their names with the organization, which is further proof of the worthy character of the Boy Rangers of America.

In 1930 the organization had already spread throughout forty-seven states and had been introduced into China, Hawaii, Japan, Mexico, Porto Rico and South America. There were 860 chartered lodges, with a membership of 20,000 rangers. The national headquarters are located at 186 Fifth Avenue, New York City.

Scouts Hiking

Boy Scouts with knapsacks and other equipment which help them to be capable and independent. A Scout believes in being prepared.

Boy Scouts. "Scout" is a word which used to refer to the one "on watch" for the rest. But the meaning has widened. It has been made to fit the town as well as the wilderness, and suited to peace time instead of war.

A Boy Scout is an expert in life-craft as well as in woodcraft, for he is trained in heart as well as in head and hand. Scouting is broad enough to cover riding, swimming, tramping, trailing, photography, first aid, camping and handicraft; it also includes loyalty, obedience, courtesy, thrift, courage, kindness and many other virtues.

A Scout enjoys a trip into the woods more than he does a walk over the smoky streets of the city. He can tie a knot that will hold, he can swim a river, he can pitch a tent, he can mend a tear in his trousers, he can tell you which fruits and seeds are poisonous and which are not; he can identify birds and animals and fish, and knows the ways and home of each. A Scout sees many things that others do not see, because his eyes are keen. He is mentally awake.

A Scout does not shout his wisdom from the housetops; he knows the real power that comes from knowledge. He speaks quietly and answers questions modestly.

A Scout holds his honor as his most precious possession. He knows what is his duty and all obligations imposed by duty he carries out of his own free will. He guards his honor as closely as did the knights of old. In this manner a Scout wins the confidence and good will of all people.

A Scout can make himself known to a brother Scout wherever he may be by a method which only Scouts use. He has brothers in every city in the land and in every country in the world. Wherever he goes he can give his sign and he will get a cordial welcome. He can talk with a brother Scout without making a sound or he can make known his message by imitating the sound of a telegraph key.

A Scout is kind to everything that lives. He knows that horses, cats and dogs have their rights and he respects them. A Scout does a Good Turn every day, and he does not consider the day complete until he has helped some other person.

A Scout knows that people expect more of him than they do of other boys, and he guards his behavior so that no reproach can truthfully be brought against the great brotherhood to which he has pledged his loyalty. He seeks always to make the word "Scout" worthy of the respect of people whose opinions have value.

The Boy Scout

The Boy Scout is a patriot. He seeks to emulate the great Americans who have had a high sense of duty.

A Scout is a patriot and is always ready to serve his country at a minute's notice. He loves "Old Glory" and knows the proper forms of respect to it. He never allows its folds to touch the ground. He develops a strong body, an alert mind and an unconquerable spirit so that he may serve his country in need. He patterns his life after

those of great Americans who have had a high sense of duty and who have served the nation well.

A Scout chooses as his motto, "Be Prepared," and he tries to prepare himself for anything—to rescue a companion, to ford a stream, to gather firewood, to help strangers, to distinguish right from wrong, to serve his fellowmen, his country and his God.

The Scout is a "friend to all and a brother to every other Scout."

To become a Scout, a boy must be at least twelve years of age. After meeting certain requirements he is first enrolled as a Tenderfoot. He must learn to do other worthwhile things before he can be promoted to Second Class Rank and still harder accomplishments before he can graduate into a First Class Scout.

When a Scout has passed through certain required stages of the program, the whole field of Merit Badges for personal achievement in special subjects is before him. Every Scout will find something to interest him in these subjects, for they give him a chance to develop his hobbies and to do specialized work under expert guidance, looking forward to a life work. Since there are ninety-two of these subjects, a boy has a wide range of choice. A First Class Scout who meets the requirements may qualify for Star, Life or Eagle rank.

National headquarters of the Boy Scouts of America are at 2 Park Avenue, New York City.

Camp Fire Girls. Camp Fire Girls are members of a nationwide club that offers them the opportunity to engage in creative activities such as designing and making objects of beauty, giving parties, camping, hiking along the woodland trails, planning service to others. Each meeting gives them new ideas, new enthusiasms, new inspiration, for they are vital members of a group of congenial girls of their own age. Every accomplishment that goes to make capable, charming, well-poised women may be theirs through Camp Fire.

Whatever their personal tastes and talents may be, Camp Fire Girls have an opportunity to develop them through the Camp Fire Honors and Ranks which measure the girls' progress in the Crafts they enjoy. An Honor symbolizes a definite achievement in one of the seven Crafts—Home, Health, Camp, Hand, Nature, Business, Citizenship or Patriotism. The three Ranks—Wood Gatherer, Fire Maker and Torch Bearer—are the milestones along the Camp Fire highway.

From the day they join, Camp Fire symbolism opens to each girl a new field for self-expression. Her first activity in Camp Fire is the creation of a name that embodies her most cherished dreams and aspirations. She then works out a design—her symbol—expressing in form and color the ideals that her name perpetuates. As she grows in Camp Fire, following the trail of the seven Crafts, she pictures in the decoration of her ceremonial gown the story of her search for the ideal that her Camp Fire name symbolizes.

She who has membership in the Camp Fire Girls is privileged to follow the Trail of the Seven Crafts, which leads through the Land of Happy Girlhood.

There are priceless treasures hidden along the Trail—treasures of joy and health and courage, joy in the companionship of her sister adventurers, joy in bringing to the humblest task the touch of loving craftsmanship, health that makes it possible to live each day richly and fully, courage to face life fearlessly. At the end of the Trail lie the broad acres of the Kingdom of Happy Womanhood—heritage of the Camp Fire Girl.

Any girl over ten years of age is eligible for membership in Camp Fire Girls. A group may be organized with as few as six girls, but each Camp Fire is limited to twenty members. A woman over eighteen years of age acts as the leader. She is known as the Guardian of the Fire. This leader writes to the Headquarters of the National Council, 41 Union Square, New York City, for an application blank, and the girls plan to earn their dues of one dollar each. When the application

Camp Fire Girls' Cabin

This cabin was planned and built by the Camp Fire Girls of Keota, Iowa. They use it for summer camping and for all-year-round week-end trips.

blank, properly filled out, is returned to the National Office with complete dues—one dollar for each girl and the Guardian, and one dollar charter fee—a Charter and a Guardian certificate are sent and the new Camp Fire is officially registered, each girl receiving from the National Council a personal Certificate of Membership.

For each Camp Fire Girl there begins a new chapter—the making of new friends, the broadening horizon of new interests, the fun of being at home out-of-doors—the joyous experience of good times shared with others in Work and Health and Love.

Girl Scouts. The underlying purpose of the Girl Scouts is to give girls a happy, healthful time in camps, troops and Little Houses, and, at the same time, to develop in them the habits and skills which will be useful to them in later life, whether they are mothers, home-makers or professional women.

The Girl Scout program is designed to increase health, practical skill, initiative and self-dependence, and to bring out talents and capacities by which the individual girl may earn her living and enrich her life.

Camping is a favorite activity of the Girl Scouts. There are approximately 440 Girl Scout camps. The Girl Scouts have been pioneers in the small unit system of camping which permits the girls in camp to live in small groups, each with an encampment to itself. The organization has also led the way in the training of camp leaders.

Girl Scouts in 150 communities have Little Houses; that is, small clubhouses built like real homes, with kitchen, dining and living-room, bedrooms, and sometimes gardens. Here the girls make home-making a delightful game and a real experience. Some of these Little Houses have been established in connection with the Better Homes movement. The Washington, D. C., house, for instance—a replica of the boyhood home of John Howard Payne, author of "Home, Sweet Home"—was built by the General Federation of Women's Clubs and presented to the Girl Scouts.

Educators and psychologists have arranged a program of over fifty activities, proficiency in which is rewarded by a merit badge to sew on the sleeve of the uniform. These pursuits fall into four general classes: home-making, health, craftsmanship and art, and community service. Home-making in all of its phases is generally the most popular Girl Scout activity.

The Girl Scouts is open to any girl who will subscribe to the Girl Scout laws. These set forth that a Girl Scout is honorable, loyal, useful, friendly, courteous, a friend to animals, obedient, cheerful, thrifty, and clean in word, thought and deed.

In 1930 there were approximately 200,000 Girl Scouts, mostly between the ages of ten and eighteen. It was estimated at that time that 1,000,000 American girls had had some measure of Girl Scout training.

The national headquarters are at 670 Lexington Avenue, New York City. There are state headquarters in every state, and local headquarters in hundreds of American communities.

Four-H Clubs. Of the 12,000,000 rural boys and girls in the United States, something less than 1,000,000 belong to an organization known as the 4-H Clubs. The four "H's" signify the four-fold development of the Head, Heart, Hands and Health. The Clubs are organized under the supervision of the Agricultural Colleges and the United States Department of Agriculture. In the extension of the movement they are assisted by the National Committee on Boys and Girls Club Work and many other organizations which contribute support to the movement in one way or another.

Each local club composed of from five to fifty or more members ten to twenty years of age, has its own officers consisting of president, vice-president, secretary-treasurer and reporter. The club is also under the supervision of a local leader. Meetings are held weekly or semi-monthly. In addition to discussing the project in agriculture or home economics in which that particular club is engaged, provision is made for recreation and a social good time at each 4-H Club meeting. Thus the 4-H Club group frequently becomes the center of social affairs in rural communities.

A growing activity of the 4-H Club Movement is that of camping. More than 300,000 4-H Club members participate in camping activities each year. In many states there are in addition to local camps, county camps, inter-county camps and state camps. At the camps club members come into close association with specialists from the Agricultural Colleges from whom they gather at first hand many practical and interesting facts from nature in addition to participating in the usual activities such as is afforded by camps, for example, swimming, group singing and games.

In most states a Short Course, Club Week or Round-Up is held each year at the Agricultural College which is attended by from 250 to 3,000 outstanding representatives of the 4-H Clubs. At these meetings a work-study-play program is carried out. It is a common practice to conduct competition for state honors in demonstrations; health scoring examinations; judging of articles of food and clothing or livestock and grains. It brings rural boys and girls in direct contact with the Agricultural College—its teaching staff, its experiment station and its extension force—and makes known to them the value of the state and federal supported institution and shows them how to make the proper contacts in order to make the most out of the college and its force.

"Going to the Fair" had a different meaning a generation or so ago than it does to the modern 4-H Club member of today. At one time the chief attractions at the fair for the average rural boy and girl consisted of a ride on the "ferris wheel" or "merry-go-round"; sufficient pop, peanuts and ice cream; and a chance to see the horse races and evening fire works. Scarcely any attention was given in endeavoring to attract rural youth by means of educational exhibits, contests or what not. Today the situation is entirely changed. Every fair—county, state, sectional and national—has its 4-H Club department. Rural youth looks forward eagerly to the opportunity of exhibiting livestock; to competing in judging contests; to demonstrating the various approved practices in agriculture and home making, and to joining in a parade before the grand stand to visualize the spirit and progress of their club. Many county fairs are devoting a large proportion of their prize money to attracting exhibits from 4-H Club members. In one state the appropriation for 4-H Club activities provided by the average county fair is said to be $500.00. Indeed, many local fairs which have failed under the old system of operation have been revived by 4-H Club members and largely if not entirely manned by the boys and girls themselves. The larger state fairs appropriate up to $25,000 annually for 4-H Club prizes.

At the larger fairs and expositions arrangements are usually made for sight-seeing tours. Thus 4-H Club members are given opportunity to see art galleries, museums, zoos, public buildings, private industries and points of historical interest in the various cities. In all their activities they naturally come in contact with public officials and leading citizens, thereby gaining inspiration.

The fourth "H" of the 4-H Club program stands for the development of health. This has come to the attention of the public and the boys and girls very markedly within recent years. In practically every state 4-H Club members are taught to "play the health game," that is, to eat properly balanced foods at regular intervals; to sleep with open windows; and the necessity for such habits as frequent bathing and cleaning of teeth is stressed. Club members are also shown how to use exercises to correct improper posture. To add to this interest a large number of counties conduct county health scorings. In such states county champions are eligible to compete in state health contests conducted by the Agricultural College officials. During the National 4-H Club Congress held annually at Chicago, these state champions are scored and the national blue ribbon winners determined. "Health" means "wealth" to rural boys and girls as it does to everyone.

But more than that, 4-H Club members are learning to evaluate themselves and to find their proper niche in life. They are discovering the mysteries of Nature—the miracles performed by growing plants. They are learning to observe beauties around them which previously their eyes could not see. In short, 4-H Club work is teaching rural youth how to live and to get the most enjoyment from life.

National headquarters are in the London Guarantee Building, Chicago.

The Woodcraft League. The Woodcraft League of America was founded in 1902 by the naturalist, Ernest Thompson Seton. It has three distinct divisions—the Little Lodge for children under twelve; the Big Lodge, for boys and girls up to eighteen, and the Adult Lodge for men and women over eighteen. It publishes the Birch Bark Roll, which is the official handbook and contains much valuable information and reference material on the organization of Woodcraft tribes, the conducting of council fires, town and camp activities, Indian lore and dancing, Nature songs and games. It is supplemented by the Scroll of the Little Lodge, which contains the coup standards for those under twelve years of age.

Woodcraft is aptly said to be a "man-making scheme with a blue sky background." Woodcraft is an all-year-round program of recreation, tending to develop the imagination. It involves both outdoor and indoor education. It emphasizes individuality as opposed to standardization.

The activities of Woodcraft are carried on through the Body Way, the Mind Way, the Spirit Way and the Service Way. The four-fold Law of Woodcraft is summed up under the Lamps of Beauty, Truth, Fortitude and Love.

National headquarters are at 1043 Grand Central Terminal Building, New York City.

CAMPING

One doesn't camp out in a cabin or bungalow with hired chefs and a community dining-room. He brings his house with him on the running board or under the wagon seat; he cooks his own food; if he wants furniture, he makes it with an ax. Real camping is a return to the primitive—the butcher, the baker, the candlestick-maker are barred. At its best, there isn't even a guide. The instinct for returning to simplicity is strong in most of us, but we have come so far in our way of civilization that few of us know how to get back. This article is for the folks who would like to join the big procession returning to their father's house in the woods.

Where to go doesn't so much matter. Little journeys will often do as well as long ones. The main thing is to cut loose from routine—to get an utterly new angle on life. This may sometimes be as well managed by a creek bank over the next hill as in the Canadian wilderness. But if one has a few weeks off and a little car, he may almost choose his own camping ground; let him try the mountains this year, the lakes and rivers next, and after that the sea itself. Which he will like best will depend on his temperament, but he will be the richer for all three.

Preparations for the Trip. *Outfit in General.* Long before your date for starting has arrived, begin a check list. You can have fun with it all winter, and it will assure you against omitting any important items which you would surely forget if you tried to make up the list at the last moment.

Broadly speaking, you will have to provide: shelter and bed, fire, cooking and eating implements, food and food-getting tools, a personal kit, and sundries for safety, comfort and pleasure. Every item that you admit to your list must prove its right to be there, and, since one car (quite likely a small one) will no doubt have to carry a party of four and all its duffel, every item should be checked in the light of these questions: Can I get along without it? Is it as light and compact as possible? Is it durable? Is its design right for camping?

Duffel Bags. The entire camp luggage for a party of four people who are planning to stay several weeks should be packed in no more than seven waterproof bags. There will be four bundles of bedding, clothing and personal effects; one bundle will contain tents, flies, jointed poles, stakes and extra canvas. One bundle will have the food, table ware and camp sundries, and the seventh bag will contain the stove and stove furniture. Clothing is best kept in light muslin sacks which serve for pillows in camp; incidentals of personal property are put in the pockets of the sleeping bags or enclosed in smaller sacks within the clothing bags. There should be no loose odds and ends whatever, for they are always very much in the way.

Loading the Car. A folding baby gate makes the best carrier for the running board. It is light in weight, high, long as you want it, strong enough for the purpose and inexpensive. Fasten it with angle irons at the bottom and with ropes or wire braces at the top. The tent bundle is long and flat, on the right running board under the doors. A few harness clips on the running board are useful and inconspicuous. If the front fenders are strongly braced, there will be a bundle on each, tied to the headlight irons. Four bundles will fit in the baby gate, one on the right running board, two in front. Of course if you have tonneau room, you can either bring in two bundles from the outside, or take along a few extra comforts.

Camps by the Way are one night stands, very simple, commonly set up at twilight. It is best to turn off the main highways a mile or so along a side road, where you can either set up your house by the side of the road, or get a farmer's permission to stay over night in his orchard or meadow. A courteous statement of who you are, where you are from, where you are going, and what you want will almost always be met halfway. To make sure that this condition lasts, always endeavor to return as many favors as you get.

On long trips, the storage battery may well be used for lighting your evening camp.

Of course the simplest roadside camp is a lean-to of some sort, fastened to the top of the car. Automobile tents may be had for

this purpose, though any sheet of waterproof duck or twill will do. An excellent scheme is to use the fly from the wall tent combination, fastening one end to the car top, the other end to the two wheels, and staking the middle out on the ground with a board or pole running through, so that the one canvas serves for both roof and ground cloth. This is a capital arrangement when the grass is wet. A rehearsal or two at home before you start will prove it practical to sew a few tapes along the ground line of this fly tent, for staking out. By this device, night camp may be set up in five or ten minutes, with dry beds and an excellent shelter. With this arrangement, you will study the direction of the wind before you stop your car in bad weather. A few extra pairs of tapes along the sides of the fly may help in shutting out a driving storm. It certainly pays to make up your beds in the waterproof rolls described later in this article. With such rolls, four beds can be made in four minutes—there's nothing to do but unbuckle and unroll—and a little rain more or less doesn't matter.

If the weather is fair, it is a waste of time to put up any shelter at all. No other sleeping room can compare with the unroofed open air.

The Headquarters Camp. *Shelter and Bed.* East of the Rocky Mountain states, there should certainly be a tent or two for each party. Two 9x9's or one 10x12 will make very comfortable quarters for four. The requirements of weight and bulk forbid the use of heavy duck. The use of shelter tent duck or the best grade of twill for all sizes up to and including 10x12 is recommended. Tents of these materials may now be bought ready-made from any of the better dealers in outing goods, or may be made up to order.

There are half a dozen or more standard shapes of tents, but of these, two are pretty clearly the all-round styles for general use. Women are quite sure to prefer wall tents, with 8 ft. poles and 3½ or 4 ft. walls. Men who know are about as unanimous in choosing the lumberman's style, lean-to roof, 8 or 9 ft. poles, low rear walls, and an upright front. This front may be staked out awning fashion, thrown back on the roof or tied down to close the tent. The lumberman's tent is thus convertible into three. It is a lean-to with warming fire in front; it is a living room with a front porch; it is a snugly closed house.

Whatever the style of tent, there should be an 8 or 9 in. sod cloth around the bottom, and some good drop screen in front, to keep out vermin, flies and mosquitos. A front of double mosquito net or single bobbinet is effective. It is well to have a broad band of cheesecloth at the top, bottom and sides of the curtain for wear and tear, and for surplus tucking in. A few minutes' attention to sod cloth and drop curtain will positively shut out the whole horde of flying and crawling night pests.

If carrying space permits, the headquarters camp will be greatly improved in hot or rainy weather by the use of a fly over each wall tent, extending well out in front for a porch.

In a country of wooded undergrowth, it is commonly unnecessary to carry poles or stakes; but if the journey is a long one and a tent is to be set up every night, it may be well to carry half a dozen stakes, and to put ferrule joints in light end poles cut to the length of your tent bundle. If your tents are made with a ridge of rope or tape, as they should be, you will not need a ridge pole on the way. Ridge poles should always be used in permanent camps, to gain head room and preserve the shape of the tent.

It is well to floor the ladies' tent with a waterproof ground cloth, of material like the tent. A ground cloth of some sort is particularly desirable for camps set up by the road in the evening. It makes a neat cover for the bundles in the baby gate.

Waterproof your tents, flies, ground-clothes and duffel bags in a paraffin solution. Melt a pound of Parawax for each six quarts of gasoline, pour the hot paraffin into the gas, and proceed. Dipping does the more thorough job, but brushing will do. Articles waterproofed in this way should be aired for several days before being used, in order to evaporate all the gasoline.

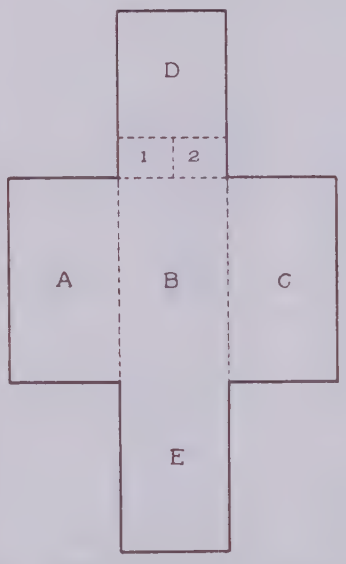

Diagram of Camp Bed
The story explains the use of the lettering and numbering of this diagram.

Beds and Bedding. Sleeping bags are bulky, heavy and expensive, but a home-made blanket roll will pay for itself in comfort, especially if the nights are cool, or if one likes to sleep in the open. The roll which is generally recommended is made up in a simple cross-shaped cover of waterproofed twill, with tapes for tying, or rings and a strong cord for lacing up. If the sleeper uses a cot, he must have as many thicknesses of blanket under him as over; if he sleeps on the ground, there may be a blanket or two less under than over. In any case, the proper way to make up blankets for a single bed out-of-doors is this:

Lay the twill cover out flat. Spread one blanket in position BC, another in position AB; Fold Blanket C over B; A over B; cover flap E over B; C over B; A over B. Lace and tie, leaving a little freedom, for comfort. If more than two blankets are needed, fold all but the top one alternately, as above; the top one may well be tucked in at both sides. Flap D is a head cover, with convenient pockets for odds and ends. This head flap for out-of-door sleeping is held up from the face by a cross-bar resting in forked sticks. The lower ends of D are of course tied down. It is impossible to kick out of a bed made up in this manner; wind and weather cannot get through it.

A few newspapers under the bottom blanket of any bed will do wonders for warmth.

Lacking a natural mattress for your ground bed, one may be improvised of almost any leafy material—ferns, juniper, branches from any of the evergreen trees, small brush, sweet clover—whatever comes handy. For real comfort, juniper is perhaps the best of the lot, though it is unpleasant to handle. If branches are used, they should not be thrown down haphazardly, but should be laid in courses like shingles, covering the butts. Ground beds in the permanent camp should be made in two layers, a lower one of coarse stuff, and a finishing coat of tips, ferns or leaves.

Occasionally one may find it necessary to sleep on bare ground. This will be better if hollows are dug for the hips. A form-fitting bed of sand is more comfortable than prodding branches badly covered.

The Camp Kitchen. It may be well enough to know how to make a fire without matches, but it is vastly more important never to forget the matches. Flint and steel, burning glass and fire fiddle will not be needed if there is a good reserve stock of matches in camp and in your pocket, and be sure always to keep them in waterproof containers.

Headquarters camp should have some means of baking. Kettle ovens and steel camp stoves are heavy, consequently many people always strap on the car somewhere a light four griddle, sheet iron stove, with an oven. This is admittedly a bulky package—its actual dimensions are 11x16x22 inches, and its weight 14 pounds—yet such a stove should be carried if at all practicable. It takes most of the hardship from your permanent camp; reduces the bulk of firewood required; raises the fire off the ground so that the cook can stand erect, and makes possible a comfortable tent on cold, rainy days, and in the evening.

If the stove cannot be carried, a folding reflector is the next best thing, though it is possible to improvise ovens of many sorts. For example, a meal of potatoes, muffins and corn pudding can be baked at the same time in one galvanized bucket. An overlapping cover makes an oven out of a frying pan. The regulation meat baker used at home will itself serve very well as the camp oven. Potatoes, corn and fish may be baked in hot embers under the fire. The corn is protected by its husks, potatoes are delicious in their charred shells, but the fish will need a protection of wet paper. Boy Scouts learn to bake a twist of dough on a stick held near the fire. Suit yourself. Half the fun of camping is in inventing new ways to do old things.

No breakable utensil should go to camp. Aluminum ware is preferable except for dishes which must be held in the hand. It gets hot quickly and stays hot long. On this account aluminum cups are quite out of the question, except for cold drinks. Aluminum fry pans

are excellent, if they have the right sort of handles. A light 12-inch fry pan with a smooth flat bottom gets our vote as the all-round best camp kitchen tool. It should have a socket for a long wooden handle, in case you need to fry over a big warming fire. Next to the fry pan in importance come three or four nested aluminum stew pans or pails. Of course all handles should be riveted, not soldered on. Don't forget the long handled spoon or the pancake turner. You *can* do without them. Guides enjoy the flourish of turning cakes by flipping the pan in the air, but what's the use, if the results are inferior?

Food. The question of food all depends on who you are, where you are going, how long you are going to stay, and what time of year it is. Camp is a bad place for finicky individuals. But most people will eat in camp things they refuse entirely at home. The two general tests for a food list are: (1) What items can we surely depend on from the country we camp in. It is well to discount this expectation pretty heavily. The fish do not always bite; a late frost may have killed the berries; we are hungrier than we expected to be. (2) Are our staples of the lightest possible weight for their food value? Rice will do more for us than potatoes, at a fraction of the weight and bulk. Bacon is easily the best camp meat brought from home. Sugar, oatmeal, cornmeal and flour are high in value for their bulk. Dried fruits must always be included for their medicinal qualities. Condensed milk is less bulky than the evaporated sort, and keeps better after opening. Butter is a luxury worth carrying. Pack it in the lightest tins you have. If one's camping is to be really strenuous and in far places, he must dispense with canned goods altogether. Dehydrated vegetables, eggs and even powdered milk are practical, and growing in favor.

Always carry a few hooks and lines. The rods do not so much matter. There is a peculiar exasperation in the sight of game fish, or any other pan fish, when one has no tackle. By the same token, carry an accurate .22 rifle, or a .22 pistol with six-inch barrel, the lighter the better. Red squirrels and woodchucks are usually in season, and you are not a shrewd camper if you scorn them.

In many states, one may fairly count on wild berries—strawberries, raspberries, blueberries, blackberries—in succession, from May until August. On the New England shore, wild cranberries are ready late in summer. There are spots along the Great Lakes, in the mountains—best of all on the coast—where the combination of wild riches, free for the taking, is true beyond dreaming, from snow to snow. To get the best you will of course steer wide and clear of all beach resorts, hotels and popular summer camping grounds. We are still a young enough and big enough land for this happy appropriation of a common treasure, off the beaten track.

Personal Kits. By this time it will be understood that conventional traveling bags and cases are out of order in camp. One change of clothing, in a light muslin sack, is useful for a pillow at night. Give particular attention to the comfort of your feet. Conventional notions about the dangers of getting wet will require a larger wardrobe than campers need who have exploded this fallacy. But a poncho is comfortable in a pouring rain, and wet clothes are a bit clammy to sleep in or to put on in the morning. There is of course no family wash in camp. Put into your kit all the things you must have for health and for a reasonable degree of comfort, but omit decorations for a while. It will make a noticeable difference in the load. Odds and ends of toilet articles are best kept in the pockets of the bed roll. Positively no personal property goes that cannot be packed in your one duffel bag, along with your blankets and clothing. Be sure to put in a pocket compass, a jackknife and a waterproof match box of some sort.

Camp Sundries. Candles or candle lanterns are better for camp than oil lamps of any sort. Camp axes are sheathed, and carried in the duffel bags. A bucksaw may be worth carrying, if you use a stove, or if you tinker much about camp. Remember soap, towels and an old rag or two. Nails are very useful—a pound of 10's, a pound of 20's, and a half pound of 6's. Take 50 feet of small cotton rope, braided if you can get it, and some stovepipe wire. A pair of white cotton gloves will be convenient in case there are fish to skin. There is a knack, for instance, of drawing the edible part of a bullhead away from the rest, with half a dozen simple motions, if you have a sharp jackknife and a pair of cotton gloves. Be sure of a whetstone, carborundum preferred.

Carry maps of the regions you are to visit. If the United States topographical survey has covered the regions, get the map of every quadrangle which may interest you.

Except in a hunting party, one or two light guns are enough, and more are a nuisance. Always carry one or two small cameras—the smaller the better—if the lenses and shutters are good. Small pictures are good mementos, and the occasional lucky composition can be enlarged. Mosquito bite preventives and remedies should be carried in spring and summer. Any aromatic oils are useful—cedar, pennyroyal, peppermint, camphor; oil of pine is effective, but not good to look at. Citronella is the stand-by. Use a little olive oil or melted vaseline for a base. Put up as many one-ounce bottles or boxes as there are members in your party, and keep one larger bottle in reserve.

Working Hints About Camp. In locating your camp, water, wood, shelter, bed, drainage and permission are the main things to consider. Sometimes it is necessary to beware of the dog, but that speaks ill for the location. The writer once found it necessary to make a funeral for twenty-five porcupines before camp duffel could be safe. Granted the necessities named above, one begins to be grateful for such bathing pools, bird songs, waterfalls, vistas, fruits, fish, game and sunshine as are available.

Fires. Big open fires are unpleasant for general cooking purposes, even in winter. If you must have a big fire for warmth, study the wind, and locate a small cooking fire so that you can work between the two. A fire built for cooking only should be small, directly under the cooking utensil and close to it. Makeshift fireplaces do very well for short stays. Narrow trenches, parallel lines of rocks, tripods of stones, sharpened green sticks driven down in threes, two logs a few inches apart at one end, and separating slowly for the larger utensils—these are a few of the simple devices. Forked sticks will support a pole above the fire, and from this horizontal pole, smaller forked sticks in various lengths will carry the cooking pots. Six foot saplings make good swinging cranes. Fire irons and patent grids are of course very convenient.

Lighting the fire is an easy task in dry weather, but it is quite another story when the ground is wet, and all the fallen sticks are soaked through with rain. A hot little fire is what you must plan for first. Get the materials for your fire before you strike a match. It is almost always best to lay your fire before you light it. It is well to recognize several kinds of fire materials: tinder, anything which readily takes fire from the flame of one match; small dry twigs or split up sticks which kindle from the tinder; middle-sized sticks, broken up; larger sticks, left unbroken, and thrust in as they burn. If coals are wanted for broiling, hardwood sticks several inches through are best. Always, the hot little fire first. Birch bark, white or yellow, will burn in any weather. But woodman, spare that tree! Cut it down if you must and if the law allows, but don't disfigure it with a knife. Pull off loose fringes with your hands, or find a dead tree and work your works on it. Standing dead stuff is of course drier than ground wood in wet weather. The lower branches of evergreens die first, and may always be counted on, if they are there. Break them off, split them and whittle, if you have no birch bark. Gauge and grade the size, the dryness and the kindling heat required for all the materials at hand. Any sound deadwood is likely to be dry at the heart, so the ax and pocket knife, with common sense, will solve the fire problem.

Safe fires are not built on dry peat or leaf mold. Rocks, bare soil, creek banks, or raised fireplaces are safest. Fire is of course particularly dangerous in a dry time of high winds. Let your fire run, if it will, several yards out in all directions from the starting point. The one rule for safe fires is, watch them while you're in camp. And put them out when you go away. Night fires should be used only under conditions of known safety. Tent stoves are best for that purpose.

Comfort in Camp. The convenient and comfortable camp is near water and wood, is waterproof and shaded by a fly, requires little stooping, has a place for every utensil, good beds, a table or two and portable seats. Camp without these is no place for old folks, for women, or families, beyond the first day or two. But with these things, and a fair division of labor, there is little hardship in camping. It is understood that all camp furniture is made in camp. Bucksaw, nails, and nail-pulling hand-ax make quick work of it. Tables, benches, and chairs can be sturdy and portable only when they stand on four good legs, each leg braced two directions at right angles. Wire 6's are best for fastening these braces. It is a simple matter to put backs on the benches and chairs. If you take along some extra canvas, hammocks, cots and reclining chairs are in your repertoire.

Hints on Camp Cooking. Fry fish slowly, in fat as deep as you can spare it. This means a small, steady fire and frequent turn-

ing. Roll your fish in a mixture of corn meal and flour before frying. If you turn a trout or flat fish a few times before leaving it in the pan, it will lie without curling.

Stews are easily possible. Red squirrels, woodchucks and cottontails are available when other things fail. Dehydrated vegetables in a stew will probably require longer cooking than your meats. If you have fresh vegetables, study their boiling periods and add each at the right time to bring all together at the finish. For instance, do not put in the potatoes until the meats begin to be tender, with twenty-five minutes to go. A slow simmering fire is the thing for stews. Add butter, salt and a thin, smooth batter of flour—not much of it–a few minutes before serving.

In baking, remember one rounded or heaping teaspoonful of baking powder to the cup of flour. Gems and muffins need a cup of milk (solution of powder or dilution from tin can); an egg or its equivalent in egg powder; tablespoonful melted butter; sugar and salt to taste, the whole stirred with flour of any sort to the consistency of well-cooked mush. The mixture should run, but slowly.

Pancakes are more tender made with water than with milk. It is well to take along some prepared pancake flour.

Too much baking powder is better than too little.

Johnny Cakes are better of half wheat, half corn.

For *puddings*, boil rice or corn mush; stir in milk to a thin batter; add beaten egg or egg powder, raisins, sugar and nutmeg; bake until brown.

Steaks, chops, fish can be *broiled* in camp as well as at home if you bring along a camp grid or a folding bread toaster. Use a bed of live coals. Wire the broiler handle to a stick, if you find the heat unpleasant.

Planked meats are more readily prepared in camp than at home.

There is no better way with small game than to boil it until tender, and brown it with butter in the frying pan.

Fish Chowder. A kettle or big stew pan, with layers, in turn, of pork, fish, sliced potatoes and crackers. Long, slow simmering. Keep covered with water.

Baked Beans. Layers, from the bottom upward, of onion, beans, onion, pork, beans, molasses, covered with water. Beans previously boiled until nearly tender. Both the chowder and the beans will be much better if they can be baked in a fire-hole. This requires a covered kettle, a rock-lined pit, and enough live coals to bury the pot completely. Layer of ashes on top. Get this pit in action at noon, and a delicious hot supper will be waiting for you at night. The pit itself is of course first heated by a fire built for that purpose.

Coffee. The good rule in making coffee is to use a tablespoonful to the cup, and one for the pot. Don't boil your coffee; let it come slowly to a boil, and then merely keep it hot till you are ready for it.

One of the very best things about camping is that there may be so complete a change of work that we call it play. We have a new set of cooks, for out-of-doors it is the men's turn to cook, at least until the kitchen is made easy to work in. Even at that, the ones who cook at home need a change much more than the men. In general, men's camp cooking is likely to be greasy. Better make an art of it. Digestion will approve, and there is fun in the game.

The Hiking Camp. For outfit, take only what each man can carry comfortably on his back, perhaps around thirty pounds, complete, packed either in a duffel bag with harness, or in a pack basket. The basket holds its shape, does not jam the contents, is cooler to carry, but is not waterproof. The basket wins by a big margin, if you can protect it from rain.

Small waterproof bags, stamped or tagged, are very useful for dry foods and sundries.

In midsummer, a shelter tent (pup tent) with a blanket or two and a liberal square of mosquito net will be advisable; but in cooler weather, a well made bedroll is rainproof, dampproof, windproof, coldproof—all the house you need.

For a hiking trip in the woods, one should plan each meal in advance, making them all very simple, of condensed nourishment, and carrying only such dishes as are positively necessary. There should be a change of gear for the feet, but a poncho will probably make further change unnecessary.

Real hikers find the improvised camp most interesting of all. But it is possible to overdo the impromptu feature of the game. When you set out for a long walk in the woods, it is always well to have along the half of a dog tent, a tin of meat or cheese, a compass, and a loaded waterproof matchbox. If you lose your sense of direction in the woods, and haven't a compass, stop traveling! Sit down, cool off, think it over, wait! Recall where your camp is placed; review the landmarks on your way; reflect that water runs down hill, that moss is heaviest on the shaded side of trees, and that the worst possible thing to do is to lose your head and rush around.

Perhaps the last word about wandering alone in the big woods is not to do it, until you have a sure and tested sense of direction, and a habit of really seeing and remembering the landmarks you pass, looking back at them as well as ahead.

CANOEING

Paddling one's own canoe over thousands of miles of inland waterways is an immensely popular sport. Here and there is a group of canoe sailing enthusiasts with their arguments, their races, their elaborate contrivances for carrying more and more sail, preserving balance, and resisting side thrust. Folding centerboard outriggers, seats sliding far over the side, and a big sail together make a craft which only an expert can handle without coming to grief. Obviously, all canoeists should be good swimmers, whether they get their thrills by shooting rapids or by coming about in squally winds under full sail.

Beginners in paddling might be glad of a suggestion or two. Let your canoe be light, but strong. Some of us prefer spruce, and like to shape our own, thin and broad. In any case, before a long journey is done, you are sure to appreciate lightness of outfit, canoes, paddles and all.

All popular canoe models are now made of canvas covered cedar.

Two paddlers make more than twice as good headway as one. They neutralize each other's side thrust. Every moment's use of rudder or paddle to change the course is a moment of lost energy. The through traveler makes no unnecessary zigzags.

Learn to steer with your stroke. No matter on which side you are paddling, turn the inner edge of your paddle back a bit, and strike parallel to the course, as usual. The angle at which you hold your paddle as it goes through the water will determine whether you turn to right, to left or go straight ahead.

CAPTAIN BALL

Eight small circles three feet across, two large circles five feet across, placed as in the diagram. Captains stand in the large circles, supported by teammates in small circles. Guards may not step across any circle line

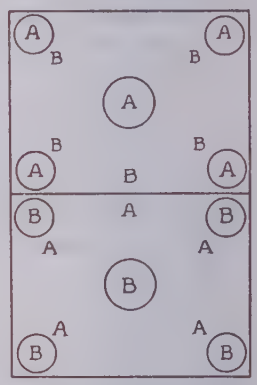

Diagram of Captain Ball Floor
Showing the positions of the members of the two teams, A and B.

and men in circles must not step out. Ten men in each team are placed, as shown by letters A and B. Balls which come into the captain's hands count a point for his team, but only his circle men may throw to him. The business of the guards is to block opponents' throws and secure possession of the ball for their own circle man and captain. The game starts like basket ball, with a jump between the captains' guards at center.

CRICKET

Cricket, a national favorite in England, has taken little more hold in America than baseball has with the Britons. Cricket is much like the "two old cat" of our country school days. In place of the two bases for the old cat game, stand two "wickets"; each wicket is a set of three posts twenty-seven inches high, carrying a loose block of wood called a "bail." The posts must be too close together to let a ball through between them, and must be sensitive enough to make the bail fall off if a pitched ball hits the wicket.

Four feet from each wicket, toward the other wicket, is a line marking the batter's position. Two batters are up at once, one by each wicket.

The game is played by two opposing teams of eleven men each. In each inning, all the players come to bat. While one team is at bat the other is in the field. A pitcher stands beside each wicket and each pitcher throws in turn at the opposite wicket. If he can hit his mark, the bail will fall, and the batter at

that wicket will be out. It is the batter's business to hit the ball before it strikes the wicket.

All batted balls are fair hits, and each hit requires the two runners to exchange places. Meantime, if the batted ball is caught on the fly, or if a bail can be knocked off by a ball in the hands of a wicket-keeper before the runner due at that base arrives, that runner is out. There are thus three methods of putting a batter out.

The batsmen may make several runs for each hit if they have time, and since the bats have a flat surface and the game is a long one, the score often runs into hundreds.

CROQUET

Croquet is a popular sport in this country. It had its origin in France and it is said to have been brought from there to Ireland and then to England. Public matches of croquet were played in England as far back as 1867. It was popularized especially through the "All England Croquet Club." In America it is a game that is commonly played on the lawns of farm and city homes. It is also a popular game for municipal parks and country clubs.

It is simple to set up and the upkeep is not expensive. It is a game of skill and requires keen coördination of eye and hand. It is played on a court thirty feet by sixty feet. Any level, smooth grass plot is excellent. The boundaries can be marked with a white cord. At each end of the court there is a colored stake. On each stake is a red, a white and a blue circle. Balls are made of wood and are painted in colors corresponding to those on the stakes. The more expensive balls are of hard rubber. These will outlast the wooden balls and are much better. There are ten wire wickets in a court. At the start the wickets are placed four inches apart and as skill and accuracy develop they can be placed farther apart to make the game more difficult. Four wickets are placed at each end of the court, two directly in front of the stake, and one on either side of those two near the boundary. There are two wickets in the center of the court. Wooden mallets are used to drive the balls over the court and through the wickets.

Two people may play or three teams of two each may play. The ball is started from one end of the court directly in front of the stake and the object of the game is to get the ball through all of the wickets to the other end of the court and back to home stake before other players reach home stake. Players take turn in playing their ball. When teams are playing, alternate turns are taken from opposing teams. As the ball goes through one wicket it entitles the player to one more stroke. Each player takes his turn and the game gets complicated and more interesting as the balls come close together. A player is permitted to play upon others' balls, giving him additional strokes to go through the wickets. When teams are playing the game is not won until both balls of a team have gone through all the wickets and returned to home stake. Each of the players on a team gives his partner every advantage and they try to keep both balls together over the course.

FISHING

There is much truth in the old saying:

When the wind's in the west
Fish bite the best;
Wind in the south
Drives the bait in the fish's mouth;
When the wind's in the east
Fish bite the least;
When the wind's in the north
The fisherman goes not forth.

But all such maxims are only general. The writer's guiltiest memory of an overcatch goes to a day of northeast wind; and he has found many a spot where the "wise natives" could tell, if they would, when the signs were right in the lakes and streams near by. If you come across somebody who has the reputation of always catching fish, get acquainted with him if you can. He has studied or stumbled his way to a revised version of proverbs. Perhaps he just knows where the fish are and what they are doing today.

This should make it plain that any statements about the sure way to make "big-heap-catch" of fish will be on the average six or eight parts bunkum in ten. So even this discussion is condemned to begin with. But try it.

If you need bait, try crickets and grasshoppers which are sleepy and stiff early in a cool morning. Bass like hoppers as trout like flies.

The unexpected wakes up the big slow fellows at the bottom of the pool. Give them a swimming frog, a mouse or a devil bug of some unearthly design.

If you can not catch frogs, cut a bit of fresh or salt pork rind to act like a frog when you draw it along in little jerks. Put a triple hook or two on the meat side of the rind.

Night crawlers do crawl at night, if there is dew or rain on the ground. Take a lantern, look sharply, step gently, and end with a forearm snap, a grip and a steady pull. They are game animals. Even small trout seem to prefer one bite of crawler to three whole garden worms.

There is nothing offensive about the larva of a fly, unless you happen to think so. In a very dry time you might do worse than to hang up some defunct creature in the sun, with a pan of corn meal directly below it. Bird-catching tomcats are suggested. Make your plans and arrange your works several days before you need the bait.

For flat fish in the lakes—perch, sunfish, bluegills—always leave an inch of worm to squirm around the point of the hook. The reluctant fellows can't quite resist that. Trout? Hook the worm two or three times through, across. Trout do not nibble.

Corks and bobbers—yes, if the water is shallow or if you are out for occasional biters. At the first sign of steady motion, strike! That is, make a short, sharp pull on your rod to sink the barb of your hook. After that, take your time—the bigger the fish, the more the time.

But if you can keep your bait where you want it, don't use a float. Answer every touch on your hook by a little flip of your rod. In that way you can catch three fish to the one of the fellow who "waits for him to swallow it," or for the bobber to go under.

Live minnows—big ones for big pike; two-inch or three-inch, for perch; middle size for bass. Tie or tack four feet of mosquito netting to two four-foot sticks. Get into the small stream below the big pool and have your partner drive them down to you. Slow troll with a long line for big fish.

Perch live near the bottom. Find the bottom with a sinker heavy enough to show by slack line the moment bottom is reached. Then lift a foot or so. Take the depth in this way whenever your boat has been moved. That is one of the advantages of having a reel on your rod.

The natural feeding grounds of fish are in or just over the edge of weed beds. But in summer midday they are out in the lake—not always deep in the water. Some kind of fish, bluegills for instance, keep during the middle of the day a fairly constant depth of from six to fifteen feet, however deep the lake may be; but there are hours when they fairly lie on top. At such times even bluegills may be taken with the fly.

Bait casting is accomplished in three ways—hand line, long reel pole and short rod with a reel. Each is good sport and has its advantages. The bait rod and reel get the vote for all-round efficiency. Rod and reel together cost from seven to seventy dollars as you will. Get your outfit some weeks before the season opens and practice over all distances, landing weights on a newspaper. An automatic winding reel makes back-lash infrequent, though "old-stagers" hardly approve of such foolproof devices. They are emptying the ponds. In using any artificial bait, plug, rubber or fly, it is important to strike the instant the fish touches the bait. He will promptly discover the fraud, and rid himself of it if he can. The use of live bait for large lake fish counsels a longer wait before striking.

Make your own flies, if you want all the fun there is in it. There is nothing mysterious about it. Dissect a few store flies, beginning at the head. In this dissecting, do not cut where you can untie. You will find that most knots are only half hitches. Your dissection should show the use of a binding thread, the reverse folding of wings, the winding of hackles, herl, silk and tinsel. If you shoot, keep a growing collection of feathers, with plenty of oil of cedar or moth balls in the box. Stand in well with some friends who raise chickens. Keep your eye especially on all game roosters. Feathers from the necks of those birds are the most useful ones in your box. One can do very well without any other hackles, if necessary. Note that binding thread goes round the hook in a direction opposite to all other materials.

Tools and Materials for fly tying. A small vise, from the ten cent store (lacking this, use a pair of pliers, with a string wound tightly round the handles; at a pinch, you can hold these pliers between your knees), hooks, silkworm gut or substitute, wing feathers, hackles, silk floss, silk thread, peacock herl, ostrich herl, shoemaker's wax, shellac, a mounted needle with square bent end.

Begin with the wing in reverse position; then go to the tail; fasten in each feather with a half hitch of the binding thread; carry the thread a few turns forward out of the way; wind on, and fasten in turn, the tail, body of floss or herl, ribs of tinsel or silk twist, hackles, and finally the wings, bent back to position. The fastening of the wings and a

touch of shellac or a tuft of ostrich herl make the head.

Dry fly fishing is the top notch of play in this line. Make the flies small. Balance your wings. Use dry fly oil (all your flies would be the better for it). Use a fine, or a finely tapered, leader.

Fly casting is not mysterious, not excessively difficult, and not very expensive, if you do most of the work on your outfit. Much of the cost of a good fly rod is in the winding. You can do that yourself, if you will study out the trick of burying both ends of your thread.

The back cast is the key to good fly casting. In general, keep it high and put a curve at the far, back end, rather than a whip-cracking snap. Make your wrist do the work. The job is daintier and easier so. Lift the tip a bit just before the flies are to light on the water. That makes them come down more gently. Side casts are useful acquisitions, later on. Be sure to varnish all used bamboo rods every fall. That holds the winding and keeps out water. Save the surface and you save the fish that gets away when your rod is soft. Use highest grade elastic rod varnish—not shellac.

Test every line, especially the first ten feet of it, before you leave home. Don't go out with a line that breaks under eight or ten pounds. Dry your lines every day—storage of wet lines rots them.

Keep the law. That is only fair to the other fisherman, and in the end it is best for you.

FOOTBALL

To a person unacquainted with the game, football seems at first an unintelligible series of falling down and getting up motions. But it is really a highly technical game, full of opportunities for both physical and mental prowess, and governed by very exacting rules.

Football is played on a field 160 ft. by 360 ft. A mid-line divides the field across, and on each side are ten cross lines, five yards apart. Counting from the center, the tenth cross line at each end of the field is a goal line. The area enclosed by the side lines and the goal lines is the field of play. The spaces back of the goal lines, measuring 30 ft. by 160 ft., are the end zones. At the middle of each end zone line stand two goal posts, 18 ft. 6 in. apart, with a crossbar 10 feet above the ground.

Two teams of eleven men each play the game. The general object of each team is to advance the ball toward and across the opponent's goal line. This advance is made by throwing the ball, carrying it or kicking it, subject to rules. The team not in possession of the ball attempts to block the advance, either by checking the progress of the player who carries the ball or by getting possession of the ball itself.

A football game is divided into two halves, and each half into two quarters. The quarters are commonly of fifteen minutes each. A fifteen minute intermission separates the halves; a one minute intermission occurs between the first and second quarters, and between the third and fourth.

At the beginning of the game the opposing captains toss up for choice of goal or kickoff. If the winner of the toss chooses goal, the other side must kick off. At the beginning of the third quarter, the team which lost the initial toss-up has its choice of goal or kick-off. For the second and fourth quarters, the teams exchange goals.

The team which has possession of the ball makes the attack, or offensive. For this attack the opening play of the first and third quarters is a kick-off. At kick-off, the ball is sent into the opponent's territory by a place kick from the holders' forty yard line—the line ten yards from the middle of the field on the attackers' side. Of course if the opponents secure possession of the ball after a kick they become the attacking party. At kick-off, the team possessing the ball may not advance beyond the cross-line on which the ball lies, nor may the opponents come within ten yards of that line, until the kick is made.

There are four general methods of putting the ball in play: punt, drop kick, place kick and scrimmage. As just explained, a place kick is used to open each half game. After a free catch, any one of the four methods may be used.

Until 1922, a touchdown was always followed by a place kick for a try at goal. In that year, the place kick after touchdown was abolished in American intercollegiate football. Instead of place kick after touchdown, the ball is now brought out five yards for one play of any practical sort from scrimmage line.

Definitions and Chief Rules of Play. *Down.* A down occurs when the referee blows his whistle or declares the ball "dead." When a player carrying the ball is so held that he cannot advance, the ball is "down" and either the player or the referee may call it so. If the man carrying the ball is so held by an opponent that any part of his body other than his hands or feet touches the ground while he is so held, the ball is down. Other chief instances of downs or dead balls are: after a touchdown, touchback, safety or goal has been made; in general, when the ball goes out of bounds at the side; after an incompleted forward pass; while the penalty for a foul is being enforced; after a fair catch.

If a team having continuous possession of the ball fails to make ten yards' advance during four consecutive downs, the ball goes to the opponents on the fifth down.

No play may be made while the ball is dead, except as provided by rules for re-opening play in the case.

To make a *drop kick*, a player lets the ball fall from his hands and kicks it just as it rebounds from the earth.

When a player has an opportunity to catch a ball which is in the air from an opponent's kick, he may signal for a *fair catch*, by raising his arm, in which case he must not be interfered with in his attempt at a catch. If he succeeds in catching the ball and takes no more than two steps after catching it, his team is entitled to put the ball back into play by any one of four methods already mentioned —scrimmage, drop kick, punt or place kick.

Forward Pass. Once during each scrimmage, from a point at least five yards back of the scrimmage line, the ball may be thrown forward any distance toward the opponents' goal. Suppose Team A makes the pass. Any member of Team B may attempt to catch the ball, and if he succeeds, may advance with it or call it down, in his possession. If Team A makes the pass, only the end men of the scrimmage line of players at least one yard back of the line in Team A may attempt to catch the ball before it is touched by an opponent. After a member of Team B has touched the ball any player of either side may seek to gain possession of it. If a ball passed forward is not caught, but strikes the ground, either before or after being touched by a player of either side, the pass is incomplete. An incomplete forward pass counts as a down, at the spot of the preceding down.

Foul. Any violation of rules (See *Penalties.*)

Free Kick. A punt, drop kick, or place kick following a fair catch. During this play the side in possession of the ball must not advance beyond the line of the fair catch, and the opponents must not come within ten yards of that line until the ball has been kicked or has touched the ground for a kick.

Goal from Field. A goal kicked from the field during the regular progress of play. Ball must go over the crossbar, or over one of the goal posts. Score, three points.

Hurdling with the ball is not permitted. A player carrying the ball may not hurdle in the scrimmage line by jumping over a player within five yards of the point from which the ball was snapped back. A man carrying the ball in the open more than five yards from the point of beginning the play may not attempt to jump over a player who is still on his feet. Stepping over a prostrate player is not hurdling. In the open, a player on his knee may be hurdled without penalty.

Kick-off. The play by which first and third halves are opened. A place kick from the forty yard line of the team possessing the ball.

Offside. A player is offside when the ball has last been touched by a member of his own team behind him. No offside man may touch the ball, except to recover a muff or a fumble or to recover a forward pass under the rules. All players of Team A are onside when the ball has last been touched by a member of Team B.

Out of Bounds. The ball is out of bounds when either the ball or the player carrying it touches the ground on or outside the side line or side line extended. If a ball kicked by a member of Team A goes out of bounds without touching a member of Team B, the ball goes to Team B; but if such a ball touches a member of Team B before going out it belongs to the team which first secures possession of it. A ball out of bounds must be brought back into the field five or fifteen yards, for scrimmage. No player may be out of bounds when the ball is put in play except the kicker and the holder of the ball in a place kick.

Penalties. Loss of five yards. For taking out time more than three times during either half, unless the player is removed for whose benefit time was taken out. For failure of a substitute to report to referee before entering play; for illegal position or offside play; for violating neutral zone at scrimmage; for playing out of bounds; for putting ball in play illegally; for guard or center carrying ball; for feint to snap the ball; for fake attempts to draw opponents offside; for player

taking more than two steps after fair catch; for delaying the game; for interfering with opponents before ball is in play; for holding by defense; for wilful collision with the full back; for crawling after the ball is down; for flying tackle or tackle below the knees; for unfair play not specifically mentioned in the rules.

Loss of fifteen yards. For intentional throwing of forward pass to the ground; for substitute communicating with a player before the ball is put in play; for any player leaving the field during the one-minute intermissions; for interfering with a signaled fair catch; for tackling a player who has made a fair catch; for unlawful assistance to a man carrying the ball, including interlocked interference; for holding, by side possessing the ball; for forward pass by the team which did not put the ball in play; for roughing a man who has kicked the ball; for hurdling; for piling up after the referee declares the ball dead; for any unnecessary roughness or unsportsmanlike action; for coaching from the side lines; for illegal presence on the field of play.

Loss of twenty-five yards. For being unready to play at the beginning of the second half.

Loss of half the distance to the goal. For a player illegally returning to the game; for striking, kneeing or kicking an opponent; for a foul by the defense within one yard of its goal line.

Loss of a down. For the first incomplete forward pass before first down on any series of plays; for more than one forward pass in a scrimmage; for two players of the passing side touching a forward pass; for forward pass going out of bounds on the fly; for ball snapped out of bounds by Team A and recovered by Team A.

Loss of ball to opponents. For the four cases last mentioned, if on fourth down; for an offside player touching the ball; for a kicker recovering the ball before it has been touched by a man entitled to get it; for kicking or kicking at a loose ball.

Suspension from game. For illegal return to the game; for illegal equipment.

Disqualification. For striking, kneeing, kicking; for roughing the kicker; for any flagrantly unsportsmanlike conduct.

Forfeiture of the game. For refusal to allow the game to proceed, or refusal to play within two minutes, when ordered by the referee.

Place kick. A ball kicked while it is resting on the ground, either free, as at kick-off, or supported by an assisting player.

Punt. A kick in which the ball is struck as it drops from the player's hands, and before it touches the ground.

Safety. A safety is made when the ball is declared dead, behind or on the goal line, in the hands of a player defending his own goal, provided that the impetus which sent the ball over the goal line was given by a member of the defending team. Certain other technical cases of fouls, incomplete passes, or kicks across the side lines also constitute safeties. A safety made by a plater of Team A counts two points for Team B.

Scrimmage. The action of putting the ball in play between closely opposing lines of players. At least seven men of each team must be in position on the scrimmage when the ball is put in play. There are really two scrimmage lines, separated by the length of the ball as it lies lengthwise on the field. To be in position on the scrimmage line a player must have two hands or two feet, or one hand and the opposite foot, within twelve inches of his team's line.

The seven men in the line-up for scrimmage are, each way from the middle, center, right and left guards, right and left tackles, right and left ends. Back of the line, one yard or more, are the quarter back, the right and left half backs, and the full back. The ball is put in play by being snapped back on signal from center to quarter back.

Touchback. Resembles safety. Occurs, for example, when Team A has sent the ball over B's goal line, but a member of B touches it down behind the line. After a touchback or a safety, the defenders who made the touchback or the safety put the ball in play on their own twenty yard line.

Touchdown. Made when a ball lawfully held by a member of either team is declared down, on, over or behind the opponents' goal line.

GOLF

Golf is a game which is known to have existed in very ancient times among the people of Holland and Belgium. In these countries, however, it was played, for the most part, on ice. Interest in the game spread to Scotland, and today most people believe that it is of Scotch origin because of the immense popularity which it attained there. In the history of games and sports we read that, as early as 1457, the local Scottish Parliament felt justified in declaiming against the abuse which the game was suffering. In 1592 the Edinburg town council forbade the playing of golf on the Sabbath day, and anyone who was found guilty of disobeying the order was severly punished. After James I ascended the throne in 1603, the game was introduced into England, but it was not until two centuries later that it was accepted with favor there. About the middle of the nineteenth century the people of Canada, India and the United States took an interest in golf, and in 1894 the United States Golf Association was organized with four clubs. The rapid spread of interest in this very health-giving and intriguing game is indicated by the fact that, in 1930, the Association had more than two hundred clubs affiliated with it, and that numerous subordinate leagues, associations and independent clubs had also been organized.

Golf is played on fields, or links, over courses of either nine or eighteen holes. A standard golf course consists of eighteen holes, at distances varying from a hundred yards to half a mile apart. Holes are four and one-half inches in diameter, and not less than four inches deep. They are located at approximately the center of carefully tended spots, called greens. If possible, courses are laid out so that the first and last holes are near each other. A flag, usually red in color, supported by an upright iron rod which rests in the hole except when temporarily removed by a player, indicates the location of each hole.

The clubs used in golf may well enough be classified in four general groups: drivers, for teeing off and long shots; driving irons, for intermediate shots; putters, for sinking the ball in the cup; clubs of special design or material, used in meeting emergencies. To the last group belong, for example, the niblick, cleek, brassie and lofting mashie. Inasmuch as a ball may not be touched by the hands from the time it is teed for the first shot until it drops into the four-inch hole, there are bound to be times when clubs useful in smooth, level going are of no service whatever in crises. If a ball has dropped into a rut or a heel-print, a niblick will get it out; if it is necessary to make a short, lifting shot in order to clear a hazard or reach a higher level, a lofting mashie will do the work.

Most people who make a beginning at golf become enthusiasts, whether they master the game or not. There are a good many reasons for this: Always there is a long walk in the open, in attractive country, on velvety turf. Always one matches his wits and skill against a combination hard to beat, so that every good stroke is a personal triumph and every bad shot is a challenge to do better next time. The conditions are so varied that two perfect shots can seldom be exactly alike. Distances vary, surfaces vary, there are traps, hazards, bunkers and obstacles; slopes up, down, right, left. At one time it may be desirable to make all possible distance—150 or 200 yards in the clear, with a long run of the ball after it strikes; again only a medium distance is to be covered, but the ball must perhaps rise high in the air to get over an obstacle, and stop almost without run, to avoid a trap or stay on the green. Even these shots are not the most difficult ones, for more games are lost on the putting green than anywhere else. It is the dainty little shots of a few inches or a few feet that make the severest test of judgment and control. Here a fraction of an inch to the right or left, a shade too much or too little force, leaves the ball high and dry, with a stroke as surely lost as though a long drive had failed. To accomplish just the result desired, the right club must be chosen, the stroke must be timed and directed, and the power controlled for the effects wanted.

Usually one has a live opponent and a very real contest, but it is possible to have a very good round of golf with only "Colonel Bogie" in sight. Colonel Bogie is that imaginary player on every course who never makes a hopelessly bad mistake; always manages to get from one hole to the next in a proper number of strokes, and leaves a record of his performance at each hole for other folks to measure themselves against.

Many players prefer to be attended by a caddie (usually a young boy) who carries the bag containing the clubs. Players start from the teeing ground, where one of them commences the match by placing his golf ball on the tee—a small heap of sand or an artificial rubber or wooden cone. The purpose of the tee-off is to drive the ball as near as possible to the first hole. The second player does the same with his ball, after which he whose ball is farthest from the hole plays again. This is continued until both players have holed their balls. The hole is won by whichever player has taken the fewest number of strokes. At each succeeding hole that player tees off

first who has won the last hole; it is said to be his "honor."

The game is called singles when played between two persons, and foursomes when two people (playing partners) compete against two others. In match play, two players go over the course together, each claiming for his own score the holes which he has made in a smaller number of strokes than his opponent. If both have taken the same number of strokes the hole is halved, and neither counts. In medal play only the total number of strokes used by each player in the entire round is counted in the final decision. A full contest of either sort plays seventy-two holes. In championship play the winner commonly makes an average of about four and one-sixth shots for each of the seventy-two holes.

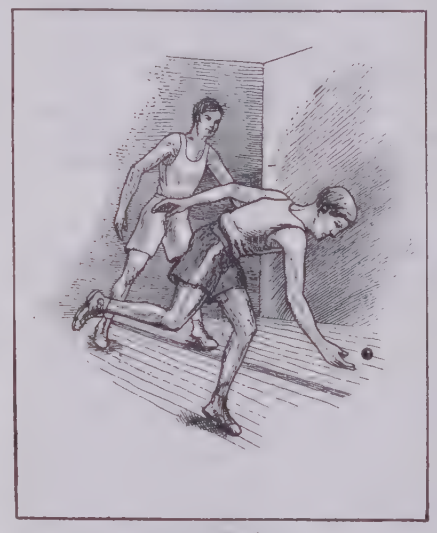
Probably no game has ever been invented which has taken a stronger hold on its devotees than has golf. It is consequently to be hoped that there will be a continued extension of public courses so that those who cannot afford membership in a club will not be deprived of this pleasurable, out-of-door sport.

HANDBALL

Handball is a national game of Ireland, where it appears to have originated. It is played in England, under the name of "fives," with rules rather more elaborate than the Irish rules. Handball in the United States is of simpler form.

Handball strongly resembles squash, the chief differences being that in squash the ball is struck by a racket, the court is smaller, and five playing surfaces are necessary, rather than optional.

A handball floor is sixty feet by twenty-four and one-half feet. The front wall is thirty-five feet high. Other walls may slope down toward the back, which is considerably lower than the front. A line, called the ace line, is drawn on the floor parallel to the front wall and thirty feet from it. Two feet nearer the front wall is a second line, marking the limit beyond which the server must not take more than one step in the act of serving.



The game is played by two or four persons. The object is to secure points, by causing the opponent to fail in returning a ball to the front wall. In this country twenty-one points make game.

The ball may be hit by either hand. The hand is best held as a shallow cup, deepest at the second joint, where the ball strikes. Gloves may be worn.

Each effort to win a point begins by a service. For this play a ball is dropped to the floor and hit as it rebounds. A ball served must go to the front wall without striking any other object, must hit the wall above the six-inch baseboard, and in rebounding must first touch the floor beyond the ace line—though it may cleverly be made to strike side and back walls on its way to the floor. A served ball which strikes between the front wall and the ace line in its rebound from the front is a short ball. Three shorts in succession cause loss of service—the hand-in becomes hand-out. Each fair service cancels whatever shorts the server may have against him.

If a served ball strikes properly behind the ace line the receiver must return it on first bound, to the front wall above the baseboard. After this first service and return the players alternate in striking the ball until one fails to get it back to the front. Only the served ball must strike behind the ace line in rebounding from the front wall; all returned balls may fall on either side of the ace line. Again, it is only the served ball which must be returned on first bound; in all other cases balls coming from the front may either be volleyed before they strike the floor or hit on first bound.

In general, intentional interference, blocking the ball, is a foul; unintentional interference is only a hinder. Fouls are punished, but a hinder is merely followed by reservice from the same player. It is always a foul, however, to stop a ball on its way to the front wall.

Handball
This game is played by two or four persons. Gloves may be worn if desired.

It is a foul to strike a ball with both hands or to touch the ball twice in one attempt at batting.

Since only the server can score, fouls by the hand-in forfeit the ball, while fouls by the hand-out score for the server.

The officials of handball are a referee and a scorer.

HOCKEY

Hockey is played with a ball or some similar object by two opposing sides, each player using a hooked or bent stick with which he attempts to drive the ball into the opponent's goal. It is thought quite probable that the name "hockey" was derived from the "hooked" stick employed.

Hockey is a game of ancient origin. The Romans played a game very similar in nature, and one or more variations of it were known to most northern peoples of Asia and Europe. In Ireland it was called "shinty," and in Scotland, "hurley."

Modern hockey owes its recent popularity to the formation of "The Men's Hockey Association" in England in 1875. Since 1890 inter-university matches between Oxford and Cambridge have been held annually, and since 1895 yearly international matches have been held between England, Ireland, Scotland and Wales.

There are two major divisions of this sport—field hockey and ice hockey, both of which are here explained:

Field Hockey. *The playing field.* Field, 90 or 100 yds. by 50 or 60 yds. Five-yard strips along each side. Goal posts, 12 ft. apart at middle of each end. Cross bar, 7 ft. up. Net back of goal to catch ball. Striking circle. Front of this circle is a 12 ft. line parallel to goal line 15 yds. forward from goal posts. Ends of this forward line are connected with goal line by arcs from goal posts as centers. Boundary lines are called "side lines" and "goal lines," respectively. One "mid line" and two "quarter lines."

Team. 11 men—5 forwards, 3 half backs, 2 full backs, 1 goal-keeper, with general positions as shown in the diagram.

Object of the game. To drive a ball through the opponents' goal, by striking it with hockey sticks. All shots at goal must be made from within the striking circle.

The forwards are the chief attackers; the half backs assist the forwards; full backs break up attacks by the enemy; goal keepers block shots at goal. Every attacking man is guarded by a corresponding opponent.

Only players "onside" may strike a ball toward the opponents' goal. A player is "offside" when the ball has last been hit or rolled in by a member of his own team behind him, unless at the time player is in his own half of the field or unless there are three or more opponents between the player and the goal he is attacking. An offside player becomes onside when his teammate who last touched the ball passes him toward the opponents' goal, or when an opponent touches the ball.

It is permitted to stop the ball by using any part of the body, but only the goal-keeper may kick the ball. A ball caught in the hands must be dropped at once to fall perpendicularly.

Back strokes are not permitted. A player may not hook an opponents' stick to stop a blow, or hook an opponents' clothing or person.

The beginning of a hockey game is an operation known as the "bully." For this, two opposing players stand on the center line, each with the opponents' goal at his left hand and with the ball between them. Each must strike the ground and the opponents' stick three times in succession, after which both are free to strike the ball. During this operation all players of each side must be behind the ball.

A bully on the mid-line is also used at the beginning of the second half and after each scoring of a goal. If an attacker drives the ball across the opponents' goal line outside the posts a bully must be played on the twenty-five yard line nearer this goal. An intentional foul by the defenders within the striking circle calls for a penalty corner.

When any player causes the ball to go out of bounds at the side one of his opponents must put the ball back in play by rolling it into the field in any direction. For this purpose only one man may be outside the five yard line.

It is a foul (1) to hold, strike, push, trip

or kick an opponent; (2) to raise the stick above the shoulders; (3) to strike with the back of the stick; (4) to strike the ball while offside; (5) to cross between a player and the ball, in order to prevent his striking.

Penalty for each of these fouls, one free hit by the opponents, the defenders standing at least five yards from the man who makes the free hit.

Game, two halves of twenty-five, twenty, or fifteen minutes each, or shorter halves by agreement.

Score, one point for each goal.

The referee is head official, and has charge of the ball.

An umpire in each half of the field watches the conduct of players, and reports certain classes of fouls assigned to him.

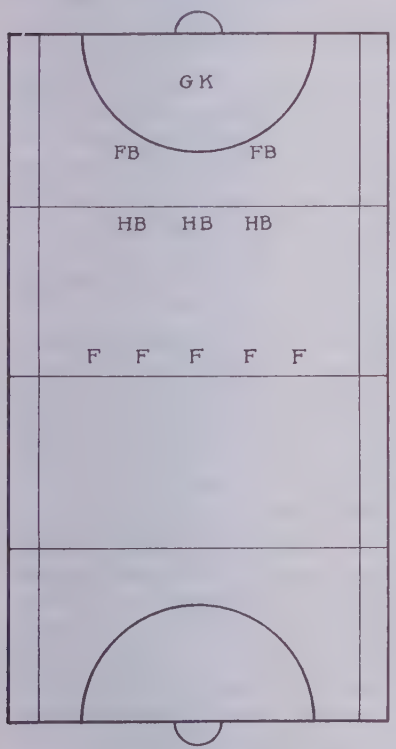


Diagram of Hockey Field
GK, Goal-keeper; FB, Full back; HB, Half back, F, Forward.

Ice Hockey. This game, originally called "bandy," is exceedingly more popular in countries where there is ice than is field hockey. In fact, in America, "hockey" means "ice hockey." In its simplest form of driving a ball across a given limit with a stick, ice hockey has been known for at least five centuries in northern Europe. So popular was it in the Low Countries that many sixteenth and seventeenth century paintings depict games of "bandy."

On the North American continent, the development of the modern game is due to the efforts of the Victoria Hockey Club and McGill University (Montreal). In 1881 the secretary of the Victoria club drew up a recognized code of rules which governed important matches. The first general tournament in Canada took place in 1884. It was not long before the exhibitions given by the big teams of the Ottawa, Quebec, Crystal and Montreal Hockey Clubs excited the interest of people in the larger cities throughout the United States. As a consequence, the game was eagerly accepted by athletic clubs, secondary schools and colleges, and became nearly as popular in the northern states as in Canada. There are now a number of hockey organizations in the United States, all under the jurisdiction of the American Hockey League. Interest in the game is spreading, and even now we can safely say that it can be considered as a major sport of the winter season.

Ice hockey resembles field hockey in essential details, the chief differences being that in ice hockey a team consists of seven players instead of eleven; caroms from side banks are important; a rubber disk called "puck" is used instead of a ball; and the goal is smaller. The posts for ice hockey are six feet apart, and the crossbar is four feet high. The playing rules are approximately the same in the two games.

HORSESHOES

The game of "pitching horseshoes" is a common and popular sport throughout America. Two iron pegs one inch in diameter are driven down forty feet apart, inclining one inch toward each other, with eight inches projecting above the ground. The pegs are in the center of the pitcher's box which is six feet square. A contestant may stand anywhere in the box. Each player has two shoes of the same weight and size. The players take turns in pitching. Shoes which encircle the peg when the count is taken are "ringers," and count three (leaners count merely as the closest shoe). One count goes to each shoe which lies nearer to the peg than any shoe of an opponent. If two or more shoes are equal distances from the peg or are all ringers, it is a tie and no points are given. Game consists of twenty-one points.

INDOOR BASEBALL OR PLAYGROUND BASEBALL

The floor space for indoor baseball should be at least forty feet by fifty feet. The standard size for a diamond in a gymnasium is 27 feet square. Where more space is available, the square is often thirty-five feet. The front of the pitcher's box is twenty-three feet from home plate—less than half the distance required for out-of-door baseball. The home plate is twelve by twelve inches and all others are eighteen inches square. Teams may consist of either seven or nine players.

The object of the game is to make runs—passages round the diamond, touching all four bases. Runners are liable to be put out in various ways, much as in outdoor baseball. Nine innings make a game.

The smallness of the field makes certain changes of baseball rules necessary:

The ball is larger than an out-of-door ball and much softer. The bat is shorter and smaller around than for the regular game out of doors. Pitchers may throw to the batter only underhand. A batted ball is fair or foul according as it first strikes, not as it rolls or bounds after striking. Stealing is minimized by the rule that base runners may not leave their bases while the pitcher holds the ball. Base runners may overrun at second and third as well as at first, provided that they take the sack with them as they go by and bring it back. The positions of all players but the pitcher are considerably varied, as need arises and the captain directs. Since hits are necessarily short, several fielders are likely to be found in positions which would belong to a shortstop out of doors.

In other respects, indoor baseball is about like the out-of-door game.

LACROSSE

Lacrosse, the national game of Canada, is of Indian origin. The British are mildly interested in lacrosse, the Americans hardly more than curious about it. But the game admits of wonderful skill. In general, it resembles hockey; the field is of about the same size; the object of the game is to pass a ball through a goal at the end of the field; goal posts are six feet high, with a crossbar six feet from the ground; nets are commonly placed behind the goals to stop the ball. But the differences are also notable:

The boundaries of the lacrosse field are agreed upon by the captains. The striking circle of hockey is replaced by a twelve-foot square, with the goal in its center. Twelve men constitute a team. The hockey stick is displaced by the "crosse," a shallow, racket-pouch with a handle of any convenient length, loosely strung in such a way that the ball can be retained in the pouch only by a skillful rocking of the crosse. Offside play is not recognized, and so of course not penalized. Rubber soles are permitted, but spikes are forbidden. The ball is of spongy rubber, weight, four and one-quarter ounces.

The play begins with "facing"—a maneuver corresponding to the "bully" of hockey and the center-jump of basketball. Two players face each other, left hands toward the goal they are to attack. On signal, each draws his crosse sharply toward him and is then free to try for the ball. He may bat the ball if he chooses, or scoop it up and run with it, but the best of tactics is to begin as promptly as possible a series of short quick passes toward the goal. The Canadians have developed amazing team play, with pass work more remarkable than that of the best basketball player, in view of the tools by which the passing must be done. It is possible to throw the ball 200 yards or more with the crosse, but short throws retaining control of the ball pay better in the long run.

Charging is not permitted, but a man may block the progress of a player who is advancing with the ball, by standing in his way. When the ball goes out of bounds the two nearest players must "face," not less than four yards from the boundary line.

It is a foul to strike, push, hold or trip an opponent; to throw the crosse; to interfere with a player who has not the ball; to interfere with the goal-keeper before the ball passes into the crease; to touch the ball with the hand. (A goal-keeper may stop the ball with his hands, as in hockey. The crease is the twelve-foot square surrounding the goal.) The score is one point for each goal.

The penalty for a foul is either disqualification, or a "free position." If the latter, the referee designates a player of the side against whom the foul was committed to make such play with the ball as he may choose, no opponent being permitted within five yards when his play is made. A free

position cannot be declared within ten yards of the goal which would be endangered by it.

MINOR GYMNASIUM AND PLAYGROUND GAMES

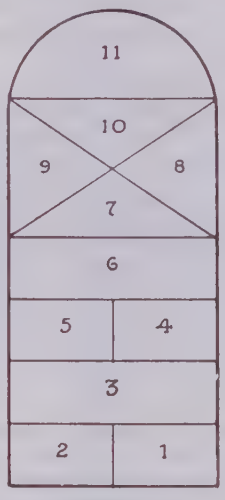
The games which are used in the gymnasium or on the playground vary according to the differences in skill and technique required for playing them. There are games which are very simple and have but few rules. Others are more complicated and require considerable instruction and practice in order to play them well and to get the full enjoyment from them. They are usually thought of as games of "high organization" and games of "low organization." Games of low organization are intended primarily for younger children or to build up the interest in an activity period leading to a game requiring higher organization. More commonly these games are classified into "major" and "minor" games. They are listed here, major games or those of higher organization separately, and minor games or those of lower organization in this group. It is sometimes difficult to classify games properly but the division here given will meet most of the conditions for gymnasium and playground use.

Bar Pull. Two players sit on the floor facing each other, legs extended, soles of feet touching and hands grasping a wand held crosswise between them. On signal, each attempts to pull the other to his feet.

Bombardment. A line is drawn across the middle of the field and two teams line up on opposite sides, a dozen feet or more from the line. Each party has several basket balls or medicine balls for ammunition, and each player has an Indian club standing beside him, which it is his business to guard. If a pin is knocked down either by an opponent or by the guard it counts for the opposition and must be set up before the guard can make another shot.

Bull in the Pen. Players join hands in a ring, facing in. One of the number is chosen "bull," and attempts to break out by charging through between two players. If he succeeds, he may take the place of either of the two who let him through, and the player so displaced becomes bull.

Cat and Mouse. Circle of players facing in, hands joined. A player chosen to be "cat" attempts to catch a player mouse, beginning with the mouse inside the circle, the cat outside. The players in the circle let the mouse through by raising their arms, but lock the cat. Two slow cats and one quick mouse make a good variation.



Chicken Fight. Two players stand in an eight-foot circle, each on one foot, with arms folded, or with one arm folded and the other clasping the unused foot. The players hop about the circle and try to bump each other into losing the fight. If either touches his second foot to the ground, or steps across the circle, or falls, or unfolds his arms, he is defeated.

Circle Ball. A circle of players several feet apart, with one player inside the ring. Players in the circle throw to each other a medicine ball or basket ball, and the player within tries to intercept it. If a catcher drops the ball he is "it," and if the player in the center blocks the ball or catches it, the thrower becomes "it."

Crowd Ball. A large ball twenty inches in diameter is tossed up between two lines of players near the center of the field, whereupon each party attempts to rush the ball down field to the opponents' goal line. Batting and throwing the ball are permitted. Goals count one point.

Curtain Ball. A curtain ten feet high is stretched across the middle of the playing space, with half the company on each side. Each party throws the ball over the curtain, and balls which touch the floor count for the throwers.

Dodge Ball. Half the players stand in a large circle, the other half inside the circle. Those in the circle try to hit players inside the circle with a basket ball. Players so hit drop out. When the last one is hit the sides exchange places.

Hopscotch
This is one of the oldest diagrams. Numbers 1, 2, 4 and 5 are "bedrooms"; 3 and 6 are "pickups"; 7, 8, 9 and 10 are "pie"; 11 is the "moon."

Duck on the Rock. A straight line is drawn on the ground, about twenty-five feet from a substantial rock. The player who is "it" stands near this rock, guarding his "duck," which sits on the rock. Other players begin the game by throwing their rocks, one by one, at the duck. If the duck is knocked off the rock, players who have thrown may recover their missiles and go safely back to the throwing line, so long as the duck is off. The tender hurries to put his duck back on the rock, for while the duck is on, the guard may tag anybody who so much as touches a missile in the attempt to recover it, and a person so caught becomes "it," placing his own missile as duck.

Fox and Geese or Fox Trail. Played on the spokes and rim of a large wheel tramped in the snow. The fox or the hunter—his name depends on the title of the game—stands near the hub of the wheel and attempts to catch any players who try to cross from side to side. Neither fox nor geese may leave the beaten paths. Geese are safe in the "dens," where spokes meet the rims of the wheel. The game is livelier when two circles are drawn, with dens on the outer rim and runways along the spokes and the inner rim. Any player caught becomes "it."

Hand Wrestling. Two standing players face each other and grasp right hands. Using this contact only, each player tries to make the other move one foot.

Hopscotch. Hopscotch is played in several forms, all alike in that an object is thrown into and brought back from successive areas in a diagram. The best place for the game is on bare ground or on goodsized squares of cement.

A player standing on the base-line tosses the hopscotch block into "bedroom" No. 1, lifts one foot, hops in, works the block around until he can kick it out at the base line, and hops out after it. Then he does the second bedroom in the same way, but must hop through Number 1 on the way in and out. Numbers 3 and 6, the "pick-ups," are like 1 and 2 except that the block is picked up and carried in the hand as the player hops back through the preceding spaces. Numbers 4 and 5 are like 1 and 2, and so are the "pies," 7, 8, 9 and 10. The "moon," (11) is the high climax in this game. The block is thrown in as before, worked toward the curved end of the moon and kicked out backward. Then the player hops out after it, picks it up, places it under his knee, and holds it in the angle of the raised leg while he hops back through all the spaces in reverse order. The player who first achieves all this wins. An error of any sort ends the player's turn, and he must begin at his next turn in the square for which he last threw the block.

A player must hop through each square in 1, 2, 3 order to the one where he is due, and must come back in reverse order. He must not step on a line. The block must not stop on a line nor be dropped except into the square where due. There must be no handling of the block in coming back from the moon.

Human Target. One player is chosen for target. All others, moving about and passing the ball, attempt to hit the target. Throwers cannot run with the ball in their possession. When the player is hit, a new target is chosen.

Indian Club Race. Forty or fifty feet from the starting line is a second line, along which are standing four Indian clubs for each contestant. The runner who brings one at a time and sets up all his clubs wins the race. The clubs may be arranged in various ways or the race may be a relay.

Indian Wrestle. Two players lie on the mat with feet in opposite directions, the right arms locked together. On count "One" they raise the right legs and touch toes. Same for count "Two." On count "Three" they raise and lock legs at knees and in that position attempt to roll each other over backwards. Vary with left arms and legs.

"I Spy." Any number of players from three to thirty. The player who is "it" stands at goal blindfolded, counting one hundred while all other players hide. At the last count he calls out "One hundred" or some other warning and starts out to find the hidden players. A familiar warning call is:

"One, two, three! Look out for me!
For I am coming, and I can see!"

As soon as a player knows that he has been seen he should race to the goal, for the first to count three there wins. If the spy comes first, he says "One, two, three for Billy Jones," (mentioning player's name,) and Billy, as first caught must stand for the next

game. Any players who reach the goal and there count "One, two, three for me!" before the spy can do so for them, are free.

Keep the Ball. Three or more players; if more than three, divide them into teams. Each team attempts to pass the ball by throwing to a teammate, while the other side attempts to block passes and capture the ball. A game may be won by counting passes to any agreed number.

Kicking Baseball. Home plate four feet wide, two feet deep. The batsman stands on the home plate and kicks at a pitched basket ball. Strikes are called for pitched balls which pass over the plate below the knee, for attempts to kick, and for the first two fouls. Bases are thirty or forty feet apart. Players are put out as in baseball, and also by the catching of the third strike on first bound or by being hit by a ball while running bases.

Line Football. Opposing teams line up behind goal lines at ends of gymnasium or playground. A basket ball lies in the center. At signal, the right end man of each line runs for the ball, attempting to kick a goal. Kickers must not use the hands, but guards may bat or kick the ball, provided they have only one foot across the line. Kickers take their places at the left end of the line. Goals count one point.

Old Sow. If there are five players, four shallow holes are dug at the four corners of a square about fifteen feet on a side, and a similar hole is dug in the middle. Each player has a hockey stick or other crooked club, with which he strikes the block. The player who is "it" tries to bring the block into the center hole, and the others try to prevent by batting it away. A hole may be stolen whenever a player is not holding it with his stick, and the player who is "it" may capture a hole by putting his stick in it while the owner's stick is out, in which case the dispossessed one must either find another hole or become "it." If the middle man succeeds in dropping the block into the center hole he may choose his successor.

One Hole Cat or One Old Cat. Three or four players, who rotate through the positions of fielder, pitcher, catcher and batter. One base is so located that the batter can run to it and back after a good hit. The batter continues to bat until he is put out. Then the catcher takes his place, everybody moves up one notch, and the ousted batter begins again as pitcher or fielder.

Pirates. The most violent of team contests. Two well-separated lines mark the two home grounds. Each player attempts by sheer strength to capture and drag home enemy players.

Plug Ball. Two lines about twenty feet apart, with same number of players, preferably a big group behind each line. Basket balls and medicine balls are thrown back and forth. A ball touching the floor before it reaches the team line counts against the thrower; balls touching the floor behind the line count against the receivers. A referee keeps score for each goal line. There should be one ball for six or eight players.

Prisoner's Base. A very old game. Two parallel base lines are drawn fifty or sixty feet apart, with a three-foot circle—the prison—just behind the middle of each line. The object of each party is to take and keep prisoners from the enemy and to set free its own members who have been captured. A player who left his home base after an opponent set out may capture that opponent and take him to prison in the three-foot circle, provided that a still later opponent does not appear and take captive the captor. Any player who returns to home base may immediately set out as the all-conquering hero, until a still fresher arrival sends him scurrying back for a new right of way. If a player successfully penetrates to his enemy's prison, he may release the prisoners and bring them home unhindered to continue the game. The game ends either by the exhaustion of the enemy's forces or by a count of heads when time is up.

Pull-Away. Two parallel lines at any convenient distance apart. The player who is "it" attempts to tag on the back the players who run across from side to side. If they do not cross, he warns—"Pom-pom—pull-away! Come away or I'll fetch you away!" Whereupon he counts ten, and on the tenth count, all must run across, on penalty of being tagged where they stand. Players caught join in catching others, until none remains. The first one caught is "it" for the next game.

Rope Tug of War. A long rope is provided, on which two opposing teams pull, endeavoring to draw the marked middle of the rope beyond a certain distance marker. In the more exciting forms of this sport, a ditch or stream lies between the contending parties and the losers pay the penalty of a ducking.

Scrimmage Ball. Two goal lines are drawn near opposite ends of the playing space. Each team lines up behind its own goal, with the ball lying on the floor at center. One half of each team are forwards, the other half guards. The forwards and guards exchange places after each goal. On the referee's signal, the forwards rush out and try to put the ball across the opponent's goal line, by pushing or batting it with one hand. Guards defending their goal may step across the line with one foot, but not with both. Fouls are declared for rough play, for blocking or propelling the ball except with one hand, for throwing the ball, or for the propelling of the ball by a player who is down. Penalty for fouls, a try at goal from the foul line, with defenders behind their goal line, and attackers on the foul line. The ball is tossed up by one of the forwards, and batted by another forward. If the defenders block the ball, it is still in play. A goal from the field counts two points; a goal from the foul line, one point.

Scrub. Scrub grows out of the game of one old cat by the addition of another base or two, a few fielders, and perhaps a waiting list of batters, everybody moving up in turn as a batter is put out.

Sparrow Fight. Two players sit on the floor near each other, each with a wand held in the bend of the elbows and passing under the knees, the hands clasped over the shins. Each player attempts to upset the other by getting a toe under the opponent's foot, and lifting.

Swat Ball. Two equal teams divide between them all available air-filled balls, and attempt to hit opponents with them. A player who is hit must drop out of the game. Balls may be recovered by anyone who can get them and used over and over. There are no space restrictions. The game ends by a count of teams after a given time or by the annihilation of either party.

Three Deep. Players in a circle, two deep, in pairs, one player behind another. A runner and a chaser are chosen. To avoid being caught, the runner may stop in front of any pair, making it "three deep." The outside or rear player is thus crowded off, and becomes the runner, in danger of being caught, until he saves himself. If the player who is "it" catches the runner, the runner becomes chaser, and the former chaser must save himself by stopping somewhere three deep.

Tug of War or Catch and Pull. A line is drawn on the floor or the ground. Players divide into two teams on opposite sides of this line. The game is to pull opponents across the line, catch as catch can. Several players may grapple one man if they can manage it, but any player who wholly crosses the scratch line becomes a member of the opponents' team and must work there.

Two Old Cat. Four or more players. Two bases, with a batter at each, and a catcher behind the bat. Each catcher becomes a pitcher for the return throw, so that the batters strike alternately. When either makes a hit both batters must run, exchanging bases, and either or both may be put out by getting the ball to the base before the runner reaches it. When a put out occurs at either base, the catcher at that base takes the bat, and his fielder, if any, becomes catcher.

POLO

Polo is the oldest and most widespread member of the hockey family, for, judging by the records and literary references, foot hockey has always been derived from the mounted sort. Authentic polo is more than 2000 years old.

Polo has naturally used a great variety of rules, implements, team numbers and styles of play. The English system of closely planned team-work and short passes down the field was defeated by an American team in 1909. British comment reported that when the Americans came to England, they were inferior in both mounts and pass work, but that they bought the ponies and learned the combinations, without sacrificing individual dash and long-range marksmanship.

Polo grounds are commonly about 175 by 300 yards in size, with broad margins. Two to eight players—usually four—make a team. The object of the game is to drive a wooden ball, from horseback, by strokes of a long-handled mallet, between goal posts eight yards apart.

Ponies for this game are especially bred and trained. They must be exactly fourteen hands and two inches high, "with the strength of a hunter, the courage of a racer, and the docility of a pony." The tendency to extravagant expense in the game has to be met by rules and close supervision.

The requirements of this game are severe, There must be perfect horsemanship, good.

quick, clear and cool headwork, and the ability to make controlled shots, forward or backhand, meeting a flying ball with a mallet head.

The conditions of this game make it less democratic than golf, but its magnificent challenge to daring and skill, and its value in training for open warfare have kept its hold on vigorous young men of means, and its place in regular armies.

Play is in periods of seven and one-half minutes each, the number of periods depending on the number of players. When four men play, there are eight periods, with short intermissions between.

The game begins by a "throw-in." On signal, the referee throws the ball between two opposing lines of three players each, facing opposite goals, with one man on guard behind each line. Instantly after the throw-in, the dash and struggle are on. The ball may be struck only with the mallet, must not be caught or held, though it may be blocked by the players person or by his pony. Dribbling with the mallet is permitted.

If a ball goes over the side lines, it is thrown in as in the beginning, but opposite the point where it went out. If the attackers drive the ball across their opponents' end line outside the goal posts, a defender shall knock the ball into the field, from a point along the end line at least ten feet outside the post. At the instant he strikes the ball no opponent may be within fifty feet of him. If the player delays in making his stroke the referee may put the ball in play by throwing it in.

Safety of players and ponies is furthered by certain rules. The player who last hit the ball has the right of way in following it for another shot. No opponent may block his right of way by stopping crosswise of his course between him and the ball, nor may there be any crossing of his path except at safe distances. But a man may cut into or across the right of way if the conditions make it safe to do so. The referee is, of course, the judge of safe play.

Hooking an opponent's mallet is forbidden, except to block an actual stroke, and then there must be no reaching across the opponent's pony. Two players approaching a ball from opposite directions must have the ball between them, at each man's right hand. Charging or striking a player or a pony with the mallet are forbidden. Fouls are declared for any of these offenses, and in general for all cases of careless, reckless, dangerous riding, for roughness in personal contact with an opponent, or for cruel treatment of ponies. It is a foul for a dismounted player to strike the ball or for any assistance to be given in the progress of the game by a person who comes on the field for that purpose.

Each foul subtracts one-quarter or one-half point from the score of the offending team. A goal made, directly or indirectly, by means of foul play does not count.

QUOITS

The formal game of quoits is seldom met with in America. It is played with flattened ring-shaped pieces of iron, called "quoits," and the rules are similar to those for the game of horseshoes (which see).

RIFLERY

Hints for Beginners. Clean and oil your gun every day you use it, every day in camp, and once a month on general principles. You can inspect the inside of a rifle barrel by putting a piece of paper in the breech for a reflector. Don't stop cleaning until the rags come through without any discoloring, and the barrel shines in every spot. A solvent oil is best for taking out the residue of powder. Be especially careful to clean the cartridge chamber in the barrel. The powder residue eats away the steel; the shells expand on firing, and then the extractor will not work.

Be careful not to jam your sights. A slight blow may spoil your marksmanship and bring famine in camp. If you give peep sights a three days' trial, you will probably not use other types afterward. For snap shooting get the largest aperture you can buy.

Practical rifle fire is both quick and accurate. In all contests, and in your daily practice, work against both time and the bull's eye. Invent a scoring system in which time counts perhaps two points, to three for accuracy. To gain speed, learn to shoot on the lift and on the swing from right and left. It is bad policy to try to freeze the sights in a long, hesitating refinement. Make your gun barrel draw a line which brings the tip of the front bead just below the spot you want to hit. Slow down the motion as the bead comes to place and squeeze the trigger. Never consciously pull on a trigger with the finger. Squeeze with the whole hand as though the gun stock were a lemon.

If your shots tend to group at one side, study the situation. If you are an amateur and the shots are at the right, you are probably flinching a bit, pulling your trigger and drawing the muzzle around with it. Try lying prone, shooting over a padded rest of some sort—a lump of sod, a folded coat, anything to support the barrel without solid reaction from below. Very slowly squeeze the trigger.

Learn to "call your shots," that is, notice exactly where the bead lies on the target when the bullet starts. That point is by no means sure to be where it was when you fired.

If your gun comes with a heavy trigger pull and is not automatic it is well to have the trigger pull reduced to four pounds.

After several hours of careful practice on different days, if your shots continue to go wrong in consistent groups, you should have an expert try your sights. Sight your own rifles as soon as you know you can trust your aim and your trigger pull from the prone position. Remember that the forward sight works by contraries—if you move it to the left, you have thrown your shots to the right, and so on. The final horizontal corrections of a peep sight are made with bits of paper under one edge of the sight base.

Some sort of rivalry gives the best impulse to speed, but the highest premium must always be on accuracy. When you can score ten bull's-eyes in ten seconds, at a two inch ring fifty yards away, you are becoming a fair shot at a standing mark. Refinement of the stationary game comes with the use of smaller targets, farther away, with allowance for sunlight, windage and distance.

The use of rifles with moving targets will at once show the value of these hints on speed. There are two general styles of shooting at running game. One may follow its movements with the gun, and so come up in a kind of pursuit, or he may anticipate the motions and have his sights lined up in waiting. Of the two, the brisk follower will get more shots, but the shrewd anticipator will often make a bigger percentage of kills for the number of shots fired. Of course, the ideal rifleman combines both systems and takes all the chances that offer.

ROWING

Rowing has been an officially recognized sport for only a little over a century. The adoption of outriggers—steel frames for placing the row-locks well out at the side of the boat—started in 1845 the rapid movement toward the long, narrow, light racing shells of our day. The sliding seat was first used in a race in 1870.

At present an eight oared shell is about sixty feet long, two feet wide, and weighs around two hundred seventy pounds; and a single shell is about twenty-six feet long, eleven inches wide, with a weight of twenty-eight pounds.

To row with an oar in each hand is called "sculling." Sculls are a little less than ten feet long. When each man pulls one oar in a team or crew, the oars are called "sweeps," and are about twelve feet, three inches long. Races in a full rowing regatta are likely to include single and double sculls, and sweeps in pairs, fours and eights.

A full crew of eight men is accompanied by a coxswain, who sits in the stern facing forward, steers the boat, keeps the captain posted and advises him about the pace. In spurts a racing crew is likely to finish a short race at about forty-one strokes to the minute. Longer courses of three miles or more take a steady pace of about thirty-three, and quicken at the finish to thirty-eight or better.

The first oarsman facing the coxswain is the captain or stroke oar, who receives the advice of the coxswain and himself sets the rowing pace. Other oarsmen must of course follow his lead accurately or there can be no hope of winning. Good generalship is required in placing the men, both to balance the boat and to match men in pairs according to strength. In general, of course, the less the rudder has to be used, the more energy can go toward the goal flag.

Much depends on form. The sliding seat makes it possible to use muscles from neck to toes, but it is no easy matter to bring these into smooth agreement. Practice commonly begins with rowing machines in a gymnasium long before the spring opens. Each new man on a crew adds to the problems of training.

Certain types of stroke have proved advantageous. Best results require that the oar blades should not be deeply plunged during the stroke, but should be only well covered by water. Feathering is universal, in order to cut the resistance of the air in the backward thrust of the oar. To feather is to give such a downward flip to the wrist and forearm as to make the oar blade skim along nearly parallel to the surface of the water in the recovery after each stroke.

If the oar is spoon-shaped, it is sometimes allowed to touch the water lightly as it swings back, thus sustaining a part of the weight of the oar on the water; but more than a very little of this saves the rower at the expense of the pace.

Rowing is a favorite intercollegiate contest wherever practicable, but it is by no means limited to that range. Boat clubs practice the world over, and annual regattas are of national and international interest.

SKATING

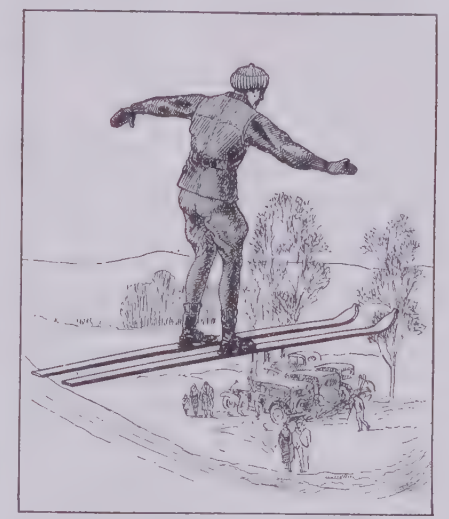
There are two general types of skating—one emphasizes speed, the other values grace and ingenuity. Each has its devotees, with national and international contests annually.

Speed records in skating do not differ greatly from sprinting records on foot, as may be inferred from the fact that the one hundred yard dash on skates is made in from eight to twelve seconds.

By official agreement, the title of champion in international speed contests goes to the winner of three out of four races, the distances being 500, 1,500, 5,000, and 10,000 meters.

Figure skating contests are conducted annually, but in America arouse less interest than speed racing. As a sporting proposition, Americans are chiefly interested in skating as a means of playing hockey. But the recreational popularity of skating is very great, and is pretty sure to remain so.

The modern ice skate differs radically from its antecedents of a generation back. In 1890 "club" skates were fastened by adjustable clamps; the skate was likely to come off at embarassing moments, often bringing a sole of shoe with it. No special shoe was required, except as to strength at the sides of the soles. The skates were all steel, with blades about three-sixteenths of an inch thick, resting on the ice at only one point of an arc, thus earning the name of rockers. Newer types came in with the popularity of hockey, and were designed for quick stops, speed, lightness and safety. A skating shoe is now a permanent part of the outfit, riveted fast to the plates of the skate. The blades are long, thin and straight and borne on three aluminum tubes, one horizontal, two vertical.



Much old-time grace has been sacrificed to speed in the change of blade design. Rockers tended to curves and to pleasing variations of balance; hockey skates tend to straight lines and a general firmness of movement, rather than to grace.

SKIING

Skis are the descendants of the long narrow, leather-covered snowshoes used in northern Europe since very ancient times, but popularized in our generation by the sports of Norway. Skis are now thin, flat strips of oak, ash or spruce, five or six inches wide, about eighteen inches longer than the user is tall, smooth or ribbed lengthwise on the bottom, thickest under the feet, and fastened with straps across the toes, like snowshoes.

There are two types of official contests with skis: the jump and the long distance across country trip. Of late years, the distance record in jumping has been held in America, clearing a distance of 214 feet, or better. When one remembers the terrific velocity necessary to gain this distance and the fact that a fall in landing cancels the jump, the feat seems to require incredible daring and skill. In the United States, Michigan, Wisconsin, Minnesota, and the Rocky Mountain country are chiefly interested in ski jumping. The sport is gaining in popularity wherever deep snows prevail in winter.

Skis have practical uses in the Scandinavian sections of Europe. They had a considerable place in the Alpine campaigns of the World War. Soldiers of continental Europe are giving increasing attention to them. Military ski runners have covered fifteen miles in an hour and a half, under favorable conditions.

The Ski Jumper
A popular sport in regions where deep snows prevail.

Skis require a depth of at least six inches of snow for best service. They do not work well in melting snow nor in thick underbrush. In such unfavorable conditions they yield to the snowshoes perfected by American Indians.

SNOWSHOEING

Unlike skiing, snowshoeing has little of the spectacular about it. One can get the knack of it in a few minutes; the rest is an affair of training the leg and foot muscles to an unaccustomed straddle, heels up, toes down. Assuming that there are bound to be occasional falls, one does well to practice for them at first, so that the general tangle of pack. snowshoes and snowshoer may be less hopeless when the time comes. After the novelty wears off, snowshoeing becomes a workaday affair of getting where one wants to go but could not go without this Indian legacy.

SOCCER

The rules of association football, known in the United States as "soccer," were first formulated at Cambridge University, England, about 1860. The game is steadily growing in popularity in this country, especially in grammar schools.

The field is rectangular, commonly about seventy-five yards by one hundred fifteen yards, with well-marked boundaries. At the middle of each end are goal posts eight yards apart, with a crossbar eight feet up. A mid-line divides the field across, and from the middle of this line a circle is drawn, with a ten yard radius. Flags mark each corner of the field. In front of each goal is a goal area, twenty yards by six yards, running twenty yards along the end line. Enclosing the goal area is a penalty area, eighteen yards by forty-four yards, running forty-four yards along the end line. A penalty kick mark is twelve yards in front of the mid-point of each goal line. A corner kick area is a quadrant drawn from each corner with a radius of one yard.

The ball used in soccer is round, unlike the Rugby ball.

Soccer rules resemble those for field hockey. The ball may be advanced only by kicking. A goal is made when the ball is kicked under the crossbar, not over it. Two teams of eleven men each are placed as in field hockey—a goal-keeper, two full backs, three half backs, and five forwards.

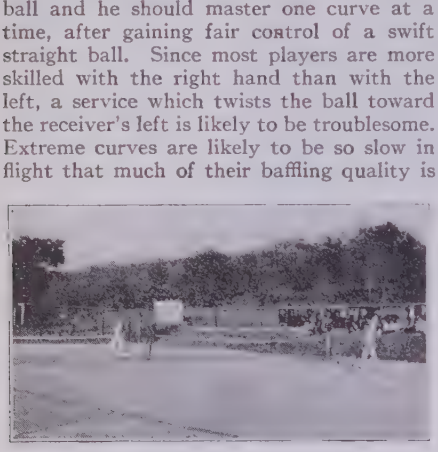
A player is offside when the ball was last touched by a member of his own team behind him; provided that the presence of three or more opponents ahead of player A, at the instant his teammate B kicks the ball, makes player A onside, and provided further that a player cannot be offside who was in his own half of the field when the ball was last played.

A player offside cannot put himself onside. This must be done for him in one of three ways: (1) An opponent may play the ball. (2) The offside man may be behind the ball when a teammate plays it. (3) Three opponents may be ahead of the offside man when a teammate behind him plays the ball. "Take care that when the ball is played by one of your own side you have three opponents between you and their goal line or that you are in line with or behind the ball."

No one but the goal-keeper may catch the ball, or bat it with his hands, arms or shoulders, and he only in actually guarding the goal.

The game is played in two halves of twenty to forty-five minutes each, according to the age of the players.

Toss-up awards choice of goal or kick-off at the beginning of the game; goals are exchanged at the beginning of the second half.



Play is started by a kick-off at the center of the field. At kick-off no member of either team may cross the mid-line until the ball is kicked, nor may any opponent approach within ten yards of the ball until that time. After the scoring of a goal by either team, their opponents kick-off at center.

If the attackers send the ball over the end line outside the goal posts, a member of the defending team has a goal kick from within the goal area, no opponent being permitted within ten yards. The ball is in play as soon as kicked.

If the defenders send the ball over their own goal line, the attackers have a free kick from the nearest corner circle, no opponent within ten yards.

If the ball crosses a side line, a member of the team which did not drive it out shall

speed and control in striking the ball, not only in service, but in return. A good player has at command not only swift, straight balls, but a variety of curves and "cuts." A beginner will do well to study both the flight and the rebound of a curved ball and he should master one curve at a time, after gaining fair control of a swift straight ball. Since most players are more skilled with the right hand than with the left, a service which twists the ball toward the receiver's left is likely to be troublesome. Extreme curves are likely to be so slow in flight that much of their baffling quality is

Tennis Players in Action

offset by the added time given for solving them. If an opponent is playing too far back, an under cut dropping the ball near the net will be pretty sure to win or lose the point. If the opponent is too close to the net, a bit of upper cut in the high lob sent over his head will help to bring the ball down within bounds. Batting the ball against the smooth side of a building is a very useful exercise in gaining control of the racket.

TRACK AND FIELD EVENTS

Track and field events show little team work, except of a mild sort in relay races. These contests are rather individual struggles against rivals all doing the same thing, in an attempt to win honors or trophies for themselves or for their organizations. When rival athletic organizations meet points are scored for the winning of each event under rules which vary with the age and sex of the contestants or the custom of the groups concerned.

The control of athletic events in this country is largely in the hands of a few associations: elementary and high school unions are local, intercollegiate associations are broader in range, and the Y. M. C. A. and Amateur Athletic Union are national.

The commonly recognized distinction between amateur and professional athletes is that a professional has received money for his services as a player or a coach. This definition is often unjust in various ways. Payment may be in forms other than cash, and the occasional acceptance of money for taking part in games does not in any way indicate a really professional attitude toward the game in question. The definition is likely to be revised in the near future.

The terms "track" and "field" are commonly used together to cover all sorts of contests in running, jumping and weight throwing. The names of these contests and a short statement of the rules and customs holding in each will be given in turn.

Officials. Each athletic meet is in the general charge of a referee, whose word is final in the matters he pronounces on, subject only to a later protest, in certain cases, before a governing committee of the association he represents.

The referee's assistants are:

Clerk of the Course, who records all entries, investigates records with a view to handicapping contestants, assigns numbers and otherwise busies himself.

Starter, the man behind the gun.

Inspectors, for relays and running races above 300 yards, to make sure that the rules are fairly observed in the distant parts of the course.

Judges at the finish, who pick the winners.

Timekeepers, with stop watches registering fifths of seconds.

Scorer, the secretary of official results.

Field judges of jumping, weight throwing and vaulting.

Marshal, to maintain order and clear the track.

All contestants report to the clerk of the course on arrival, register, enter for certain events, receive handicaps according to previous records and receive a number for the meet. They must learn in advance the exact time for each event in which they are to appear and be on hand unless officially excused.

Sprints, or dashes, cover any distance up to 300 yards. The course is divided into lanes, one for each contestant. These lanes are assigned by lot. Runners who are not handicapped start from scratch, a line drawn across the track. A runner's body may overhang this line at the start, but he may not in any way touch ground beyond the line before the starting signal is given. This starting signal is always in three stages, for which the words are: (1) "On your mark!" (2) "Get set!" (3) "Go!" For all races, except time handicaps and cross-country runs, a pistol shot is used instead of the word "Go!" A crouching start aids a quick getaway in all sprints and dashes.

Fouls in all Running Races are as follows: (1) Running without a number, unless permitted by the referee.

(2) False start—touching the ground beyond the starting mark before the signal is given. Penalty, a distance forfeit in yards for the first two offenses, disqualification for the third.

(3) Receiving coaching or other aid during a race.

(4) Hindering a competitor in any way during a race.

(5) Grasping the tape at the finish. Hands should be held high or thrown back.

(6) Unsportsmanlike conduct, or disputing the judgments of officials.

(7) Crossing in front of competitors after rounding the last turn toward the finish, or at any other time unless six feet or more in advance of the man whose trail is crossed.

When there are too many runners for a decision in one trial, the race is run in heats, the winners of each heat entering the finals.

In championship races up to 300 yards, under official rules, each runner must have a separate course, marked off with ropes or permanent lines.

Men are making good time in the dashes at the rate of nine and three-fifths seconds to ten and three-fifths seconds per 100 yards, or about ten yards each second. Women's colleges report the 100 yards in about twelve seconds.

Running. *Cross-Country Runs* are usually between teams of an equal number, over open country, to a total distance of six miles. Scoring may be individual, or may be based on time made either by the entire teams, or by the first five members to arrive at the finish.

Cross-country speed for six miles is about 32½ minutes.

Hurdle Races combine running and jumping. A hurdle is a gate-like obstacle which the runner must leap over as he comes to it. There are two standard hurdle races—one of 120 yards with ten high hurdles, (three feet six inches); the other 220 yards with ten low hurdles, (two feet 6 inches). In championship races, the location of each hurdle is exactly prescribed. A runner is permitted to knock down two hurdles, but not more, under penalty of disqualification.

Adult men do the short hurdle races in fifteen to seventeen seconds, the long one in twenty-five to twenty-seven seconds.

Middle Distance Runs. 300 yards to one mile.

Long distance runs—the cross-country and Marathon—depend more on endurance than on speed. Dashes require speed and quick nervous reactions. Middle distance runs are likely to begin vigorously, to use a moderate middle pace and to end with a dash. On this account, all distance runs should end in a straightaway course.

The 440 yard races commonly use the crouching start; longer races get away from the standing position.

Rules are as in dashes.

Good time for adults, including members of high schools and Y. M. C. A.'s, runs for for various distances about as follows:

440 yd.—47 to 54 sec.

880 yd.—1 min. 50 sec. to 2 min. 5. sec.

1 mile—4 min. 15 sec. to 4 min. 47 sec.

Relay Races. As used in adult athletic contest, a relay race is an affair between two or more teams, usually of four men each. When the teams are of four men, each man does one-fourth of the total distance. The first runners are started as in dashes; no other runner may start until he has been touched by the teammate next before him in the race. Commonly, each team passes through from man to man a token which is delivered at the goal, automatically proving the fairness of all the contacts. The touch-off, or delivery, of tokens must occur within a twenty-foot space marked off for the purpose. An inspector is stationed at each of these starting points to see that the rules are complied with.

Relay races are commonly run on regular tracks, with distances from 300 yards upward, usually such that each runner can go through his part of the distance at top speed. The speeds obtained in relay races are likely to be faster than the runners would make in single competition.

Walking Races are commonly for one-half mile, one mile or two miles. No walker may have both feet off the ground at once. A judge accompanies the walkers to enforce this rule.

Championship time will be about one mile in seven minutes.

Jumping. *Pole Vault.* The requirements for a pole vault are: A runway eight to ten feet wide and twenty yards or so long; uprights notched or pinned for half-inch lifts of the crossbar; a landingpit of soft earth or sawdust. Between the uprights a wide plank is sunk, edge up, cross-wise, with two inches projecting, to stop the bottom end of the pole. In front of this plank a hole is dug for the same purpose. Fifteen feet in front of the bar is a balk line, not to be crossed before the take-off. Poles are about sixteen feet long, of spruce or bamboo, wound for grip, and plugged or spiked at the lower end.

Good form is very important. The pace must be managed to bring the jumping foot to the balk line; one hand grasps the po e slightly below the height of the cross-bar, the other hand two feet higher up. The run is finished at top speed. As he comes to the balk line, the runner places his pole, lifts one foot, springs from the other, slides the lower hand up on the pole, lifts the body by the pull and thrust of both arms, turns to a horizontal position above the pole, feet forward, drops the pole back, and lands on his feet in the pit. Most jumpers land facing the bar. A good landing is important for safety.

The jump is fair and the height is recorded if the crossbar is not displaced by either the pole or the person of the jumper.

Field judges officiate.

Records for men run from twelve to thirteen feet.

Running Broad Jump. This event requires a 40 yd. running path of cinders or firm earth, leading to a take-off plank, beyond which the soil is dug up for safety in landing. The take-off plank varies in width, the standard being 5 inches., but is always sunk broad side up, flush with the ground level. At the edge of the plank next the landing pit, the soil is dug out several inches for leverage in springing from the plank.

Each contestant takes as much run as he pleases—the ordinary run is about six paces—so timing his steps as to bring his jumping foot on the take-off plank for the spring. If the running path is soft or the wind unfavorable, more is lost than gained by long runs. The runner approaches the board at full speed, lands solidly on his jumping leg, and without pause makes a crouching spring; flings his arms forward for the bit of boost that gives, and while still in the air thrusts his legs forward, in order to make his mark as far from the plank as possible.

Jumps are measured from the forward or unburied edge of the take-off board to the nearest mark made by the jumper in landing. On this account he must be careful not to fall backward or even throw a hand to support himself in landing, for the marks so made will lower his record.

Field judges are the officials for jumping.

When a large number of competitors are entered, each has three trial jumps, and a convenient number of winners from these trials enter the final competition. In the final competition each man again has three jumps and the best of the three jumps made by each man is his record for the event.

Running High Jump. General management as for all other jumps. Required, a landing pit of soft earth, dug up twelve feet square; a pair of uprights twelve feet apart, bored for pegs to support a light crossbar; a V-shaped running ground, such that contestants may get a twenty-yard approach from either side. It is not good form to approach the bar from the front. In intercollegiate practice, a balk line is drawn on the ground three feet from the uprights; the runner must not step beyond this line before he springs.

Displacing the bar or leaving the ground in any attempt shall count as a trial. An illegal jump shall be one in which the competitor dives or somersaults over the bar or jumps in such a manner that his head crosses the bar in advance of either foot. Since height, not broad distance, is required, the approach should not be too fast. The take-off is from right or left foot according to the direction of approach. The leg nearest the bar is first thrown over, then a twist to clear the hips, a flip of the second foot, and a landing on the foot that made the take-off.

Three trials are permitted at each height. A contestant may decline to try any particular height, and may come in at a greater height later on, but there may be no return to lower levels, except to break a tie.

Handicaps are added to the score of the opponents.

Good records for high schools are above five feet six inches, and for colleges, above six feet.

Running Hop, Step and Jump. The start is as for running broad jump. The foot that makes the take-off must make the first landing; the opposite foot at once takes the step; then without a pause both feet register the final jump. The distance is measured from the scratch line or bare edge of the take-off board to the nearest trace of feet, body or hands in the final landing.

Standing Broad Jump. This event uses a regular take-off board, with both feet on the board when the spring is made. Toes may overhang the edge of the board, for starting thrust. If, as sometimes happens, the jump is from a scratch line on the ground the toes may touch this line but must not overreach it.

Three trials are used, as in the running jumps.

Field judges are in charge.

Records for standing broad jumps go to eleven feet, four and seven-eighths inches.

Standing High Jump. This is made from any position, with one or both feet, but without preliminary hops or jumps.

Good scores for adults must be close to five feet. The record is a few inches above it.

Three Standing Broad Jumps. Managed as broad jump, above. The jumper must not stop, even for one extra set of motions, between jumps, but must spring to his second and third immediately on landing from first and second.

Adult records run above forty-five feet for three jumps.

Throwing. *Baseball Distance Throw.* From within a six-foot circle. The thrower steps from the rear half into the forward half of this circle, but must not cross the line.

Women's records go well above 200 ft.

Basket Ball Distance Throw. Managed like the baseball throw. The basket ball and baseball throws are not now commonly included in intercollegiate events.

Throwing the Javelin. This is a Swedish event, imported, like the discus throw, from the modern Olympic games.

The official javelin is eight and one-half feet long, weighs one and seven-tenths pounds or more.

The thrower runs about eighteen yards to a restraining line, and without touching or over-stepping that line, launches his javelin. The score may be taken for either hand, or for both added together. The best score for one hand runs over 200 feet, and for both added together, about 359 feet.

Throwing the Weights. (1) *The Shotput* is made from within a seven-foot circle, which the contestant must not cross in making the throw, or leave from the front before the throw is measured. A toe-board is fastened near the forward edge of the circle, for the thrower's convenience. The weight of the shot varies with the age of the contestants. The standard is sixteen pounds.

The shot must be "put," not thrown—that is, it must not be drawn back of the ear in line with the shoulder; at the beginning of the action, it rests usually *on* the shoulder, in the hand as near the end of the fingers as strength permits to give leverage. Form is important: (1) a half crouch at rear of the circle, the weighted shoulder drawn far back and low; (2) a sliding hop forward; (3) a twisting shift of the feet and an upward lunge of the whole body, while the putting arm straightens, and even the fingers add their flip at the end, like the kick of the toes in swimming.

Each contestant has three trials. The best of the three is his record for the event.

Field judges.

Good adult distance for the sixteen pound shotput is forty-five to fifty feet.

There are two styles of throwing the discus—one, the old Greek form, with prescribed motions from a fixed position; the other, a modern free style, managed much like the shotput, except that the discus is really thrown, with a full arm swing.

The discus is a double convex wooden contrivance, iron-bound and metal-faced, diameter about nine inches, weight about four and one-half pounds.

Scores of ninety-seven feet have been made in Greek style, and 135 to 150 feet, free style.

(2) *The Hammer Throw* is from within a seven-foot circle which must not be crossed in throwing, and which may be left only from the rear.

The standard hammer is of metal, with a wire handle; total weight, sixteen pounds, total length not over four feet.

Good form requires one, two or three complete turns of the thrower before he releases his hammer. If he can control himself, two turns are better than one, and three are better than two, since speed can be built up throughout. Intercollegiate and adult records with the hammer run from 160 to 190 feet.

(3) *Throwing the Fifty-six Pound Weight.* Same general conditions as for shotput and hammer throw. Throwing this weight is like throwing a very heavy hammer with a very short handle. The overall length of this weight must not be over sixteen inches.

The record is close to fifty feet, six inches.

TRAP SHOOTING

Shooting with the rifle at running or flying game is so difficult a sport that there is no disgrace in using a scatter gun for the purpose, and it does less harm to the landscape. The drift of practice with both rifles and shotguns has been toward smaller and smaller bore. In 1875, a ten gauge shotgun was the ordinary thing; in 1900, twelves were in order; now the sportsmanlike bird hunter uses sixteens and twenties. He has all the advantage of the argument. Whether the gun shall be a repeater or double-barreled, is entirely a matter of taste. There is a good deal of force in the notion that all of the guns taken to the woods should have the same type of action.

Trap shooting is in itself a sport with many thousands of adherents. Even unredeemed pothunters find that it pays to practice the leads at unknown angles on clay birds. One doesn't like to miss the few chances he gets in the autumn. A Dupont hand trap costs only a few dollars, and does first-class work. It is as hard to learn to shoot by the book as it is to learn to swim in that way. Practice is the big thing, but theory helps. For instance, a flock of teal in full flight goes about ninety miles an hour. If we assume that shot travel 1,000 feet per second, it is easy to figure that the lead for a cross-flight of these birds at ten rods distance will be about twenty-one feet. But the angle of flight makes a very great difference in the amount of the lead, and something is also to be allowed for the drop of the shot. So it appears that a man who can make a high score at flying marks in all directions, with speeds up to ninety miles an hour, is an artist worthy of respectful approval in his field.

VOLLEY BALL

Volley ball is a lively and interesting game between two teams of any convenient number of players.

Across the middle of a rectangular field, not larger than thirty feet by sixty feet, a net is stretched, the upper edge seven and one-half feet from the floor. The object of each team is to keep the ball beyond the net in the enemy's country, and to prevent its striking the ground in home territory.

No matter how many play, each player must take his turn at serving the ball and must continue to serve until his side is out, by reason of faulty service, foul or failure in returning the ball. To serve a ball, a player stands back of the end line in his own court —he may have one or both feet on the line— tosses up the ball, and bats it with his hand toward the opponents' court, as it comes down. He may use either or both open hands, but must not use doubled fists. The ball need not go over the net on the server's stroke, if other members of his team can keep it from touching the ground, and eventually get it over. But in any one such attempt, no one player may touch the ball a second time.

When a team makes a foul or fails in service or return the referee calls "side out"; service passes to the opposing team, and each of the losers moves on one stage in his rotation toward service.

Catching or holding the ball is illegal; dribbling (touching the ball twice in succession) is prohibited. Players must not delay the game by batting the ball about unnecessarily; they must seek legitimately to advance their score.

Served balls are dead if they touch the net, but returned balls may be recovered from the net.

The ball is dead when it touches the floor, when it touches any object outside the court, or when the referee blows his whistle. No player may touch the net or reach over the net to strike a ball. No player may be helped or supported while striking the ball. Players must remain in their own court. If the serving side make a foul the ball goes to the opponents, and there may be an additional penalty of a point added to the opponents' score if the foul is for unsportsmanlike conduct or for addressing officials. A foul by the receivers adds a point to the servers' score. Only the servers may score, except for fouls.

The officials are a referee and two linesmen. The referee is chief official, and works near the middle of the field, with a linesman at each end.

A standard volley ball is somewhat smaller than a basket ball, though a basket ball will do when the game is played for recreation only. For the net, any tennis net will serve.

WRESTLING

Wrestling is a sport consisting of the hand-to-hand encounter between two unarmed contestants who attempt to throw each other. It is no doubt as old as man, but the rules of the game have changed from age to age. In the old Greek wrestling matches, for instance, no hold below the waistline was permitted. In the Irish collar and elbow contests neither man may for an instant let go his hold on his opponent's collar.

In this country wrestling means catch-as-catch-can, and a fall is secured whenever both shoulders squarely touch the floor at once. Only strangle holds, shutting off an opponent's wind, are barred. At least twenty-five different holds are named and distinguished by professional wrestlers.

The arm and neck, foot hold, toe hold, quarter Nelson, and further Nelson are generally preliminary to other holds. A number of holds, for example the toe hold, are not productive of falls, but are so painful that the victim concedes a fall in order to escape.

There is not much value in a mere list of wrestling positions. The movements involved, the changes from one hold to another, the escapes and counters are often so fast and complicated that only a moving picture or a living instructor could tell the whole story. Wrestling is an art worth any young man's time. Champion wrestlers must have not only tremendous all-round muscular development, but mental alertness to match.

A fairly complete list of wrestling holds follows:

Arm and leg; arm and neck; arm drag; arm grapevine; arm roll; chancery; chancery and bar; cross buttock; crotch hold; double body hold; double Nelson; double thigh and crotch; double wrist; elbow and back heel; flying mare; foot hold; further Nelson; half Nelson; hip lock; knee hold; quarter Nelson; scissors; single wrist; sit back; strangle holds (barred); three quarter Nelson; toe hold.

BOOK XIII

GOVERNMENT AND LAW

IN ALL countries which are democratic, people are rapidly coming to regard their political organizations as servants of the people, and government as simply a certain number of citizens set aside in each political unit and in the nation, and empowered by the voters to undertake certain tasks for the people. Although this ideal is not fully carried out in practice, it is wonderful progress that we now regard government as an agency to care for the needs of the people rather than an agency of a ruling oligarchy.

Why We Need Government. Primitive man did not have much government, for his needs were so simple that he could satisfy most of them by his own individual efforts. As the number of the people and the complexity of their needs increased, government was instituted to control that which they could not well provide for themselves. At first the king undertook to care for these needs, but because of his failure to do his work well he has been overthrown and the rule of the people set up. It would be impossible for the individual family of today to produce its own food; provide its own shelter; protect itself from criminals and disease; educate its own members; carry its own products to the consumers, and bring its needs to the family fireside. Today we are very largely dependent upon one another for freedom, health and safety, as well as for the necessaries of life. In his relation to the government, the individual who lives in a modern democracy bears a twofold relationship; he has duties to perform, and in return for them he obtains protection and help in the performance of his regular activities.

The Capitol of the United States at Washington

Functions of Government. According to Woodrow Wilson, in his book, *The State*, there are eight essential functions of government:

(1) To keep order and provide for the protection of persons and property from violence and robbery.

(2) To fix the legal relations between man and wife and between parents and children.

(3) To regulate the holding, transmission and interchange of property, and the determination of its liabilities for debt or for crime.

(4) To fix the contract rights between individuals.

(5) To define crime and provide for the punishment of criminals.

(6) To provide for the administration of justice in civil causes.

(7) To determine the political duties, privileges and relations of citizens.

(8) To regulate the dealings of the State with foreign powers, to preserve the State from external danger and to advance its international interests.

There are very few people who object when government performs the above duties. However, there is much dispute when the government attempts to push its authority further. When the public authority begins to regulate commerce and labor, as it often does; to provide for internal improvements; regulate postal and telegraph systems; own or control public utilities such as telegraph and telephone systems, railroads, power and gas plants; to establish rules for the control and development of education; to care for the poor and incapable, and to set up sumptuary laws, such as "prohibition," we find the public divided into three rather distinct groups. One favors the policy of governmental interference with these activities; another opposes them, and the third is more or less indifferent to them until it has been won over to support them by one or the other of the more active groups.

The ever shifting control of the government in democratic countries from one political party to another is to be accounted for by the fact that either the advocates or opponents of further extending political authority have, for the time being, persuaded the "indifferent" that their policy is correct. Political activity of today operates somewhat as follows: An active minority believes that it would be advantageous for the government to exercise more control over commerce, labor, education or any of the optional functions of government. This aggressive group begins to win supporters for its course by public speeches, or by printing its convictions in the newspapers and magazines. In the course of time an election is held and this group scores a victory. In the meantime the opposition has set its forces to work. It started its work soon, after the advocates launched their campaign, but due to the fact that opposition is often slow to develop, the measure of the active advocates is carried. However, this defeated group (if there is much at stake) becomes the aggressor and continues its campaign, sometimes quietly and at other times loudly, fully expecting to win at the next election. The victors, fully confident that they have won, fail to continue the defense or do not defend well enough. Then, at the next election, the policies of the group that had won at the earlier election are fully or partially repudiated by the voters. Thus the struggle continues until, "in the course of human events," sufficient scientific knowledge is evolved to establish a new political principle or to show that what has been advocated is of no political value.

The Need for the Study of Government. Inasmuch as political policies and their administration in our republic fall in the last analysis upon the "will of the people," it greatly behooves all well meaning and earnest citizens to make a careful study of the science of government. Every citizen should make it his business to know as fully as possible what his government is, and how, by doing his civic duties, he may improve it.

In a long and costly struggle with kings and nobles our forefathers have won for us the right to control our own political affairs. That victory is now ours and we are enjoying its benefits. Some one has said that the big political battle of the last several centuries was the struggle for the right to vote, and that the biggest political problem of today is to learn how to vote intelligently.

GOVERNMENT OF THE UNITED STATES

IN its fundamental aspects, American government, originated in the actual experience of the English colonists, gained by generation after generation in managing their own political affairs. When the colonies were established, the English authorities had no thought of setting up new governments.

The Colonial Period. In origin, each of the English colonies was either a grant of privilege to an individual—like Pennsylvania to William Penn—or to a corporation, like Virginia or Massachusetts Bay. However, due to the fact that those who settled in the colonies were brave, venturesome individuals, not desirous of asking favors of royalty, and the fact that they were three thousand miles from the seat of the central government, which was more or less indifferent to their interests, self-government quickly found roots in the soil of America.

When the American Revolution occurred there was very little that was fundamentally new in the way of political institutions. The Revolutionists of Rhode Island and Connecticut, where the governors, councilors and judges were not appointed by the crown, but created solely by the colony, found their colonial systems of government, based on seventeenth-century charters, so well suited to their needs and ideals that they made no alterations in them other than casting off their allegiance to the King of Great Britain. The royal charter granted to Connecticut by Charles II in 1662 remained the constitution of that state until 1818, and the charter of Rhode Island, granted in 1663, remained in force until 1842. In all of the states after the Revolution, the distribution of representation, the suffrage, the qualifications for holding office and the legislative, executive and judicial institutions were continued without many radical alterations.

On the eve of the Revolution, the thirteen colonies had forms of government which presented striking similarity. Each had a governor, an assembly and a judicial system, and the common law of England, as far as it was applicable and had not been changed by legislation, was binding in all of them.

In eight of the colonies—Massachusetts, New Hampshire, New York, New Jersey, Virginia, North Carolina, South Carolina and Georgia, the governor was appointed by the king and recognized as the king's personal deputy. But, on the other hand, he was the highest executive official in the colony, and as such was charged with the preservation of peace and the advancement of the welfare of the colonists.

The governor, as the chief executive, supervised the enforcement of the laws and appointed, usually with the advice of his council, the important civil officers. He could, except in Massachusetts, remove any of the council and other officials for cause, and direct them in their work. By virtue of his position as chancellor, he was head of the highest court in the colony, which handled appeals from lower courts and exercised important original jurisdiction in many matters. He also granted pardons and reprieves. He was commander-in-chief of the colonial forces, appointed the military officers of high rank, levied troops for defense of the colony and enforced martial law when that was necessary owing to war, invasion or rebellion. Since he was the king's ecclesiastical representative, he exercised considerable ecclesiastical authority also.

The royal governor also enjoyed extensive powers in connection with the colonial legislature. In all of the eight colonies of this type, except Massachusetts, he nominated the council, which composed the upper house of the legislature. He summoned, adjourned and dissolved the assembly; he placed before it projects of law desired by the home government, and exercised the right to veto all laws which he considered objectionable.

It must be remembered, however, that the royal governor was by no means an unlimited sovereign in his province, for he was bound by his instructions from the British government and by restraints which the assembly imposed through its power of controlling grants of money. Furthermore, complaints against his actions often were taken to the board of trade or to the king in council across the sea.

In Massachusetts, the governors which were appointed by the king had their powers somewhat restricted by the colonial charter. The governor could adjourn, prorogue or even dissolve the assembly; but he could not appoint the members of the upper house; and all civil officers were appointed by him with the consent of the council. In other important respects the governor of Massachusetts enjoyed practically the same power as the other royal governors.

In Rhode Island and Connecticut the governor was elected annually by a general assembly composed of the governor, assistants and representatives chosen by the voters in each "city, town or place." In these colonies the governor did not stand out as a separate and distinct official. His duties were performed only in coöperation with the assembly and council.

The executive authority in the proprietary colonies of Maryland, Pennsylvania and Delaware differed vastly from that of the other colonies. The proprietary colony was a vast estate, carved out of the royal domain and granted by the crown to a proprietor. When the proprietor was in the colony he had the right to assume control of the executive authority there and when he was absent he vested it in a lieutenant-governor, who served in the capacity of agent for the real owner of the estate. The power of the governor in these colonies was less limited than in any of the others; but toward the end of the colonial era there was a gradual decline of his power, due to the rise of power of the assembly to control appropriations.

All of the colonies had two branches of the legislature except Pennsylvania, which had only one. In Massachusetts, Connecticut and Rhode Island the upper house was elected by the assembly; in the proprietary colonies the proprietor or his representative selected the councilors; in the other colonies the upper house, or council, was chosen by the king acting through the royal governor, who usually made the selection himself.

The council enjoyed the right to discuss and vote on all laws, and with the governor enjoyed executive and judicial functions. It advised the governor on many important matters, and in conjunction with him it formed the highest judicial tribunal in the colony.

In every colony there was an assembly of representatives chosen by popular vote; but, contrary to common impressions, there was nothing like universal manhood suffrage. In every colony there were restrictions on the suffrage, which were usually educational, property or religious qualifications.

The colonial assemblies from an early period of colonial history maintained that they possessed entire and exclusive authority to regulate their domestic concerns. In the matter of taxation they stoutly asserted their exclusive rights not only in formal declarations but also in actual resistance to the royal and proprietary governors. In addition to general legislative power, the assemblies usually exercised a large control over the executive department through their power to withhold the salaries of the officials.

The lowest colonial courts were those of justices of the peace, who were generally appointed by the governor, or in some instances elected by local freeholders. In civil cases these justices had jurisdiction over cases involving small amounts; in criminal matters they were allowed to try only the pettiest offenses against the law. In Massachusetts and a few other colonies the practice of uniting all of the justices of the country in a general court was followed; this court not only exercised criminal jurisdiction but supervised roads, bridges and similar affairs.

Above the justices of the peace there usually were the county courts whose judges were appointed by the governor, except in New Jersey where they were elected. In most colonies the county court had criminal jurisdiction over all except capital cases, but in Massachusetts, criminal matters were taken care of by the regular sessions of the justices of the peace. The county courts also had civil jurisdiction in cases involving certain amounts that were specified by law in each colony.

A high court was set up in each colony to decide weighty matters and appeals from the lower courts. In the royal colonies the governor, acting as chancellor, and his council generally composed this tribunal. In Massachusetts it consisted of a chief justice and four associates, appointed by the governor and council. In Pennsylvania the supreme court was composed of a chief justice and three associates, chosen by the governor.

Of course, appeals always lay from the highest court in the colony to the king in council, and this power was frequently exercised just as certain cases are appealed to the Supreme Court of the United States at the present time.

Important Steps Toward Union. (a) From 1643 to 1684 Massachusetts Bay, New Plymouth, Connecticut and New Haven colonies formed the New England Federation to strengthen their defense against the Indians, Dutch and French, representatives

being sent from each. After that, in time of need, intercolonial conferences were held from time to time.

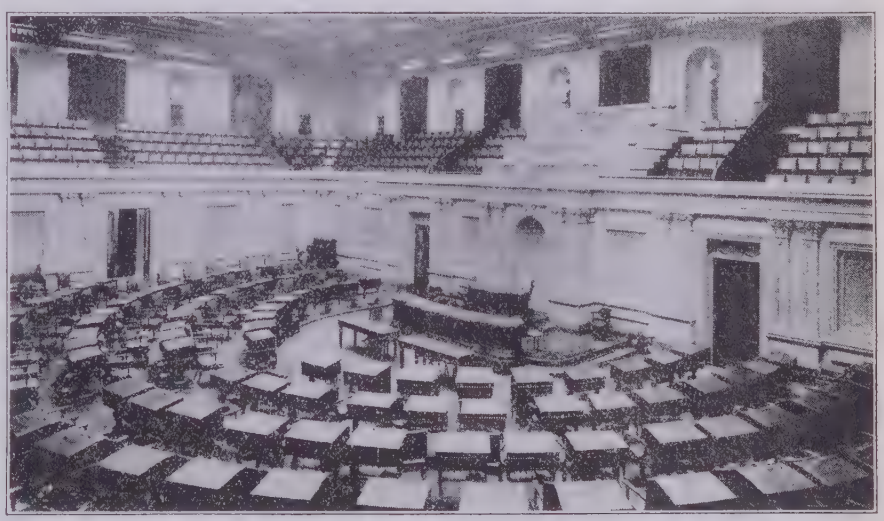
(b) In 1754 a congress of twenty-five members from seven colonies met at Albany to arrange a treaty with the Iroquois Indians and to consider other common interests. The Congress adopted Franklin's plan for a permanent federation, but it was rejected by all the colonies.

(c) In 1765, in consequence of the passage of the Stamp Act in Great Britain, at the instance of the Massachusetts house of representatives nine colonies sent representatives to the Stamp Act Congress at New York, which issued a declaration that the rights of natural born English subjects belonged to the colonists, and framed petitions to the English government for relief.

(d) Further acts of England, especially the Townshend Act, imposing taxes, led to the formation of committees of correspondence among the colonists, who thus fostered unity of sentiment against England and for their common interests.

(e) The First Continental Congress was called by Massachusetts in 1774 when the English government passed the acts providing for the coercion of that colony. All the colonies except Georgia sent delegates to Philadelphia, who drafted the Declaration of Rights of the colonies, adopted articles of association, advised resistance, and provided in case of need for the meeting, May, 1775, of the Second Continental Congress.

(f) The Second Continental Congress met, delegates from all the colonies being present. In the meantime, England had passed other measures of coercion and in attempting to seize the war supplies of the colonists, had brought on the battle of Lexington. It therefore became necessary for the Congress to make provisions for continuing resistance. In fact, it became a governing body; and with adjournments from time to time, until May 1, 1781, it directed the War of the Revolution, and really organized and managed a new state. It issued the Declaration of Independence, recommended the colonies to provide for themselves state governments, instituted relations with foreign countries and did other needed work.



(g) When the American colonies declared their independence of Great Britain they also appointed a congressional committee, composed of one delegate from each state, to draw up a form of Union for all the new states. The Articles of Union, or Confederation, thus drawn up, were discussed for more than a year and were adopted by Congress in 1777. However, they were not ratified by all the states until 1781.

This confederation provided for a league of friendship among the several states, each of which claimed to retain "its sovereignty, freedom and independence." The new government consisted of a congress of from two to seven delegates from each state, but each state had just one vote.

Congress, under the Articles, had control of making war or treaties, creating an army and navy, regulating the value of coin, arranging treaties with the Indians and settling disputes of the states regarding land claims.

In practice, Congress was unable to set up a stable government because: (1) no important law could be passed without the consent of the nine states; (2) of the failure of Congress to provide revenue for expenses; (3) of the inability to regulate interstate and foreign commerce; (4) of the lack of effective authority to enforce laws; (5) of the impossibility of remedying these defects since no amendment could be passed except by unanimous action of the States; (6) it had no power to tax; (7) the government did not act upon individuals.

(h) A meeting of commissioners from Maryland and Virginia in 1785 to discuss a commercial dispute led Virginia to call a meeting of delegates of all the states at Annapolis in 1786 to consider commercial relations. Representatives of only five states came, but among them were several far-sighted statesmen, and before adjourning they adopted a resolution offered by Alexander Hamilton calling a convention to amend the Articles of Confederation.

Home of the United States Senate
Interior of the Senate Chamber, showing desks of the senators and the visitors' gallery.

(i) This Constitutional Convention met at Philadelphia, May 25, 1787. Representatives of all the states except Rhode Island were present, among them the most noted and ablest men of the time. Various plans were proposed, important compromises (especially to settle controversies between large and small states and those concerning slavery) were made, and at length the Constitution was adopted and signed, September 17, 1787.

(j) It was then submitted to Congress, and by it sent to the states to be ratified. On June 21, 1788, New Hampshire, the last of the nine states whose ratification was needed, adopted it. The last state, Rhode Island, ratified it May 29, 1790. Congress provided an act by which it went into operation in 1789. (Text of Constitution on p. 1091.)

(k) To satisfy the wishes of several of the states, a Declaration of Rights was provided in the first ten amendments, which were ratified by the state legislatures soon after the adoption of the Constitution. Amendments XI and XII were passed to settle practical difficulties in administration, while Amendments XIII, XIV and XV were passed to clinch the results of the Civil War on the question of slavery. Amendment XVI authorizes the imposition of income taxes. Amendment XVII provides for the election of United States Senators by popular vote instead of by the State Legislatures. Amendment XVIII forbids the manufacture, sale or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from, the United States and all territory subject to the jurisdiction thereof, for beverage purposes. It provides further that Congress and the several States shall have concurrent power to enforce this article by appropriate legislation. Amendment XIX provides for nation-wide suffrage to women, by removing the limitation of sex from the right of citizens to vote.

The Federal Congress. The Congress, which has been created under the Constitution as the law-making body, consists of the Senate and the House of Representatives and has several general powers granted it: To pass laws, to judge the elections and qualifications of its own members, to determine its own rules of procedure, to lay and collect taxes, duties, imports and excises, to pay the debts and provide for the common defense and general welfare, to borrow money on the credit of the United States, to regulate commerce with foreign nations and among the several states and with the Indian tribes, to coin money and provide for certain substitutes for coin, and make provisions for controlling the value and purity of both, to fix standards of weights and measures, to establish uniform rules of naturalization, and uniform laws of bankruptcy, to establish and maintain a postal system with all needed equipment for efficient service, to make provision for the encouragement of inventors and authors by patent and copyright laws, to define and punish piracies and felonies committed on the high seas and offenses against the law of nations, to declare war and make full provision for carrying on war by land and sea by regular army and navy or by militia, and to exercise exclusive jurisdiction over all districts that are acquired for the use of the federal government in its civil or military

capacities. Besides these special powers, the right to make all regulations necessary to carry these into effect is granted and, by decisions of the Supreme Court, has been fully established.

Scarcely less important than the powers granted to Congress are the restrictions placed upon the government. It shall not suspend the writ of *habeas corpus* except in cases of rebellion or invasion if the public safety requires it; shall not pass bills of attainder or *ex post facto* laws. No money shall be drawn from the treasury, but in consequence of appropriations made by law, and regular accounts thereof shall be published; no titles of nobility shall be granted by the United States, and presents and titles from foreign governments or rulers are forbidden to office holders without the consent of the Congress.

These prohibitions are all in the interest of the people as against possible encroachments by the government.

To give needed unity of action in matters of national import the several states are forbidden to enter into any relations with foreign states and are restricted closely in their actions regarding money, the law of contracts and some other important matters. Especially rigid are the provisions forbidding state interference with interstate or international commerce and relations with foreign powers.

Sessions of Congress begin the first Monday in December. In the years following a congressional election, the term ends on March 3; in other years it extends until it decides to adjourn, usually early in the summer. The President may call special sessions.

Bills are introduced by private members, and are then referred to committees which consider and amend at will and report them with such recommendations as they see fit. These committees are nominated by caucuses of the respective parties, and are afterward formally elected without change by the members of the two houses. The committees often suppress bills, and their reports have great weight in determining the action of Congress.

The Senate (a) consists of two members from each state, elected by the people at large, each senator to have one vote, which he is to cast independently.

(b) The term is six years, the senators being divided into three classes so that one-third retire every two years, securing thus a continuing body. In case of a vacancy the place may be filled by appointment by the executive of the state until the state legislature meets, when it elects a senator.

(c) A senator must be thirty years of age, have been nine years a citizen of the United States and an inhabitant of the state from which he is chosen.

(d) Senators receive a salary of $10,000 a year, mileage of twenty cents a mile each way from their homes to attend sessions, stationery, the services of a secretary at $3,300, an assistant secretary at $1,940, and two other assistants at $1,830 and $1,520, and certain uses of rooms and secretaries of committees.

(e) The Senate, over which the Vice President is the regular presiding officer, chooses a President *pro tempore* to act in the absence of the Vice President, acts as a court for the trial of impeachment cases, a two-thirds vote of the members present being required for conviction. When the President of the United States is impeached, the Chief Justice of the United States Supreme Court presides.

(f) The Senate must approve the appointment of the higher officials made by the President, and must approve by a two-thirds vote treaties negotiated by him with foreign powers, if they are to go into effect.

The House of Representatives (a) consists of 435 members, chosen by the voters of districts in the several states, made up as nearly as practicable in proportion to the number of inhabitants.

(b) Representatives are elected for a period of two years.

(c) A representative must be twenty-five years of age, have been seven years a citizen of the United States and a resident of the state from which he is chosen. By custom the representative is usually a resident of his district, but this is not necessary; and sometimes, especially in the large cities, a representative resides outside his district.

SPEAKERS OF THE HOUSE OF REPRESENTATIVES

Congress	Years	Name	State	Born	Died
1	1789–91	F. A. Muhlenburg.	Pa....	1750	1801

(d) The salary, mileage and emoluments of representatives are the same as those of senators, except that senators from their smaller numbers have a more liberal use of rooms; the allowance for secretaries is only $4,000 to a representative, with a maximum of $3,300 for one person.

(e) The House of Representatives elects its Speaker, judges the elections and qualifications of its members, makes its own rules of procedure, and has the sole right of impeachment of executive and judicial officials before the senate sitting as a court of impeachment. Bills for raising revenue must originate in the House of Representatives; but, as the Senate has an unlimited right of amendment, the privilege is of little value. The Speaker's salary is $15,000.

Both representatives and senators are frequently consulted by the President and other executive officers in making appointments to office. Moreover, committees of either house, if duly authorized, may, during times when Congress is not in session, make investigations at home or abroad in connection with legislative measures. In such cases, while expenses are paid, no additional salary is given to members.

The Executive Department. *The President.* The chief executive is the President (a) chosen for a period of four years (b) by an electoral college, elected by the voters of the several states, usually on a general ticket, so that all electors from a state are generally from the same political party; the electors are in some states chosen by congressional districts. (c) The President must be thirty-five years of age and a natural born citizen of the United States. (d) His salary is $75,000 a year. In addition, Congress has for some years voted $25,000 for traveling expenses. He is also given secretaries; his residence (the White House), which is furnished at public expense; stables (discontinued by President Hoover); automobiles and other vehicles, and minor emoluments necessary for his position and work. (e) The President is commander-in-chief of the army and navy and of the militia when in actual military service of the United States; he grants reprieves and pardons; he makes treaties with the concurrence of two-thirds of the Senate; he nominates, and by and with the advice and consent of the Senate, appoints ambassadors and other foreign representatives, judges of the federal courts, and other high officials, some others being appointed by him alone or by heads of departments; he makes reports and recommendations to the Congress concerning the state of the nation and legislative action; he calls special sessions of Congress, receives ambassadors and public ministers of foreign powers; and takes care that the laws are faithfully executed. The President approves bills passed by the Congress, or, in the event of disapproval, returns them to the branch in which they originated. In case of such veto they must be repassed by a two-thirds vote of both houses to become effective. If he does not disapprove them within ten days (Sundays excepted) they become laws unless by adjournment in the meantime the Congress prevents their return. He may sign bills within ten days after adjournment, but those which he does not sign within this period, fail.

The Vice President has the same qualifications and is chosen for the same term and in like manner as the President. Unless the President dies or is removed or becomes incapacitated, his sole duty is to preside over the Senate. He may sit in the cabinet by invitation of the President. In case of the vacation of the President's office, he succeeds. If the Vice President dies, the members of the cabinet succeed in the order of the establishments, beginning with the Secretaries of State and the Treasury. The salary of the Vice President is $15,000.

The Cabinet consists of the Secretaries of State, Treasury, War, Attorney-General, Postmaster-General, Secretary of the Navy,

Secretary of the Interior, Secretary of Agriculture, Secretary of Commerce and Secretary of Labor. They are (a) appointed by the President, confirmed by the Senate and (b) serve really at the pleasure of the President, usually for his term unless their resignation is sooner brought about. (c) The salary of each member of the cabinet is $15,000 a year. In addition, an allowance is made for office expenses. (d) The members of the cabinet are the official advisers of the President in both administration work and political policy. In administrative matters each member exercises much discretion in the management of his department and usually really controls the selection of his subordinates who are not under civil service regulations. In matters of policy and when making important decisions, his personal judgment is of prime importance, although, of course, he must accept the decision of the President or be removed from office. Routine business is frequently managed by subordinates whose tenure of office is practically during good behavior and efficiency.

Commissions or Boards. Not all the administrative work of the national government is headed up into the ten regular cabinet departments. From time to time Congress has established several commissions or boards, the members of which are appointed by the President with the advice and consent of the Senate. The most widely known among these bodies are:

(1) The Interstate Commerce Commission, consisting of eleven members, was established in 1887 to supervise the execution of federal laws relating to foreign and interstate trade, particularly those laws relating to railroads.

(2) The Federal Trade Commission, consisting of five members, was established in 1914 to investigate and prevent all unfair competition in commerce and industry and to enforce the laws against trusts or any combinations which unreasonably restrain interstate trade.

(3) The Tariff Commission, consisting of six members, was established in 1916 to study the tariff needs of the country from every point of view and to report annually, with recommendations, to Congress. Its functions are of an advisory nature only.

(4) The Civil Service Commission, consisting of three members (not more than two from the same political party), was created in 1883, charged with the duty of examining all candidates for positions in what is known as "the classified service." It includes about ninety-five per cent of all the employees of the national government, or some 600,000 persons. Examinations are held regularly twice a year at various places throughout the country designated by the Commission. The appointees are apportioned among the states in proportion to population as far as possible, and the positions are permanent during efficiency. There are also many officials appointed without competitive examination—generally higher officers—whose services are personal or confidential in their nature, such as private secretaries, unskilled laborers or temporary employees. Employees of special commissions, for example, would fall in the last-named category.

(5) The Federal Reserve Board, consisting of the Secretary of the Treasury, the Comptroller of the Currency, and six other members appointed, like the other Commissions, by the President with the advice and consent of the Senate, was provided for by the Federal Reserve Bank Act passed by Congress in 1913. It controls the Federal Reserve System, which consists of twelve federal reserve districts with a federal reserve bank in each. These banks are reserve depositaries for the federal government and for "member banks," which must subscribe to the capital stock of the Federal Reserve Bank of their district an amount equal to six per cent of their own paid up capital stock and surplus. They also lend funds (by "rediscounting") to these member banks upon approved security; and they have the right to issue paper money.

Director of the Budget. Another important administrative official acting under the President's direction is the Director of the Budget, also appointed by the President, but in this case without confirmation by the Senate and without any fixed term of office. In 1921 Congress passed the Budget and Accounting Act, providing for the preparation, by the Director of the Budget, of an estimate of the income and expenditures of the federal government for the coming year. This budget is transmitted to Congress for adoption, amendment or rejection; but Congress may also make appropriations outside of this budget. It should be noted in this connection that the President cannot veto any particular items in an appropriation bill and leave the rest standing. He must either accept or veto it as a whole. The result is that the veto power, so far as the spending of public money goes, is reduced almost to a nullity.

Independent Establishments. The federal government also has various independent establishments, such as the Government Printing Office, the Library of Congress and the Smithsonian Institution—an educational organization.

The Judiciary consists of the Supreme Court of the United States and such inferior courts as Congress may establish. All United States judges are appointed by the President, to hold their office during good behavior. Their salaries shall not be reduced during their term of office.

(1) The Supreme Court consists of the chief justice, whose salary is $20,500, and of eight associate justices with a salary of $20,000 each.

(2) Nine circuit courts of appeal have been established which consist of three judges each. Eligible to sit in this court are the Supreme Court justice assigned to the circuit, the circuit judges (of which there are two to four in each circuit), and the district judges within the circuit. The salaries are $12,500.

(3) The territory of the United States has been divided into some eighty-one judicial districts, none of them crossing state lines. There is usually one judge in each district; at times a judge is assigned to two districts, or more than one judge to one district. There are now 129 district judges. The salaries are $10,000.

A judge who is seventy years of age and has served ten years may retire on full pay for life.

(4) The United States courts have (also appointed by the President) district attorneys and marshals to prepare and prosecute cases in behalf of the government and to execute processes and other orders of the courts.

(5) The jurisdiction of the federal courts pertains to matters concerning the federal government, such as the post office, coinage laws, and so forth, and to cases which might involve the states or foreign countries.

(6) Also there is (a) the court of claims, before which come various claims (excepting pensions) against the United States, and (b) the customs court, which settles controversies arising in connection with the collection of our customs duties.

JUSTICES OF THE U. S. SUPREME COURT

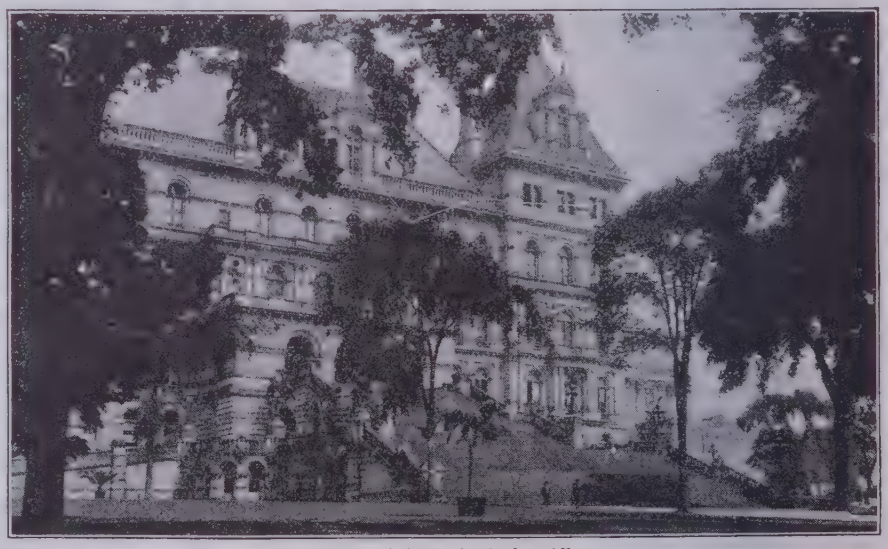
Bold face type denotes Chief Justices.

THE GOVERNMENT OF THE STATES

The original thirteen states, at the suggestion of the Continental Congress, each in its own way and time adopted a state constitution. It is customary of late years for the Congress to pass an act admitting a state under prescribed conditions of boundaries, population and so forth, with provision that it frame and adopt a constitution satisfactory to the Congress. These are all modeled in part after the Constitution of the United States and of the older states. Of late years there is a tendency to make them longer and to include in the constitution subjects formerly usually left to the legislature.

The State Capitol of Utah at Salt Lake City



The county, town and city governments are all under the control of the state; but the forms vary widely, usually there being a tendency, as regards the rural districts especially, to follow models of some of the older states as indicated in the brief historical introduction. Each local subdivision has, of course, some body with minor legislative or ordinance powers, an executive and a judiciary.

Legislatures. All the states have legislatures consisting of two houses. The members of the larger, or lower, house are elected from districts and meet in six states annually; in the others the legislature meets only biennially. Members of the upper house are usually chosen for a period of two or more years.

Salaries are paid to all but vary from annual salaries to a per diem for days actually served. In several states the sessions are limited in time to sixty or ninety days.

In most of the states there are restrictions upon the powers of the legislatures, such as prohibitions of special legislation, and limiting the borrowing power of cities. Provisions against corrupt lobbying, blackmail and other abuses are common. In the main, the laws that touch most closely our daily life, those regarding contracts, crimes, marriage and divorce, inheritance and so forth, are left to the states.

In about half the states provision is made for the initiation of laws by petition of a certain rather large percentage of the people; and also, by similar petition, the laws may be voted upon directly by the people, providing thus for the use of initiative and referendum. A still further movement for the expression of the will of the people is found in the recall, by which, at any time, on the submission of a petition signed by a certain percentage of the voters, the term of office of certain important officials may be terminated. Ten states now have this recall provision, and in one instance a governor has been removed by the voters using it.

The New York State Capitol at Albany

The Executive Department of the state consists of a governor, lieutenant-governor, secretary of state, auditor or controller, treasurer, attorney-general and others needed to carry out the laws. The terms and compensation vary in the different states. The most important difference between the state and federal executive departments is that in the states the other officers in most cases are elected and not appointed by the governor, so that there is not the unity of action that comes from an appointive cabinet. The tendency seems to be toward concentration of responsibility in the executive, so that in a number of states (New York for instance) the administrative posts, or most of them, are now filled by persons whom the governor appoints.

The Judiciary Department consists of a supreme court, and sometimes a court of appeals, and of such subordinate courts as the size of the state and the nature of its business and customs have made suitable. There are great similarities throughout the country. The judges are usually elected, and for terms of from two to fourteen years.

THE GOVERNMENT OF TERRITORIES AND DEPENDENCIES

The territories and the insular dependencies of Hawaii, Porto Rico and the Philippine Islands are under governments established by Congress and approved by the President and subject to change by regular legislative procedure.

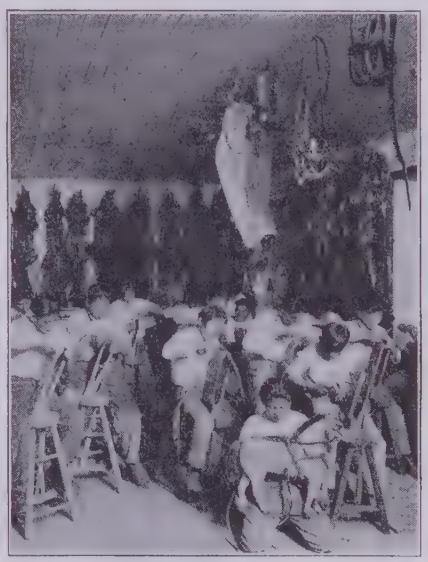
All have governors (appointed by the President with the approval of the Senate) and administrative and judicial officers (in part appointed by the President or by the Governor-General). Congress has granted these dependencies the powers to elect their legislative bodies for the making of new laws. In Hawaii, Porto Rico and the Philippine Islands there are two legislative houses, the Senate and House of Representatives, both of them elective excepting that in the Philippines the Governor-General appoints two Senators and nine Representatives to represent the non-Christian provinces. The Governor-General in these three territories may veto any act of the Legislature, but the latter may override this veto by a two-thirds vote. Under these circumstances, the question is referred to Washington, and the President of the United States decides it within six months in the case of the Philippines, and three months in the case of Porto Rico.

In event of a deadlock the revenue and appropriation laws of the preceding year continue in force. No new laws can be made without the assent of both houses. There seems to be an inclination to increase the powers of self-government of the territories and insular possessions as rapidly as the people, hitherto not accustomed to self-rule, shall show themselves fit to take it.

In the Philippine Islands, in 1928, there was established by former Governor-General Henry L. Stimson, a Council of State, which contains the members of his Cabinet, the President of the Senate and of the House of Representatives, and certain other leaders. This Council exists purely for discussion and advice. It takes no formal action that is binding upon anyone. It does, however, provide a means of close coöperation and mutual understanding between the Governor-General and the Filipino leaders. Also, in 1928, the Legislature of the Philippine Islands changed some of the restrictive laws regarding the investment of capital in the Islands, granted various franchises, and in this way began the improvement of the communication, light and power systems and other public utilities.

In all cases Congress retains under the constitution the right to modify to any extent the method of governing these territories and possessions. This applies also to the territory of Alaska and our other dependencies: Samoa, Guam, Panama Canal Zone and the Virgin Islands.

THE FEDERAL GOVERNMENT AND THE INDIANS



The relations of the Indians with the United States Government are controlled and directed by the Secretary of the Interior through the Commissioner of Indian Affairs. There are about 5,200 Government employees in the Indian Service, of whom about 2,000 are Indians. In twenty-six states 108 bonded superintendents discharge the duties of supervision and administration which formerly devolved upon Indian agents. Practically the entire Indian Service has been brought under Civil Service Regulations.

By the Act of June 2, 1924 (U. S. Code. Title 8, Chap. 1, Sec. 3), all Indians born within the territorial limits of the United States are declared to be citizens of the United States. The granting of citizenship to Indians does not in any manner affect the right of any Indian to tribal or other property.

Federal Agencies. In 1929 there were 337,652 Indians enrolled at eighty-two Federal agencies under the jurisdiction of the Indian Service. These agencies are located in twenty-five states. The definition of an Indian as employed by the Indian Service includes all persons enrolled with any tribe. In some cases, notably the Freedmen under the Five Civilized Tribes, Oklahoma, these persons are not of Indian blood. No information is available concerning the number of Indians not enumerated at Federal agencies. Therefore, no figures are available for the total Indian population of the United States.

There were reported during the fiscal year 1929, 83,262 Indian children eligible for school attendance. Of that number 34,288 were enrolled in public schools. In many districts financial assistance by the Government has been required, usually because of large areas of non-taxable Indian land located within the school district which make it impossible to raise by taxation amounts sufficient to conduct satisfactory schools. The rate paid for each day's attendance varies from about twenty cents to sixty cents, the average slightly above thirty-five cents. There was an attendance of 3,656 Indian children in mission, private and state schools and 24,969 children attended Government Indian schools.

Government Schools. There are three classes of Government schools maintained for Indian children: Day schools, of which there are about 130, located on or near the reservation close to the homes of the children, which are comparable to public schools maintained for white children; fifty-five reservation boarding schools on the reservations; and nineteen nonreservation boarding schools conveniently located near large centers of Indian population. The day schools carry grades one to four, or one to six, and usually furnish a noonday luncheon. The boarding schools generally carry the elementary grades only. Most of the nonreservation schools include elementary and junior high grades. Eight of these carry senior high school work. As to junior college work, arrangement is usually made whereby Indian students may remain at a Government boarding school in order that they may be entered and attend classes in a neighboring junior college. They are expected to perform a certain amount of labor to pay for their board, and must pay their own tuition and incidental expenses.

Making Harness

Indian boys making harness at the Sherman Institute, Riverside, California. The boy in front is working with a model.

Some provision is made for the education of the older Indians. Farm chapters are connected with many of the agencies and schools. In these the men and women of the community learn to work together and to carry on the work of home and community improvement. Groups of Indian women meet with the housekeepers of the various day schools and work at some handicraft. Sometimes this work affords some remuneration, in addition to its educational value. In many places state and school agricultural agents and home demonstration agents coöperate with farm chapters, boys' and girls' farm clubs and with schools. They help to better farming, gardening and home making.

At all Government Indian schools great stress is laid upon industrial education with a view to fitting boys and girls to become self-supporting citizens upon completion of their school days.

Several of the larger schools maintain an outing system under which boys and girls are placed in good white homes or on farms where they are under supervision of an outing matron or outing agent. Boys and girls are also placed under suitable supervision in homes where they have opportunity to attend public school, usually high school. Much benefit to the young people is reported from their stay as members of a good class of white homes while they attend school with the white children of the community.

Total appropriations for Indian education from public funds for the fiscal year 1930 amount to $8,002,000.

Area Reservations. The area of the Indian reservations in the United States and particularly in the western states has been considerably reduced during the past forty years. This has been brought about by various means.

The unallotted area within many of the reservations has been substantially reduced by the making of individual allotments to recognized members of the tribe occupying such reservations. In some cases, the Indians have ceded a part of their reservation to the Federal Government for a monetary consideration, and the land has been subsequently opened to settlement and entry under the public land laws. In other cases, the Indians have ceded and relinquished their lands to the Government for disposition under the public land laws and the net proceeds from the sale of such lands have been deposited in the United States Treasury and thus made available for the benefit of the Indians.

In 1909, the unallotted area of all Indian reservations in about twenty states was 48,477,796 acres (about 75,000 square miles). On June 30, 1929, the unallotted area in the same states was 31,837,316 acres (about 49,000 square miles).

The trust funds in the Treasury on July 1, 1929, to the credit of Indian tribes, amounted to $20,267,412 and the interest paid thereon by the Government for the fiscal year 1929 amounted to $673,649.07.

Contrary to the impression which is held by many people, not all Indians have land and a great many Indians take little interest in agriculture. On the other hand, most Indians display considerable mechanical ability and are successful artisans when well trained and placed in suitable industrial positions. An experience of more than one hundred years forces the conclusion that the civilization of the Indians will not be effected until changes are brought about in the isolation and customs of the remaining reservations and all Indians must live in close contact with the white communities. It is the policy, therefore, to seek employment for Indians away from the reservations and many have been placed in industrial employment.

PRESIDENTIAL ELECTIONS AND INAUGURATIONS

‡Prior to 1804 each elector was entitled to vote for two candidates for President. The candidate receiving the greatest number of votes was declared elected while the candidate receiving the next highest vote was declared Vice-President. †As there was no election the choice was decided by the House of Representatives. *It is claimed that the first Republican party was the progenitor of the present Democratic party. §Electoral votes not cast.

GOVERNMENT OF CANADA

THE Government of the Dominion of Canada (which comprises all of British North America except Newfoundland, Bermuda and the West Indies) is carried on by means of a *federal government* and a *federal parliament*, which deal with all affairs of the Dominion as distinguished from merely provincial affairs, the latter being dealt with by provincial or territorial governments in each of the nine provinces, the Yukon Territory and the North West Territories.

Source of Governmental Powers. All constitutional power and authority of the federal, provincial and territorial governments, legislatures and councils are derived from the Imperial Parliament of Great Britain; and the principal act by which the government of the Dominion and its various divisions is regulated, is known as the British North America Act of 1867. Canada, like the United States, has in effect a written constitution, but it is supplemented by certain unwritten conventions which are derived from the constitutional law and practice of the United Kingdom. Although the Imperial Parliament of Great Britain is the supreme legislative body for the whole empire, yet it has delegated the powers of self government to the Dominion and has ceased to legislate for it except insofar as it may be requested so to do.

Courtesy Canadian Pacific Railway Co.

Canadian Parliament Building

This view shows the imposing main building of the Canadian Parliament at Ottawa.

Limitations of Power. The statutes passed by the Canadian Parliament and legislatures must not exceed the legislative limits which the Imperial Parliament has laid down, or that may be judicially declared to be *ultra vires* (exceeding the authority) of the legislative body which has assumed to pass them.

EXECUTIVE DEPARTMENT

The Sovereign. The executive power of the entire empire is by law vested in a single person—the Sovereign. The crown is hereditary, and yet in the formal act of Recognition, still preserved in the coronation ceremony, the assent of the people is theoretically necessary. The right of inheritance may, and has been, changed by the Imperial Parliament, but subject to such change continues hereditary. The heir of the preceding Sovereign is the rightful successor. The preference of males to females and the right of primogeniture are strictly adhered to. Besides being heir to the preceding Sovereign, the successor must also be a Protestant.

How the Sovereign Acts. In the exercise of executive power the Sovereign acts upon the advice of the Ministers of the Crown, who are strictly accountable to Parliament for all public acts of the Sovereign. In Canada, as in all parts of the British Empire, all writs run in the Sovereign's name, and all crimes are charged to be "against the King's peace, his crown and dignity."

Term of Office. The Sovereign's term of office is during life, but in case of personal incapacity for the official duties of the office, by reason of infancy or other cause, a Regent may be appointed by Parliament.

Powers and Duties of the Sovereign. It is difficult within a short compass to specify all the powers and duties of the Sovereign, but among the more important are the following:

Commander-in-Chief of Army and Navy.
Communicates with Parliament verbally or by message.
Appoints Ministers of the Crown.
Approves or disapproves Acts of Parliament.
Makes treaties.
Has power to declare war and make peace.
Appoints public officers.
Grants reprieves and pardons for crimes.
Confers peerages and other honors.
Has supreme judicial authority in all causes and matters throughout the empire.

It is to be borne in mind, however, that in all these matters the Sovereign acts upon the advice of his responsible ministers. His judicial authority is exercised by what is known as the Judicial Committee of the Privy Council.

The Governor-General of Canada. *How Chosen.* The Governor-General is the Sovereign's representative in Canada, and is appointed by him upon the advice of the Canadian Government.

Term of Office. The term for which the Governor-General is appointed is usually five years, but may be extended or shortened by the Sovereign.

Eligibility. The person to be chosen must be a British subject, and is usually selected from the ranks of the statesmen of Great Britain.

Salary. The salary of the Governor-General is fixed by a Statute of the Dominion Parliament at £10,000, and is paid out of the Dominion exchequer.

Powers and Duties. The Governor-General is the representative of the Sovereign in Canada and acts for him in all governmental matters, upon the advice of the Canadian Ministry. The Governor-General also:

Communicates with Canadian Parliament verbally or by message.
Appoints Ministers of Canadian Government, who are able to command a majority vote of the House of Commons.
In the name of the Sovereign approves or disapproves of Acts of Parliament.
May reserve Acts of Parliament for consideration of the Sovereign.
May disallow Acts of Provincial Legislatures.
Appoints public officers of the Dominion.
Exercises Sovereign's prerogative of granting reprieves or pardons for crimes committed in Canada.

The Cabinet. This constitutes a kind of executive committee of Parliament. Its powers and duties are not defined by any statute or written law, but rest on conventions which have become part of the constitutional law of England, and of the various parts of the Empire to which powers of self-government have been delegated. It differs from the cabinet of the President of the United States in that it is considered essential that all its members shall be also members of one or other of the Houses of Parliament of Canada, where they shall be able to explain and defend all their acts and proceedings. The cabinet of the Dominion originates all legislation which it thinks to be necessary or expedient, and the defeat of any government measure of importance in the House of Commons generally necessitates the resignation of the Ministry, as no longer able to command the confidence of Parliament.

Salaries. The salary of the Prime Minister is fixed by Statute at $15,000 per annum. The salary of each of the other Ministers is $10,000 per annum. The Leader of the

Opposition also receives $10,000 per annum.

Privy Council of Canada. The statute law provides for the establishment of a Privy Council of the Sovereign in Canada, to aid and advise in the government of the Dominion. In practice the Privy Council as such does not govern, as it embraces men of different political parties who have been members of former cabinets.

The Executive Departments. The various executive departments of the Dominion Government are under the control of Ministers, who are members of the cabinet, who are appointed to office by the Governor-General, and who hold office during the pleasure of the Crown. The following are the Cabinet Portfolios, each corresponding to an executive Department. In some cases a Cabinet Minister has charge of several Departments.

The Prime Minister, usually fills the office of President of the Privy Council of Canada, and at the present time is also Secretary of State for External Affairs.

Minister of Justice and Attorney-General
Secretary of State
Minister of Finance and Receiver-General
Minister of Trade and Commerce
Minister of Marine
Postmaster-General
Minister of National Defence
Minister of Agriculture
Solicitor General
Minister of Public Works
Minister of Railways and Canals
Minister of the Interior
Minister of Mines
Minister of Customs and Excise
Minister of Labor
Minister of Fisheries
Minister of Immigration and Colonization and Superintendent-General of Indian Affairs
Minister of Health and Soldiers' Civil Re-establishment

LEGISLATIVE DEPARTMENTS

Parliament of Canada. The Parliament of Canada is composed of the Sovereign (represented by the Governor-General), the Senate and the House of Commons. It is the prerogative of the Sovereign to summon meetings of Parliament and to prorogue or dissolve it; also to approve or disapprove of all bills which have been agreed to by both houses. In each case he acts on the advice of his responsible ministers. The Governor-General takes no part in the debates. There must be a session of Parliament at least once in every year.

The Senate.

Number of Members, 96.

How Appointed. By the Governor-General on the advice of his Ministers.

Term of Office. Life, but office may be forfeited.

Eligibility. Thirty years of age or upward; British subject; owner of $4,000 realty; resident of the province he represents, and in the Province of Quebec his property qualification must be in the electoral district he represents.

Salary. Fixed by statute at $4,000 and traveling expenses; Speaker of Senate, $6,000.

Powers of Senate.

(a) Appoints its officers other than the Speaker, who is appointed and removed by the Governor-General in Council.

(b) Has power to approve, reject or amend bills passed by the House of Commons, except that it cannot originate, or alter bills passed by the House of Commons, for raising revenue.

House of Commons.

Number of Members, at present, 245.

How Elected. By popular vote for electoral districts, readjusted decennially.

Speaker. Elected by the House.

Salary. Fixed at $4,000 and traveling expenses, Speaker, $6,000.

Term of Office. Duration of Parliament, but may resign or be expelled for crime.

Duration. Until dissolved by the Governor-General, but not to exceed five years.

Powers.

(a) Originates all bills for raising revenue, and may originate bills of any other nature.

(b) Approves, rejects or amends bills passed by the Senate.

Legislation. All laws must receive the assent of the Governor-General, the Senate and the House of Commons.

Under the British North America Act certain legislative powers are assigned to the Provinces, and all other matters belong to the Federal Parliament. This principle, it will be observed, is the direct opposite of that of the American Constitution, under which all matters not specifically assigned to the Federal power, belong to the states.

JUDICIAL DEPARTMENT

Judges of Dominion Courts.

Supreme Court. Consists of a Chief Justice and six other justices.

How Appointed. By the Governor-General on advice of Canadian Cabinet.

Term of Office. Life and good behavior, but must retire on reaching the age of 75.

Jurisdiction. Appellate court to hear appeals from courts of last resort in the various provinces of the Dominion. Has original jurisdiction in certain constitutional matters. The only appeal from its decisions is to the Judicial Committee of the Imperial Privy Council.

Salary. Chief Justice, $15,000; other Judges, $12,000.

Exchequer Court. Consists of two Judges.

How Appointed. By the Governor-General upon the advice of the Canadian Cabinet.

Term of Office. Life and good behavior, but must retire on reaching the age of 75.

Jurisdiction. Claims against the Crown; federal railways; patents, trade-marks; copyright; admiralty cases.

Salary. President of Court, $10,000; other Judge, $9,000.

GOVERNORS-GENERAL OF CANADA

Governor-General	Lineage	Term of Office	Birth	Death
The Right Hon. Viscount Monck, G.C.M.G.	Charles Monck, British statesman, made a peer of the United Kingdom in 1866.	1867–1869	1819	1894
The Right Hon. Baron Lisgar, G.C.M.G.	Baron Lisgar, a British politician (Sir John Young)	1869–1872	1807	1876
The Right Hon. the Earl of Dufferin, K.P., K.C.B., G.C.M.G.	Was created Marquis of Dufferin in 1888 (Frederick Temple Hamilton Blackwood)	1872–1878	1826	1902
The Most Hon. the Marquis of Lorne, K.T., G.C.M.G., P.C.	Eldest son of the eighth Duke of Argyll (John George Henry Douglas Sutherland Campbell)	1878–1883	1845	1914
The Most Hon. the Marquis of Lansdowne, G.C.M.G.	Fifth Marquis of Landsdowne (Petty-Fitz Maurice Henry Charles Keith)	1883–1888	1845	
The Right Hon. Lord Stanley of Preston, G.C.B.	Sixteenth Earl of Derby (Frederick Arthur Stanley)	1888–1893	1841	1908
The Right Hon. the Earl of Aberdeen, K.T., G.C.M.G.	Seventh Earl of Aberdeen (John Campbell Hamilton Gordon)	1893–1898	1847	
The Right Hon. the Earl of Minto, G.C.M.G.	Fourth Earl of Minto (Gilbert John Elliot-Murray Kynynmound)	1898–1904	1845	1914
The Right Hon. the Earl Grey, G.C.M.G.	Fourth Earl Grey (Albert Henry George)	1904–1911	1851	1917
Field Marshal H.R.H. the Duke of Connaught, K.G.	Third son of Queen Victoria	1911–1916	1850	
The Duke of Devonshire, K.G., G.C.M.G.	Ninth Duke of Devonshire (Victor Christian William Cavendish)	1916–1921	1868	
Baron Byng of Vimy, G.C.B., G.C.M.G.	Seventh son of Earl of Stafford (Julian Hedworth George)	1921–1926	1862	
The Right Hon. Viscount Willingdon, G.C.S.I., G.C.M.G.	First Viscount Willingdon (Freeman Freeman-Thomas)	1926–1931	1866	
The Right Hon. the Earl of Bessborough.	Ninth Earl of Bessborough (Vere Brabazon Ponsonby)	1931–	1880	

PRIME MINISTERS OF CANADA

Name	Service		Born	Died
	Term	Years		
Right Hon. Sir John Alexander Macdonald, G.C.B., P.C.	1867–1873	6	1815	1891
Hon. Alexander Mackenzie	1873–1878	5	1822	1892
Right Hon. Sir John A. Macdonald, G.C.B., P.C.	1878–1891	13	1815	1891
Right Hon. Sir John Joseph Caldwell Abbott, K.C.M.G.	1891–1892	1	1821	1893
Right Hon. Sir John Sparrow David Thompson, K.C.M.G.	1892–1894	2	1844	1894
Hon. Sir Mackenzie Bowell, K.C.M.G.	1894–1896	2	1823	1917
Hon. Sir Charles Tupper, Bart.	1896–1896	6 mos.	1821	1915
Right Hon. Sir Wilfrid Laurier, G.C.M.G.	1896–1911	13	1841	1919
Right Hon. Sir Robert Laird Borden, G.C.M.G.	1911–1920	9	1854	
Right Hon. Arthur Meighen	1920–1921	1	1874	
Right Hon. William Lyon Mackenzie King	1921–1926	5	1874	
Right Hon. Arthur Meighen	1926–1926	2 mos.	1874	
Right Hon. William Lyon Mackenzie King	1926–1930	4	1874	
Right Hon. Richard B. Bennett	1930–		1870	

LAW

LAW may be defined as the system of rules established by organized society, performance of which it enforces, or breach of which it punishes. It is the coercive character of its rules that distinguishes law from custom.

THE HISTORY OF LAW

Law has a natural course of development among uncivilized people; and what are at first merely customary usages or arbitrary decrees of a despotic ruler, intended only for a single case, become fixed as rules of law. In early law, certain universal tendencies may be observed. Thus, such law is always formal. That is, the tests by which the validity of acts is judged are based on an arbitrary formality rather than upon the essential justice or reasonableness of the act. Procedure and proof are similarly formal. Such tests as ordeal or combat are held to determine the righteousness of a litigant's cause.

The Five Systems of Law. In the history of the modern world five great systems of law have grown up: The Chinese, the Hindu, the Mohammedan, the Roman and the English. Of these the two last named are peculiar in having spread far beyond the countries in which they had their origin, and these two systems at the present day mainly dominate the civilized world.

Roman Law was partially diffused over the countries which the Romans conquered, and later was either tacitly or expressly adopted by most of the European countries. It now prevails over all southeastern Europe as well as in Germany, Belgium and Holland, and to a large degree its principles have been adopted in the Scandinavian and the Slavonic countries. The settlers of Central and South America carried their law with them and the Roman law prevails throughout the countries there, as it also does in most of the East and West Indies.

A few portions of the British Empire and of the United States also have inherited the Roman law which, however, tends in such places with lapse of time to take on some admixture of the English common law. Scotland, parts of Africa, Ceylon, Quebec, Louisiana and the Philippine Islands come under this description.

The English Common Law has been spread by English colonists almost everywhere that the English language is spoken. Great Britain (with the exception of Scotland), Australia, New Zealand, British America (excepting the Province of Quebec), India, parts of Africa, numerous smaller British colonies, the United States, the Hawaiian Islands, all are dominated by the English system of jurisprudence, though in India native law as well as English law is enforced.

The English common law originated in local customary rules enforced in different communities in England. From these rules was gradually evolved a common law (that is, a universal or uniform law) for the whole kingdom. The earliest important influence in this direction was given by the establishment, in the reign of Henry II. of the Kings' Courts, which had jurisdiction over the whole kingdom and traveled on a circuit through the several shires. These courts gradually superseded petty local tribunals. In the reigns of Edward I and Edward III parliamentary enactments strengthened the tendency to uniformity already begun and the foundations of the modern law of real property were laid. Soon afterward the equity jurisdiction of the chancellor became recognized, by means of which extensive modifications have been evolved in modern English Law. The connection between the early lawyers and the church was very close, and by a body of canon law, based on portions of the Roman or civil law, the ecclesiastical courts controlled not a few legal questions, such as administering the estates of deceased persons. In other countries of Europe the canon law had been one of the means by which Roman law had been extended, and similar consequences might have followed in England were it not that in the reign of Henry VIII and shortly thereafter the destruction of the Papal power in England prevented the further development of civil law principles through the medium of the canon law and the church.

The great body of commercial law, which is so important today, has grown up, almost wholly since the beginning of the eighteenth century.

Foundations of American Law. When the English colonists settled in the United States they carried with them the system of law to which they had been accustomed and the Revolution, though it severed the political union between the United States and England, did not change the system of law; so that except as subsequent statutes or decisions of American courts may have led to a different result, English precedents still have weight in American courts.

The sources of both English and American law are two: (1) decisions of the courts and (2) statutes. It is an important rule of the English common law that a previous decision of a court on similar facts creates a precedent binding the same court, or other courts of equal or lower rank, to render the same decision on similar facts. It is due to this binding effect of precedent that definite rules of law gradually were evolved by the courts without the aid of legislative enactment. The rules thus established must be sought in the published decisions of the courts.

Statutes are another very important source of law. But even when legislatures pass statutes, courts have the power of deciding what they mean, and thus even in regard to statutory law the governing rules often cannot be clearly known until courts have decided cases involving the construction of the statutes.

CLASSIFICATION OF LAW

Law may be divided into public and private law. Public law involves rights and duties between the state, or one acting by its authority, and a private individual, while private law involves the relative rights and duties of private persons.

Public Law comprises (1) International law, (2) Constitutional law, (3) Administrative law and (4) Criminal law.

International Law consists of rules governing the conduct of states toward one another, and the conduct of citizens of one state toward those of another state. In disputes between nations there is no method by which parties can obtain a decree that will be forcibly carried out under the direction of a court; but the rules of international law are recognized by the courts of nations as binding when, as not infrequently happens, such rules affect the rights of individual persons.

Nations frequently agree to arbitrate their disputes, and there has been established an International Tribunal at the Hague to which subscribing nations agree to submit disputes; but awards under arbitration agreements or by the Hague Tribunal have only moral compulsion.

Constitutional Law defines the manner in which the government is carried on, and the limits of the powers of the state as against the individual. In the United States not only the general government has a written constitution, but each state likewise has such a constitution. Each of these constitutions establishes the method of government and also contains grants and limitations of power to the several departments of the state. The Federal Constitution gives certain powers to the national government and denies certain powers to the individual states. Except in so far as powers are granted expressly or by necessary implication to the national government, they are retained by the states. Both in federal and state constitutions the individual is protected in certain fundamental rights. Laws passed in violation of a constitution are void, and whenever they are involved will be so treated by courts having jurisdiction of the question.

Administrative Law relates to the rules by which government is administered by officers other than judges. Numerous rules affecting rights and duties are applied in this way: the collection of taxes and other revenue; the promotion of health by boards established for the purpose; the supervision of carriers, banks, insurance companies and other corporations; the management of public lands, are but a few of the activities which are carried on by administrative officers and in the exercise of these functions their rulings have a quasi-judicial character. This branch of law has greatly developed in recent years.

Criminal Law is the most familiar branch of public law. It consists of prohibitive rules to which penalties are attached. Criminal law, like other branches of law, grew up in England mainly by the decisions of courts creating a *common* law as distinguished from *statute* law. At the present time, however, criminal law has been more completely reduced to statutory form by legislative enactment than have the other branches. Within the limits of the Constitution the Congress of the United States has power to declare acts criminal and punish them as such, but there is no unwritten Federal criminal law and the determination of what are criminal offences and how they shall be punished are functions, for the most part, retained by the several states.

Private law controls the enforcement of

rights which may be divided into (1) rights *in rem*; (2) rights *in personam*. The former class of rights imposes correlative duties on everyone, while the latter class imposes correlative duties only on specified persons. The ownership of property affords an instance of a right *in rem*. The owner has a right to the property, and everyone else in the world is under a duty to refrain from interfering with it.

Certain fundamental personal rights also may be classed as rights *in rem*, since everyone is under a duty to each individual to refrain from interfering with these rights. Such interference constitutes what is called a *tort*, and, as such, gives a right of action for damages to the injured person and will frequently also constitute a crime and render the offender liable to prosecution by the state.

A more specific classification, convenient for the present treatment, divides rights under private law into those based on (1) status; (2) contract; (3) obligations imposed by law irrespective of agreement, which involve besides other rights a special consideration of (4) ownership of property.

STATUS

Certain rights and duties exist between parties who bear a certain relationship to one another. The most striking illustration is afforded by family relationship. Rights and duties of husband and wife, and of parent and child are created by the existence of those family relations, and are confined to persons bearing that relation to each other. The relation of master and servant involves at common law certain consequences, and other consequences are often added by statute.

CONTRACTS

Most of the ordinary transactions of business life involve applications of the law of contracts. The greater part of the law of agency, partnership, insurance, sales, negotiable paper and banking consists of specialized contractual law.

The simplest and also most accurate conception of a contract is a promise, or a number of promises, forming part of a single transaction, to which the law attaches legal obligation. Promises of competent parties may be binding because of their form or because of their essential character. Contracts of the first kind are called formal, of the second kind, informal or simple contracts.

Requisites of Contracts. Both formal and informal contracts may consist wholly of a promise or promises by one party only, or of mutual promises by the parties. In the former case the contract is called unilateral, in the latter case it is called bilateral. Both formal and informal contracts require that the parties undertaking to contract shall have capacity for that purpose. Both types also may be invalidated by being opposed to statute or public policy; or by being induced by fraud, duress, or essential mistake. These invalidating circumstances are considered later after the competency of parties and the essentials for the formation of informal or simple contracts are considered.

A contract is called a voidable contract when it may be avoided at the option of one of the parties. The term void contract, sometimes used for an agreement or promise having no legal effect, is a contradiction in terms. Being void, such an agreement is not a contract.

Incompetent Parties. Certain persons are more or less incompetent to make a valid contract. They may be divided into the following classes: (1) infants; (2) insane persons; (3) drunkards; (4) married women; (5) corporations.

Infants. At common law, all persons under twenty-one years of age are infants. In a few states, however, by statute, females are of age at eighteen.

An infant can bind himself for necessaries, but his other contracts are voidable by him. Necessaries consist of whatever, in view of his station in life, and his supplies from other sources, is essential for his welfare. An infant may avoid his contracts within a reasonable time after he comes of age, and if he has not received property which he still retains, his power of avoidance is generally not limited in time, but in some states an infant who has received property can never avoid obligations without returning what he has received. Even for necessaries an infant is liable only for their fair value. He is liable for his torts.

Insane Persons. Agreements of a person so insane as to be totally incapable of understanding what he is doing are generally void. If not insane to that degree, his contracts are generally voidable in the same way as the contracts of an infant. In some states, however, if an insane person not wholly devoid of reason has received fair consideration for his promise, and the person with whom he dealt had no knowledge of the insanity, the contract is held valid.

Drunkards are under no positive disability unless their intoxication is so great as to deprive them wholly of the use of their mental faculties. In that event they are dealt with like insane persons. The fact, however, that a person is slightly intoxicated may render him more easily a prey to fraudulent persons; thus drunkenness is often a relevant fact in determining whether a transaction was induced by fraud.

Married Women. At common law a married woman could not contract or acquire a contract right or other personal property or retain the ownership of such rights or personal property that she had at the time of her marriage. Courts of equity, however, from an early day, have protected her separate estate and recognized her contracts relative thereto. This estate included all property, both real and personal, which was settled upon her to her sole and separate use. The legal title to it had to be in some other person (who might be her husband), who held it in trust for her. The Married Women's Acts, which are in force in every state of the Union, have so far enlarged the rights and powers of married women, that they are generally either under no disability, or only given protection by being unable to contract with their husbands, or to become surety for them.

Corporations are created by the state, and have only the powers given them by their charters. They may make contracts, provided they act within the scope of their charters. Contracts attempted beyond that scope are *ultra vires* (exceeding legal power or authority).

Formal Contracts are of two kinds: (1) promises made as part of proceedings in court and (2) promises under seal. At common law the seal consisted of an impression on wax or a wafer attached to a written instrument. By statute, however, a mere scroll generally has the same effect as a common-law seal. By more comprehensive statutes, in some states seals are now wholly abolished, and in many other states if it is proved that there was not such consideration as is necessary for informal contracts, a promise under seal is not binding.

Informal or Simple Contracts depend for their validity upon a manifestation of mutual assent and sufficient consideration to support the promises of the parties. Informal contracts are at the present time of much the greatest importance everywhere, and in many states owing to the abolition of seals or a diminution of their legal effect, all contracts are informal.

Mutual Assent. Expression of assent to a contract, as a practical matter, can be secured only by an offer by one person and acceptance by the person to whom the offer is made. An offer to contract is a promise, in terms conditional on there being given in exchange for it another promise or some specified performance. Giving such other promise or performance is itself a manifestation of acceptance. Before such acceptance takes places, however, and making any subsequent acceptance ineffective, an offer may be terminated: (1) by revocation by the offeror; (2) by rejection by the offeree; (3) by death or insanity of either party; (4) by lapse of an unreasonable time for acceptance. An offer may be made not simply by spoken or written words, but by acts manifesting the offeree's intention, or by both words and acts. Thus an order given to a shopkeeper implies a promise to pay for the goods requested, if they are furnished.

An offer can be accepted only by the person to whom it is addressed. The method of accepting an offer for a unilateral contract is by doing the act requested in the offer. An offer for a bilateral contract is accepted by giving the promise that the offeror requested. The offeror may impose any conditions in his offer that he sees fit, and in order to form a contract the offeree must always comply with these conditions. When an offer is made by mail, an acceptance by mail, if properly addressed and stamped, takes effect, when posted. The fact that it is lost in the mail is immaterial. The offeror, however, may make actual receipt of the letter of acceptance a condition of his offer. The rule in regard to acceptance by telegraph is the same as in the case of acceptance by post. Use of the mail or telegraph must, however, have been expressly or impliedly authorized by the offeror, in order to make the mere despatch of a letter or telegram a valid acceptance. Use of that means in communicating the offer or general custom may give, by implication, the requisite authority.

Like an offer, acceptance may be indicated by acts as well as by words. A contract is called an express contract where the parties' assent is manifested by oral or written words. An implied contract is one where assent is

inferred from the acts of the parties. Obligations to pay for benefits received, though not created by any manifestation of assent, are also sometimes called implied contracts, but are better called quasi contracts.

Consideration. Consideration means an exchange given for a promise. In order to support a promise there must be something given in exchange for it, and the exchange must be such as the law requires. Therefore, a promise to make a gift is not enforceable, though an actual gift accompanied with delivery of chattel property is effectual, since the donee then relies on possession of the chattel, not on a promise. Consideration for a unilateral contract is legally sufficient if it is anything which the promisee was not previously under a legal obligation to do or give, and a *promise* of any such thing is sufficient consideration for a bilateral contract. Payment of all or part of an admitted debt, or a promise of such payment is, therefore, insufficient consideration for a promise by the creditor. A promise, though conditional on the happening of an event which may never occur (such as a promise to pay money if a house burns) is, however, sufficient consideration for another promise. It is also immaterial that consideration for a promise is of little or no pecuniary value so long as the offeror requested it, and the offeree was not bound to give it.

Promises Binding Without Assent or Consideration

There are very few promises which are binding without any acceptance by the promisee, and without any consideration. Such are promises to pay a debt of the promisor, recovery of which has been barred by the Statute of Limitations or by discharge in bankruptcy.

Necessity of Writing. An early English statute, called the Statute of Frauds, required certain contracts to be in writing, or a written memorandum to be made signed by the party to be charged, stating the terms of the contract, in order that such contracts should be enforceable. This statute has been substantially reënacted in all the United States. The contracts that are thus required to be in writing are the following: (1) contracts by an executor or an administrator to pay damages out of his own estate; (2) contracts to answer for the debt or default of another; (3) contracts in consideration of marriage, that is, contracts for marriage settlements; (4) contracts for the sale of any interest in land; (5) contracts which can not be performed within a year from their formation; certain other contracts also under the statutes of most American states, require a writing; (6) promises to pay an antecedent debt that otherwise would be barred by the Statute of Limitations; (7) promises to accept a bill of exchange.

In some states also a writing is necessary to make enforceable promises: (1) to revive a debt barred by a discharge in bankruptcy; (2) to make a will or leave a legacy; (3) to authorize an agent for some purposes; (4) to pay commissions to real estate brokers.

Under the English statute, a written memorandum signed by the party to be charged was also required to make enforceable sales and contracts to sell chattels exceeding £10 in value, if no part of the goods were accepted and actually received by the buyer, and no earnest money or part of the price paid by him. There were thus alternative methods besides a written memorandum for making such transactions enforceable. About three fourths of the United States have enacted a similar statute, but in these states the minimum amount necessary to bring the transaction within the statute varies greatly. In Ohio it is $2,500. In no other state is it higher than $500, the figure adopted in a number of States. In others it is $50.

Illegal Contracts. An agreement to do an act which is prohibited by positive law, or which is against public policy is illegal and cannot be enforced by a party who knew the facts making the agreement illegal. A party who has no reason to know such facts may, however, recover damages for breach of an illegal contract. Thus if a married man engages himself to an unmarried woman who does not know he is already married, she can maintain an action for breach of promise.

Wagering Contracts. In this country wagering contracts are not enforceable. They include not only ordinary bets but speculative transactions where the parties do not contemplate a delivery of goods or shares of stock bought or sold, but merely payment of the difference between the contract price and a subsequent market price.

Sunday Contracts. Sunday contracts, as a rule, are prohibited by statute. At common law, however, they were enforceable. The statutes of the various states vary considerably, but all exempt from their operation contracts founded upon works of charity or necessity. Under these statutes, contracts, not within this exemption, are illegal. Formal contracts and negotiable instruments take effect on delivery. Therefore, bills of exchange, promissory notes, bonds, deeds and mortgages delivered on Sunday are illegal although signed on a secular day. But those delivered on a secular day are enforceable although signed on Sunday. An informal contract takes effect on acceptance of an offer. Therefore if an offer is made on Saturday and the acceptance is given on Sunday, the transaction is invalid; but an acceptance on Monday of an offer made on Sunday creates a valid contract.

Usury Statutes. Usury statutes obtain in nearly all of the states. Usury is interest contracted for or paid in excess of the legal rate. The purpose of the usury statutes is to protect debtors from over-reaching creditors. They vary in the different states. A few make the entire contract void. Others make the interest void. Still others merely make the excess above the legal rate void. They apply to loans, but not to sales. Hence they are not applicable where bills or notes are discounted by a third party. Nor, by the law merchant, do they apply where a banker in loaning money, deducts in advance the highest rate of interest allowable. Devices to cover an intent to obtain usury by commissions, or bonuses are carefully scrutinized by the courts.

Contracts in Restraint of Marriage. Contracts which unduly restrain a person from marrying are against policy and void. Thus, a contract never to marry, or not to marry any one but a certain person to whom the promisor is not already engaged, is void. But a contract not to marry until of age, is valid. And, ordinarily, a contract not to marry without the consent of the promisor's parents is valid.

Contracts facilitating divorce or separation of married couples are illegal, though after actual separation a contract fixing the amount of settlement is valid.

Contracts in Restraint of Trade. From early times contracts unreasonably restraining employees whose employment had terminated, from exercising their skill, were held to be illegal. A restraint was unreasonable which exceeded what was necessary for the protection of the promisee, as where it would prohibit exercise of the promisor's occupation in territory beyond the scope of the promisee's business. This is still law both in England and in the United States; and a similar rule invalidates contracts prohibiting competitors in a business or profession from exercising that business or profession, beyond the extent necessary for the protection of the business purchased. The prohibition of contracts in restraint of trade has been extended, especially in the United States, to all contracts, the tendency of which is to obtain a substantial monopoly, and statutes have been passed both by the Federal Government (The Sherman Law) and by many states making any transaction, whether by contract or by actual combination, illegal, and in many cases criminal.

Contracts Obstructing Justice. Contracts by which a lawyer or other person undertakes to pay the expense of litigation and to receive in return a share of the proceeds of the litigation are generally, though not universally, held illegal. Contracts to refrain from prosecuting or disclosing a criminal offense are also illegal. An injured person may refrain from prosecuting, but he may not bargain for consideration for so doing.

Contracts Tending to Political or Business Corruption. Lobbying contracts are illegal though contracts to argue in favor of legislation before legislative committees are valid. Contracts for procuring public contracts or for the appointment or compensation of officials, or for procuring pardons, or for the location of public buildings are also illegal, as are contracts to secure the election to office in a private corporation, or contracts of agents or other fiduciaries for secret commissions or for any purpose which tends to impair fidelity.

Miscellaneous Illegal Contracts. Contracts with alien enemies are forbidden. Contracts already existing with them are suspended if involving merely unilateral obligations to pay money or transfer property; but existing contracts which would require continued exchange of performance during war are wholly avoided. Contracts to promote illegal acts or to indemnify one who performs them are prohibited. However, mere knowledge by a seller that the buyer intends to use goods purchased for an illegal purpose does not generally preclude recovery of the price. Revenue statutes and licensing statutes also may make contracts illegal.

Rules of Interpretation. The ultimate purpose of rules of interpretation of contracts is to ascertain their meaning, which often is not clearly expressed. To accom-

plish this the following rules are applied by the courts:

When the contract is in writing, its purport cannot be contradicted or varied by proof of oral agreements or conversations. This rule does not apply, however, where the writing is a mere memorandum of the contract, or where the purpose in introducing oral testimony is to show fraud, illegality, mistake of expression, usage or custom, or a condition precedent to the writing becoming effective. Nor does it apply to subsequent oral agreements. Nor to oral testimony whose purpose is to explain, not contradict, the meaning of terms.

When the instrument is partly written and partly printed and the written and the printed parts conflict, the writing controls.

In both oral and written contracts, words are given their plain, common meaning. If, however, the context or surrounding circumstances show that the parties intended to use them in a peculiar or technical sense they are given that special meaning.

When doubt exists as to the meaning of a word or clause it is construed most strongly against the party using it.

When words or clauses are repugnant, those which are opposed to the manifest intention of the parties are rejected.

Subsequent acts of the parties may have a controlling influence in determining the meaning of their agreement. In no case, however, will they be allowed to defeat the plain import of their words.

The various parts of the instrument must be construed together. When there are several contemporaneous agreements relating to the same transaction they must be construed in the light of one another. And when one or more other papers are directly referred to in the instrument as constituting an inducement to the contract, they are entitled to consideration.

Mistake. Where parties to a contract bargain on the assumption that an essential fact exists and it does not, the contract is voidable. The mistake must be mutual and relate to a vital fact, assumed as a basis of the bargain.

Misrepresentation, as distinguished from fraud, is an innocent misstatement or non-disclosure of a fact. Though formerly this had no effect on a contract, the prevailing tendency is now to treat it as ground for avoiding a contract. Mere non-disclosure, however, does not ordinarily have this consequence. There are, however, some exceptions to this rule. Where one party justifiably relies upon the other party for knowledge of certain facts that other party in consequence is bound to exercise the utmost good faith.

Such contracts are insurance contracts, and those made between parties occupying a fiduciary relation, such as guardian and ward, trustee and *cestui que trust*, attorney and client, principal and agent, etc.

Fraud is a misrepresentation of a material fact, present or past, made with knowledge of its falsity or in reckless disregard whether it is true or false, which deceives the other party, to his injury.

Ordinarily, to constitute fraud there must be a misrepresentation as distinguished from a mere non-disclosure. There are, however, some exceptions to this rule. Where the deceiving party is in duty bound to make a disclosure, or where he takes steps to prevent a disclosure, or where the concealment renders that which is stated false, the non-disclosure amounts to fraud. The effect of fraud upon a contract is to make it voidable at the option of the injured party.

Duress is actual or threatened violence or imprisonment which reasonably causes another to enter into a contract. It may be by one of the parties to the contract or by his agent. And it may be directed against either the other party to the contract, or his or her spouse or other near relative. It may consist of the threatened destruction of property, or, under oppressive circumstances, of the illegal detention of property. Its effect is to render the contract voidable.

Undue Influence. Undue influence is akin to duress. It consists in the taking by one of the parties to the contract of an unfair advantage over the other party, who either reposes confidence in him, or possesses a weak intellect, or is in distress. Like fraud, its effect upon a contract is to render it voidable.

Modes of Discharging a Contract. Contracts are discharged: (1) by agreement; (2) by performance; (3) by impossibility of performance; (4) by breach; (5) by operation of law in a few less common ways.

Discharge by Agreement. The parties may agree that their contract shall no longer bind them. Such an agreement is called a waiver, cancellation or rescission. Express words of rescission are not essential. Thus, where the parties make a new contract which is inconsistent with the old one, the latter is discharged. In such case if a third party is substituted for one of the original parties with the consent of all three, the new agreement is called a novation. A unilateral obligation, however, cannot be discharged by mere agreement. The same requirement of sufficient consideration for creating an unsealed contract exists for discharging contractual rights as for creating them. Where both parties are under an obligation the mere agreement of each to surrender his rights is enough.

Discharge by Performance. Strict and full performance of a contract discharges it.

Performance may consist in payment of money or negotiable paper. In the latter case the performance may be absolute or conditional. Ordinarily, a presumption arises that the payee is entitled to sue on the original contract if the paper is not paid when due.

Rejection of tender, or of an offer to perform, may constitute a release. Thus, when a party offers to render services, or deliver goods, or do some other act which he is bound to perform, and the tender is definitely refused, he is released if the contract is bilateral.

If, however, there is merely a unilateral obligation to pay money or render some other performance capable of subsequent fulfillment, a tender of what is due does not discharge the debt. Usually, however, it stops the accrual of interest, and also puts the burden of costs on the creditor in case he sues to recover the debt. Moreover, if any security for the debt exists, it discharges it.

Discharge by Impossibility of Performance. When impossibility of performance arises subsequently to the formation of the contract it does not discharge it in every case. It does, however, (1) when the contract is one for personal services, and death or incapacitating illness supervenes; (2) when the continued existence of some specific thing or means of performance is essential to the performance, and it ceases to exist through no fault of either party; (3) when the impossibility is created by domestic law; (4) in a few recent cases it has been held that a change in facts that were understood to be a basic assumption in the formation of the contract, entirely frustrating the object or value of performance of the contract, discharges it.

Discharge by Breach. Breach of the contract by one of the parties always gives the other party a right of action for damages, and if it is a material breach, and the injured party so elects, it discharges the contract.

Other Methods of Discharge by Operation of Law. Contracts are discharged by operation of law: (1) by merger; (2) by cancellation or destruction of a formal contract; (3) by alteration. Remedies under a contract may also be barred by a discharge in bankruptcy or by the statute of limitations.

Merger is where a higher security swallows up or extinguishes a lower one. This cannot occur unless the securities are of unequal grade, and the subject-matter and the parties the same. A contract under seal will merge a simple contract, and a judgment will merge a contract under seal. But a written contract not under seal will not merge an oral one because they are of equal grade. Each is merely a simple contract.

Cancellation or Destruction of a formal unilateral contract if done intentionally by the promisee discharges it.

Alteration of a written contract discharges it, provided the alteration is material and made fraudulently and intentionally by one of the parties to it, or his agent, without the consent of the other party.

NEGOTIABLE INSTRUMENTS

Assignment of an ordinary contract does not fully substitute for the original contract a new one with the assignor. Negotiability gives substantially this effect. Negotiable paper possesses the following characteristics: (1) it must be in writing and signed; (2) it must contain an unconditional order or promise to pay a certain sum of money; (3) it must be payable to order or bearer; (4) it must be payable at a determinable time; (5) if it is an order it must indicate the drawee.

Bills of Exchange. A bill of exchange is an unconditional written order by one person upon another, directing him to pay to a third party, or to his order or to bearer, a sum of money therein stated.

Bills of exchange are of two kinds: (1) foreign; (2) domestic. A foreign bill of exchange is a bill drawn in one state or country and payable in another state or country. A domestic or inland bill of exchange is a bill which is payable in the state or country in which it is drawn.

The necessary parties to a bill of exchange are the drawer, the drawee and the payee. There may be, in addition, indorsers and indorsees. After the drawer accepts the bill he is called the acceptor. In accepting the

bill he thereby becomes the party primarily liable.

Unless the drawer has directed that presentment be made for acceptance it is not essential in the case of bills payable on demand, or on a certain date, to present them for acceptance. It is customary to do so, however, with those payable at a specified time. Those payable a certain number of days after sight or demand must be presented for acceptance within a reasonable time.

The drawee is entitled to inspect the bill, and to refrain from acting for twenty-four hours. This is to enable him to investigate the drawer's account before deciding whether he will accept the bill or not.

An acceptance which differs from the tenor of the bill may be refused by the holder; but if he consents to receive it, he can have no greater right. .

Promissory Notes. A negotiable promissory note is an unconditional written promise by one person to pay to another person, or to his order or to bearer, at a determinable time, a sum in money. The liability of the maker, unlike that of the drawer of a bill of exchange, is primary and unconditional.

Negotiation. A bill or note payable to bearer, or payable to order and indorsed in blank, is transferable thereafter by mere delivery. The transferor in such case impliedly warrants the genuineness of the signatures and the body of the instrument. He also impliedly warrants the capacity of the parties to make a contract and his title to the instrument.

When the instrument is payable to order and has not been indorsed, or when it has been specially indorsed by naming the indorsee, any further transfer will require the indorsement of the indorsee. Without such indorsement the equitable title will pass, but not the legal title.

Indorser. An indorser of a bill or note not only impliedly warrants all that a transferor by mere delivery impliedly warrants, but also, in the case of an unaccepted bill payable at a certain future time, that it will be accepted unconditionally by the drawee when duly presented for acceptance; and in the case of a promissory note or an accepted bill payable at a certain future time, that it will be paid at maturity if duly presented for payment, or, if payable on demand, that it will be paid when demand of payment is made, if that demand is made within a reasonable time. And furthermore, that in case of dishonor, either by non-acceptance or non-payment after due demand, he will pay the obligation if due notice of the dishonor is sent to him.

Where there are two or more indorsers they are liable *prima facie* in the order in which their names appear on the instrument.

A drawer of a bill or indorser of a bill or note is not liable unless the instrument is on presentment to the drawee or maker at maturity dishonored by him and prompt notice of the dishonor sent. Notice of dishonor may be oral. Ordinarily, however, it is in writing. It should contain statements showing: (1) a sufficient description of the instrument dishonored; (2) that it was presented for acceptance or payment; (3) that acceptance or payment was refused; (4) that it has been protested, if protest is necessary; (5) that the holder looks for payment to the party notified.

Protesting a bill or note consists in taking the necessary formal steps by a notary public to establish and certify to its dishonor. It is essential that the same notary take all the steps required and that the certificate of protest be based upon his acts.

Protest is necessary only in case of bills or notes made in one state or country and payable in another. Presentment, notice, and protest may be waived. Sometimes the waiver is written with an indorsement. Even after failure of the holder to exercise the required diligence to charge a drawer, or indorser a promise by him to waive the deficiency is effective.

A restrictive indorsement is one which restrains further indorsement of the bill or note. Title is vested in the indorsee as a trustee or agent. Thus, "Pay to John Brown for my use," or "Pay to John Doe for my account," are restrictive indorsements.

Checks. A check is a bill of exchange, addressed to a bank or banker, payable on demand.

A checkholder, as a rule, may not sue the bank. The bank's duty is to the depositor, and it will be liable to him for failing to pay a properly drawn check when there are funds. If, however, the check has been previously certified by an authorized officer of the bank, it operates as an acceptance and the bank becomes liable to the holder. Moreover, where the holder of the check procures the certification, the drawer and the indorsers are released.

A check should be presented within a reasonable time. What constitutes a reasonable time depends upon the circumstances of the particular case. If because of neglect to present within a reasonable time, the drawer would suffer, as where the bank fails, the drawer is discharged to the extent of the injury suffered. One who takes an overdue check, like one who takes any overdue bill or note, is subject to equitable defenses of the maker.

When the fund of a depositor is attached, the bank, as a rule, may not pay his checks, unless they have been certified before the attachment.

When a bank pays to a holder in due course a check whose signature is forged it must bear the loss. And when it pays a raised check to such a holder, it also must bear the loss, unless the drawer's negligence in making out the check facilitated the forgery.

Certificates of Deposit are promissory notes issued by banks in return for deposits.

Holders in due course of negotiable paper are persons who take it in good faith, without notice of equities in the usual course of business, for a valuable consideration, before maturity.

As a rule, such a holder of negotiable paper takes it free from all equities. Negotiable paper is endowed with the capacity for transfer, and it is not the purpose of the law that, when passing from hand to hand, its origin shall be scrutinized at the peril of non-payment. Otherwise its valuable quality is impaired or lost. The requirement is that the transfer shall be made with honest intent and belief by the purchaser that the paper is the evidence of an honest indebtedness. To constitute notice of an infirmity in the instrument or defect in the title of the person negotiating the same, the person to whom it is negotiated must have had actual knowledge of the infirmity or defect or knowledge of such facts that his action in taking the instrument amounted to bad faith.

AGENCY

An agent is one who represents and acts for another who is called his principal. Agency is the relation which exists between such persons. The relation of agency may be created by agreement or by operation of law.

Creation by Agreement may be by appointment or by ratification. Ratification is the adoption of the act of an unauthorized agent. To create the agency relation by ratification, the following conditions must exist: (1) the doer of the act must profess to do it on behalf of an existing principal; (2) the approval of the act must be given with full knowledge of all the facts; (3) the act must be approved as a whole. It may not be approved in part and repudiated in part.

Creation by Operation of Law. As a rule, the agency relation is created by agreement of the parties. There are, however, two important exceptions to this rule: (1) agency by estoppel or apparent authority; (2) agency by necessity. In these cases there is no assent of the parties. The relation is created by operation of law.

In the case of agency by estoppel the principal, by his act, estops himself from disputing the agency. As said by an eminent judge, "Where one has so acted, as from his conduct to lead another to believe he has appointed some one to act on that belief, then, unless he interposes, he will, in general, be estopped from disputing the agency, though in fact no agency really existed."

A good example of agency by necessity is that which arises where a husband improperly fails to furnish his wife necessaries. In this case, as said by Chief Justice Holmes, "it (the law) creates a compulsory agency."

Agents. Agents are classified as to the scope of their authority and also as to the nature of their duties.

As to scope of authority, agents are either general or special. A general agent is one who is appointed to do acts of a class, and a special agent is one appointed to do an individual act.

As to the nature of their duties, agents are either professional or non-professional. The former include brokers, factors, or commission merchants, auctioneers and attorneys-at-law.

Capacity of the Parties. Any person who has legal capacity to act in his own right may act through an agent. And any person who has sufficient natural capacity to perform the act delegated to him may be an agent.

Appointment of Agents. Ordinarily, an agent may be appointed orally. In some cases, however, by statute, a writing is essential. At common law, to empower an agent to bind his principal by an instrument under seal, the agent's authority must be under seal. At present, however, as has been previously said, seals have been abolished in many states and even where they still have force the rule is subject to the following exceptions: (1) where the instrument is

sealed in the presence of the principal, by his authority; (2) where the instrument does not require a seal for its validity.

Duties and Liabilities of Agents. An agent must be loyal to his trust and obey instructions. He must not engage in enterprises antagonistic to the interest of his principal nor reap secret benefits at the expense of his principal. He must exercise due care and skill and keep regular accounts of his transactions connected with the agency. If he exceeds his authority as agent he is liable to a third party with whom he deals as well as to his principal. And in all cases he is liable to third parties injured by his torts, who are not themselves guilty of contributory negligence.

Rights of Agents. An agent is entitled to the compensation agreed upon, or to reasonable compensation where no sum is fixed by agreement. If the term is fixed, and he is wrongfully discharged, he has the option of treating the contract as rescinded and recovering the actual value of the services rendered, or of treating the contract as subsisting and recovering damages for the breach. If he should decide to do the latter, it is wiser to wait until the end of the term, since the damages are otherwise uncertain.

Liabilities of Principal. Besides the duties to the agent involved in the preceding statement of the agent's rights, it is the duty of the principal to give instructions to his agent as to the duties he is to perform, to furnish him with proper appliances, and so forth. The acts of the agent, within the scope of the agency, are the acts of the principal, and he is liable to third persons for them.

Termination of the Agency Relation. The agency relation may be terminated as follows: (1) by act of the parties; (2) by expiration of the term; (3) by operation of law.

(1) The parties may terminate the relation at any time, by mutual agreement. Moreover, as a rule, either party has the actual power to renounce the agency at any time. In doing so, however, he is liable in damages for breach of his contract. The only exception to this rule is where the agent's authority is coupled with a proprietary interest in the subject-matter of the agency. In such case the principal cannot renounce the agency.

(2) When the agency is created for a definite period it expires at the end of the term.

(3) The chief causes by which the agency relation may be terminated by operation of law are the following: death, insanity, bankruptcy, war and marriage. There are certain types of agency, such as a power coupled with an interest, which are not terminated even by the death of the agent so interested.

CORPORATIONS

A business corporation, from a strictly legal point of view, is an artificial person created by law, distinct from its members. Practically, however, it is an association of natural persons endowed with power by the legislature to carry on business enterprises in many respects as an individual.

How Corporations are Created. In this country they are created by the legislature, and as a rule under general statutes. Under these statutes the charter of the corporation consists of the certificate of incorporation, the articles of association, and the statutory provisions.

Corporate Attributes and Powers. As a legal entity, a business corporation has capacity, within the limits fixed by its charter, to exercise the legal functions of a natural person.

Corporate Management. The ultimate power in a corporation rests in its members. In a business corporation they are the stockholders. They choose a board of directors, and this board is entrusted with the direct management of the business. For carrying out this work usually, a president, secretary and treasurer, are chosen by the board. By-laws established by the corporation on its formation, with subsequent amendments, fix the duties of officers and other details.

Each stockholder is usually entitled to one vote for each share of stock owned, and he is permitted to cumulate them as he chooses. He may also vote by proxy. But voting power is often restricted in the charter to a special class or classes of stockholders.

The board of directors usually has a wide discretion in the management of the business. It has sole power to declare dividends and to fix the time and place of payment. As a rule, the majority of the directors constitute a quorum. The board has authority to select agents of the corporation, but not to decide upon important changes in the company's business, nor to determine whether the business shall be wound up or not.

Liability of Shareholders. As a rule, the shareholders whose subscriptions are fully paid are not liable to the creditors of the corporation. But by statute in various cases where they participate in the wrongful diversion of the capital of the corporation to the injury of its creditors they are liable to them. Shareholders in national banks are liable, on insolvency of the bank, to pay toward its indebtedness an amount equal to the par value of their stock.

Modes of Dissolving a Corporation. A corporation may be dissolved in any one of the following ways: (1) by expiration of its charter; (2) by surrender of its charter with the consent of the state; (3) by legislative enactment, provided it is constitutional; (4) by judicial proceedings for the purpose of forfeiture owing to misuser or nonuser of its franchises.

PARTNERSHIPS

A partnership is an unincorporated association of two or more competent persons who have agreed to unite their property, labor and skill, or some of them, in carrying on a lawful business as principals for their joint profit.

The requisites of a partnership are as follows: An agreement by two or more competent persons to carry on a lawful business as principals for pecuniary gain. The contract need not be in writing unless its terms bring it within the Statute of Frauds.

Classification of Partnerships. Partnerships are sometimes classified as ordinary partnerships, limited partnerships and joint-stock companies.

Ordinary partnerships are divided into general and special partnerships.

A general partnership is one for carrying on a general kind of business or several kinds of business. A special partnership is one created to accomplish a single adventure.

A limited partnership, allowed by statute in a few states, is one having one or more general partners whose liability for the firm debts is not limited, and one or more special partners whose liability is limited. In organizing this kind of partnership the provisions of the statute must be carefully followed.

Joint-stock Companies are partnerships with a capital stock divided into transferable shares. In the absence of statutory provisions they are governed by the articles of association, the by-laws, and the general principles of partnership.

Classification of Partners. Partners are designated according to the relation that exists between them and the firm, or between them and third persons. Thus, depending upon such relation, they are called ostensible, active, secret, dormant, nominal, general, special, incoming, retiring or liquidating.

Powers of Partners. As a general rule, each partner, for the purposes of the partnership business, is an agent of the firm and of his copartners. The extent of the agency depends upon the nature of the business. In a trading firm a partner has implied power to buy and sell goods, execute commercial paper, borrow money, pledge or mortgage firm personalty, collect debts due the firm, lease premises, hire property, appoint agents, etc. He has no implied power, however, to submit controverted partnership matters to arbitration, or make a general assignment for the benefit of creditors.

In the case of a non-trading firm the implied powers of a partner are more limited. Thus, he has no implied power to bind the firm by making, accepting or indorsing commercial paper. Such paper, therefore, is not enforceable even in the hands of a *bona fide* purchaser.

Rights and Duties of Partners to One Another. Each partner, in the absence of an agreement to the contrary, has an equal right to share in the management of the business of the firm. And each has the right to have firm property applied to the payment of firm debts.

The partnership relation is one of great confidence and trust. For this reason the law requires that partners exercise toward one another the highest integrity and good faith. In the absence of agreement, a partner must not engage in transactions antagonistic to the firm's business, or take secret profits at the expense of the firm. He must conform to the partnership agreement, keep accounts, exercise care and skill, and consult with his copartners upon all proper occasions.

Liability of Partners. Partnership obligations arising from contract are joint, while those arising from tort are joint and several. Each member of the firm is personally liable, however, for all the firm debts. But a partner who is compelled to pay firm debts out of his separate estate is entitled to credit for the payment in an accounting with his copartners.

Partnership Property. The property of the firm may be both real and personal. The legal title to the firm personalty may be held in the firm name. This is sometimes allowed by statute also as to the firm realty; but apart from statute it is not possible, and

even though permitted it is not wise. This is owing to the fact that the firm is not a separate legal entity. The deed should run to all of the partners in trust for the firm. It may be held by any one, however, for the use of the firm. The interest of a partner in the firm property is a peculiar one. It is simply his share in the surplus after the debts are paid. And this is all the buyer gets where a partner's interest is sold by a separate creditor under a writ of execution.

Actions in Law and Equity. Since the firm is not a separate legal entity, a partner cannot sue his firm at law. Nor can the firm sue him. Moreover, a partner cannot sue his copartner at law except as to transactions wholly distinct from the partnership business; and also as to matters arising prior or subsequent to the partnership, and which, though connected with it, are not partnership transactions. Thus, a partner may sue his copartner at law for breach of his agreement to enter into the partnership relation, to furnish capital, pay debts, indemnify him for expenses paid, or reimburse him for capital advanced.

Dissolution of the Firm. The partnership relation may be terminated either (1) by act of the parties, or (2) by operation of law.

By act of the parties it may be by original agreement or by subsequent act; and by original agreement it may be by lapse of time or by the accomplishment of the object of the partnership.

By operation of law it may be by death, insanity, marriage, bankruptcy, or war between the countries of the partners. The circumstances under which each of these causes will effect a dissolution of the partnership relation are similar to those under which each of them will terminate the agency relation.

A court of equity may decree the dissolution of a partnership for any of the following causes: (1) fraud in creating the partnership; (2) insanity of a partner; (3) gross misconduct of a partner; (4) hopelessness of success.

Notice of Dissolution Required. When the partnership is dissolved by act of parties, notice of the dissolution must be given, not only to those who have had dealings with the firm, but also to the public generally. The former must have actual notice transmitted to them, but as regards the latter a general notice in a newspaper of general circulation in the neighborhood, for a reasonable period, is sufficient.

Effect of Dissolution. When the partnership is dissolved by the death of a partner, the legal title to all the firm personalty and to all its realty the title to which was in all the partners jointly, vests at once in the surviving partners, who hold it in trust for the firm. Moreover, the right of disposing of all the partnership assets, real as well as personal, vests in them. Firm creditors may proceed at law against the surviving partners, or in case of their insolvency, or in any case if by statute the liability of partners is joint and several, the creditors may proceed in equity against the estate of the deceased partner.

After dissolution, the partners may perform acts essential for closing up the business, but not with the view of creating new ventures.

SALE OF PERSONAL PROPERTY

A sale of goods is the transfer of ownership therein for a price generally in money.

In the case of a barter or exchange one thing is transferred for another; and in the case of a bailment there is a transfer of the possession of a chattel but not of the title. What is frequently called an executory sale is better called a contract to sell.

Formalities of a Sale. A sale or contract to sell requires no formalities unless it is within the provisions of the Statute of Frauds (which see). It may be oral or in writing; the price may be paid at once or promised on a future day; possession of the goods may be given the buyer immediately or retained for a time by the seller.

When Title Passes. When the title passes is governed by the intention of the parties. Where they do not express their intention it is to be inferred from their acts and the surrounding circumstances. If the goods are ready for immediate delivery the law presumes that title passes at once. If they are not, the law presumes that title is not to pass until they are put in a deliverable condition. If the sale is on approval the law presumes that title does not pass until the buyer has tried and approved them. In the case of a "sale or return" it passes to the buyer at once with the right to pass it back to the seller within the time agreed, or within a reasonable time when no time is fixed, if he chooses to do so. Where the goods are shipped C.O.D. in accordance with an order or contract, the title passes to the buyer upon delivery to the carrier, but the buyer is not entitled to possession of them until he pays the price.

Duties of the Parties. The duties of the seller are three-fold. He must furnish the thing agreed upon, transfer title to the buyer, and give him possession of it. The duties of the buyer are to take delivery and pay the price.

Warranties. A warranty is an assurance of some fact coupled with an engagement, express or implied, to make the assurance good or pay for the deficiency. Ordinarily the seller impliedly warrants that he is the owner of the subject-matter of the sale and that it is free from incumbrance. When the goods are sold by sample, he impliedly warrants that they shall conform to the sample; and when sold by description, that they shall conform to the description. When sold by a manufacturer or dealer, he is generally held to impliedly warrant that they are free from latent defects. And when selected by the seller to fulfill a particular purpose, he impliedly warrants their fitness for that purpose.

Remedies of the Buyer. When the buyer has paid for the goods and the seller refuses to deliver them, the buyer is entitled to recover the market value of the goods at the time and place of delivery, together with interest. If he has not paid for the goods he is entitled to recover the difference between the contract price and the market price at the time and place of delivery, provided the latter price is greater than the former, together with interest.

Any breach of warranty gives the buyer a right of action for damages which are the difference between the value of the goods as they are and what it would have been had the goods been as warranted. As an alternative, in most states the buyer may rescind a sale if he can return the goods uninjured within a reasonable time.

Remedies of the Seller. If the buyer fails to fulfill his duty, the seller may sue for the breach. If title to the goods has passed, he recovers the price. Also, if the goods are specific and not readily salable, he is allowed to notify the buyer that the goods are held for him and can then, too, recover the full price. If title has not passed and the goods are readily salable, the seller recovers as damages the difference between the contract price and the market price. The seller is further protected by rights against the goods. Though title has passed, the seller, so long as the goods remain in his possession, has a lien on them unless he has agreed to give credit. A lien may be enforced by rescission of the transaction or by resale of the goods. Even if the goods have already been shipped to the buyer, the seller may, if the buyer proves to be insolvent, give notice to the carrier, to stop them in transit. The carrier must comply if the goods have not been delivered, unless they have been shipped under an order bill of lading. In that event the carrier need not deliver to any one without surrender of the document.

OBLIGATIONS IRRESPECTIVE OF AGREEMENT

Obligations of this sort are customarily classified either: (1) as quasi contracts, or (2) as duties to make compensation for torts.

Quasi Contracts are so called because the remedy for their enforcement in English and American law has been similar to that granted for contracts.

Quasi contractual obligations include: (1) judgments, taxes, official and statutory obligations of various sorts, and (2) obligations arising from unjust enrichment; that is, the receipt of property or services that the recipient ought to pay for, though he has not contracted to do so.

Torts are wrongs which give rise to a duty to make compensation to the injured person. They arise from injuries to the person or property of another. Assault, imprisonment, slander, libel and some kinds of fraudulent misrepresentation are illustrations of the first kind. Trespass on real estate, wrongful assertion of possession, or ownership of chattel property (conversion) are illustrations of the second. The commonest kind of tort at the present time is negligent though unintentional, injury either to the property or the person of another. Labor disputes give rise to torts by way of boycott, or interference with the property rights of an employer. The boundaries of what is permitted to striking laborers are still somewhat unsettled, and not identical in all States.

REAL PROPERTY

Land and whatever is permanently attached thereto, together with certain incorporeal rights relating to land, are called real property.

Classification of Estates. Estates in

real property are classified with respect to: (1) quantity of interest; (2) time of enjoyment; (3) number and connection of owners; (4) manner of enjoyment.

Quantity of Interest. With respect to quantity of interest, estates in real property are of two kinds: (1) freehold; (2) less than freehold. Freehold estates are of three kinds: (1) fee-simple; (2) fee-tail; (3) for life.

Life estates are either for the life of the tenant or for the life of another person. Those for the life of the tenant include: (1) dower estate; (2) estate by the curtesy; (3) homestead estate. Estates less than freehold are also of three kinds: (1) for years; (2) at will; (3) by sufferance.

Time of Enjoyment. With respect to time of enjoyment, estates in real property are of two kinds: (1) in possession; (2) in expectancy. Estates in expectancy are of two kinds: (1) remainders; (2) reversions. Remainders are subdivided into: (1) vested; (2) contingent.

Number and Connection of Owners. With respect to the number and connection of the owners' estates in real property are of four kinds: (1) in severalty; (2) in joint tenancy; (3) in common; (4) by entirety.

Manner of Enjoyment. With respect to manner of enjoyment estates are of two kinds: (1) absolute; (2) conditional.

An absolute estate is one which is free from restriction. An estate upon condition is one which is commenced, enlarged or defeated upon the happening or performance of some condition.

Definition of Estates. *In Fee-Simple.* This is the highest estate known to the law. It is an estate of inheritance, free from any condition and of indefinite duration.

In Fee-Tail. This is an estate of inheritance which is descendable only to particular heirs of the grantee and not to his heirs in general. It had its origin in the desire of owners of great estates to keep them intact to particular families by restricting the power of alienation. In this country it is looked upon with such disfavor that, where it is recognized at all, the restraint upon free alienation is limited by statute so that the immediate grantee gets a life estate and the second taker gets the remainder in fee.

For Life. An estate for life may be created by the parties themselves or, as in the case of dower, by operation of law.

For Years. An estate for years is a mere chattel interest, even if created for a thousand years. It may be limited to commence presently or at some future time. It does not descend to a deceased lessee's heir, but vests in his executor or administrator of the deceased in the same manner as other personal property.

At Will. This is an estate which the tenant holds at the pleasure of the lessor. Statutes almost invariably require a notice to quit, and the practical effect of these statutes is to convert estates at will into tenancies from year to year or from month to month.

By Sufferance. A tenant by sufferance is one who holds over after his term expires and is allowed by the owner to continue in possession. At common law he was not liable for rent beyond the term agreed unless the lease expressly so provided; but modern statutes frequently make him liable for double rent.

In Remainder. This is an estate which is limited to commence at a future time on the termination of a precedent estate created at the same time. It is either vested or contingent. A vested remainder is one in which there is an immediate fixed right of future enjoyment. A contingent remainder is one where no right of enjoyment accrues until the happening of some uncertain event which may never happen.

In Reversion. This is the residue of an estate left in the grantor, or his heirs commencing in possession upon the determination of a particular estate granted. It is subject to the same incidents as an estate in remainder. Practically the only difference between these two estates is that a remainder is always created by act of the parties and a reversion always by operation of law.

In Severalty. This is an estate held by one person in his own right. Most legal estates in real property belong to this class.

In Joint Tenancy. A joint tenancy is an estate in which the grantees have the same interest, created at the same time, by the same conveyance, and held by them by the same undivided possession. The most important incident of this estate is the right of survivorship, that is, on the death of one joint tenant, the survivors have the entire estate. This tenancy is chiefly used for partnership and trust property.

In Common. This estate is created when two or more persons acquire aliquot shares in land. They may acquire their title from different sources, at different times, and acquire different shares.

By Entirety. This estate is created when a conveyance is made to husband and wife and the conveyance either states that shall hold by entireties or is silent as to the manner in which they shall hold. They are not joint tenants, nor are they tenants in common. Neither party can dispose of his or her interest without the assent of the other; and upon the death of either, the estate survives to the other. This kind of estate is abolished by statute in some states.

Equitable Estate. An equitable estate is a right or interest in real property not recognized at common law, but recognized and made available by courts of chancery. In general, the holder of an equitable estate is entitled to the income, or, beneficial enjoyment of his equitable estate, which, like a legal estate, may be an estate in fee, for years or for life, joint or several, in remainder or reversion, while another person, typically a trustee, has the legal title.

Modes of Acquiring Title. Original title to property is acquired in the following four ways: (1) occupancy; (2) discovery; (3) conquest; (4) cession.

Derivative Title is acquired in the following two ways: (1) by descent through consanguinity, affinity or adoption. (2) by act of the parties or by operation of law. It is acquired by act of the parties either by public or private grant or by devise. Public grant is by patent or legislative grant. Private grant is by deed or by dedication.

Deed. In its widest signification, a deed is an instrument, under seal written or printed; but the word is commonly used in the narrower meaning of a deed of conveyance of realty.

The two parties to a deed are the grantor and the grantee. If the grantor is married, his wife also should sign the deed. This is essential to convey her dower interest. And where the land conveyed is a homestead, it is also essential in order to transfer her homestead right.

The premises should be accurately and minutely described. Reference should be made to prior deeds by which title was acquired by the grantor. If the land is described by metes and bounds, and also by specifying the number of acres, and the two descriptions differ, the former will govern.

A quit-claim deed merely transfers all the right, title and interest in the land that the grantor has. A warranty deed, in addition to this, contains some or all of the following covenants of warranty: that the grantor is lawfully seized of the premises in fee-simple; that the premises are free from all incumbrances; that the grantor has good right to sell the same to the grantee, and that he will; and that his heirs, executors and administrators shall warrant and defend the same to the grantee, his heirs, and assigns forever, against the lawful claims of all persons whatsoever.

A deed is executed by the grantor signing it and annexing thereto his seal. If the grantor is a corporation, the deed should be signed by its president or by some other officer authorized so to do. At common law the sealing of the deed was the most important act in its execution. In some states, by statute, sealing is not essential. In some states two witnesses are essential, in some, one, and in others none. In order that the deed may be recorded, it must also be acknowledged.

To pass the title to the property the deed must be delivered by the grantor or his agent to the grantee or to some one on his behalf.

A delivery of the deed by the grantor to a third party to hold until the grantee has performed certain conditions, or until a certain time has elapsed, does not pass the title until the condition has happened or the time elapsed. Such a delivery is called a delivery in escrow.

Recording a deed is not essential to pass title to the grantee, but if the grantor should make a second conveyance to an innocent purchaser, or in some states if the grantor's creditors without notice of the conveyance should attach the land, the later purchaser or the creditors could defeat the original conveyance. To protect himself, the grantee should have the deed recorded at once. To do so gives constructive notice to the world that the title to the land is in him.

Wills Concerning Real Property. Title to real estate as well as to personalty may be acquired by devise or will in all the states of the Union. To render a person competent to transfer title by this means he must be of full age and of sound mind. Moreover, he must act voluntarily.

In most of the states a will must be in writing, signed by the testator, or by some person in his presence and by his direction, and attested by witnesses, who must subscribe their names thereto in the presence of

the testator. The form of wording a will is immaterial as long as its intent is clear.

Witnesses. Most of the states require two witnesses, except in Connecticut (3), Maine (3), Massachusetts (3), New Hampshire (3), South Carolina (3), Vermont (3).

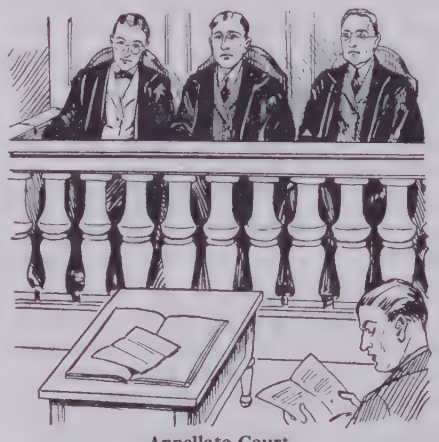
Males and females are competent to make wills at 18 years in the following states: California, Connecticut, Hawaiian Islands, Idaho, Montana, Nevada, North Dakota, Oklahoma, South Dakota, Utah; and in the following states only females at 18 years: Colorado, District of Columbia, Illinois, Maryland, Missouri, Washington, Wisconsin.

In the following states persons of 18 years may dispose of personal property only: Alabama, Arkansas, Missouri, Oregon, Rhode Island, Virginia, West Virginia. In Georgia any one over 14 years, and in Louisiana any one over 16 years, is competent to make a will. In Colorado, persons of 17 years, and in New York males of 18 and females of 16 years may dispose of personalty.

REMEDIAL RIGHTS

The law does not undertake to enforce specifically most of the legal duties created by status, contract, quasi-contract, ownership of property, or by the law of torts. Instead, a right to recover appropriate pecuniary damages is given. The right of action allowed by law for breach of any legal duty may be called a remedial right. When a right *in rem* is violated by a particular individual the owner of the right *in rem* then acquires, besides his original right against all the world, a special right *in personam* against the wrongdoer.

Thus, an owner of land acquires a right *in personam* against a trespasser for the recovery of damages suffered by the trespass. So a right *in personam* may change its character when the right has been violated. The right of a servant to employment under a contract becomes a right of action for damages if the employer wrongfully discharges the servant. Both rights against the master are rights *in personam*, but the right of action arising on breach of the contract is different from the right to employment which existed under the contract when unbroken.



LEGAL REMEDIES

Closely connected with the subject of legal rights and duties is the subject of legal remedies for their enforcement. The rules defining the rights and duties of persons has been called the substantive law, that defining the remedies and the procedure and proof, the adjective law. Adjective Law may be divided into the law of procedure and of proof or evidence. Procedure in turn may be divided into civil procedure and criminal procedure; and civil procedure into procedure at law and in equity.

Civil Procedure. The fundamental steps of civil procedure at law are the beginning of the action by a writ or notice to the defendant, pleading, trial, judgment and execution.

Pleading consists first of a statement of the plaintiff's case variously styled a declaration or complaint. This is followed by a plea or answer of the defendant denying some or all of the facts alleged in the plaintiff's statement, or alleging further facts, or both. The answer is sometimes followed by other pleadings. The ultimate result of the pleading is that each party has set forth the facts on which he relies, and these facts have either been admitted or denied by the other party. If essential facts are denied it is necessary to try the disputed question by means of proof.

But not only questions of fact but also questions of law may be involved in a dispute. The parties may agree as to the facts and dispute only as to whether on those facts the paintiff has a right of action. Or the defendant may dispute both the truth of the facts alleged by the plaintiff and also assert that even though the facts are as the plaintiff alleges, still the plaintiff has no cause of action. Questions of law are decided by a judge, and, in accordance with his decision on questions of law and a jury's verdict on questions of facts, final judgment is given by the court for the plaintiff or defendant, whichever is entitled to it. In the United States at the present day many questions of fact are decided by judges without the aid of juries, but owing to the provisions of state constitutions, this is generally impossible unless the parties waive their right to trial by jury.

Appellate Court
In an appellate court there are from three to seven judges.

Procedure in Equity differs from procedure at law in various respects. The plaintiff's pleading is called a bill or petition and is fuller than is usual in a declaration at law. The defendant's answer also is fuller as to facts charged in the bill. There is no jury; questions of fact as well as of law being determined by the judge.

The most fundamental difference between *equity* and *law*, however, is in regard to the character of the final order of the court. When judgment is rendered at law in favor of the plaintiff an execution for the amount of the judgment is put in the hands of a sheriff, who endeavors to satisfy the execution by seizure of the defendant's goods. The decree of the court of equity, however, is directed to the person of the defendant, ordering him on pain of imprisonment, to do what the court directs. A court of law can give only a money judgment, a court of equity can effectively order a defendant to do many things besides the payment of money; and not only are affirmative orders possible, but negative orders or injunctions are possible, and constitute one of the most important branches of equity jurisdiction.

In many states of America the procedure at law and in equity is now made substantially identical, and even in states where this is not so, the same court generally has jurisdiction of both actions at law and suits in equity, but the general constitutional requirement of jury trial in an action at law, involves the persistence of a difference between matters originally within equitable jurisdiction and other matters. Moreover, the distinction between equitable relief and legal relief is still necessarily observed.

Criminal Procedure is, in the main, like civil procedure at law; the chief difference relating to the beginning of the proceedings. A person may be charged with crime by complaint made by any citizen to a magistrate who, if satisfied that there is reasonable cause for the complaint, and if he has jurisdiction to try cases of the sort, may proceed with the trial of the accused or otherwise may hold the accused for trial in the proper court.

Another method of beginning a criminal prosecution is by information filed by a prosecutiug officer, but the commonest method for serious crimes is by indictment found by grand jury on a case presented to it by the prosecuting officer. The accused may then be arrested and held for trial either by confining him or by admitting him to bail. Those who give bail are regarded as private keepers of a prisoner and are bound to produce him when called upon to do so.

Greater particularity is required in the criminal pleading of the indictment than is necessary in civil actions. The defendant makes no answer or plea other than either guilty or not guilty. The latter plea compels the government to prove everything essential to make out the guilt of the accused of the crime charged.

In civil cases it is sufficient for one alleging facts in his pleading to prove them by a mere preponderance of evidence; but in criminal trials the government must prove the prisoner's guilt beyond a reasonable doubt in order to convict him.

Appellate Procedure. Trials, both civil and criminal, are ordinarily conducted by a single judge, but appellate courts are established to revise the rulings of law made by trial judges if these rulings are questioned. When the trial judge makes a ruling of law the party aggrieved by his decision may reserve the right to question the correctness of the ruling in an appellate court, which generally consists of from three to seven judges sitting together. If the ruling at the trial is held to be incorrect by the appellate court, a new trial is ordered.

Evidence. A very important branch of the adjective law is that relating to evidence. It is an obvious rule of logic as well as of law that no testimony is admissible which is not relevant to the facts in dispute; but not all evidence which is relevant is admissible. Indeed the law of evidence has been defined as consisting of rules excluding various kinds of logically relevant testimony; the most important of these rules is that which excludes hearsay evidence.

Of vital importance also is that which excludes oral evidence of the contents of a written document when the written document is obtainable and which makes a

written contract between parties a conclusive statement of their agreement. The rules of evidence grew up as an accompaniment of the jury system and, to a large extent, are designed to avoid the misleading of a tribunal composed of twelve men unlearned in the law and perhaps of no great education. A very common kind of legal errors carried from trial courts to appellate courts consists of erroneous rulings admitting or excluding proffered testimony.

Days of Grace. The Negotiable Instruments Law, which has been enacted in all the states and territories, abolishes days of grace. In Massachusetts, New Hampshire, North Carolina and Rhode Island, however, this Act has been amended by providing that instruments payable at sight shall be allowed three days of grace. In these states instruments payable at sight are to this extent differentiated from instruments payable on demand. In the remaining states there is no distinction in legal effect between instruments payable at sight and on demand.

Exemptions. In all the states and territories, debtors are allowed certain property exempt from seizure for debt. These exemptions are in various forms. Homestead laws usually protect a homestead of stated moderate value. Other exemptions are usually allowed—fixed either by the value of the exempt property, or by the character of the property in question (such as necessary tools of a debtor's trade). In a number of states, life insurance to a limited amount for the benefit of wife and children which is taken out by a debtor, is exempt though he is insolvent.

Bankruptcy. The Federal Bankruptcy Law provides for both voluntary and involuntary bankruptcy. Any person except a municipal, railroad, insurance, or banking corporation, may become a voluntary bankrupt. Any natural person except one who works for wages or salary of not more than $1,500 or who is chiefly engaged in farming, and any business corporation, except a railroad, insurance, or banking association, may be adjudged an involuntary bankrupt on petition of three or more creditors having provable claims aggregating $500 or more. If there are only twelve creditors, one petitioning creditor is sufficient. In order to sustain an involuntary petition, creditors must prove that the debtor has committed an act of bankruptcy. Such acts generally consist of a fraudulent conveyance, which is a disposition by a debtor of property without adequate consideration when he is or thereby is rendered insolvent; or a preference, which is a payment by an insolvent debtor to one of his creditors, which leaves him with insufficient assets to pay his other creditors a similar proportion of their claims. In voluntary bankruptcy, the debtor is adjudicated a bankrupt as soon as he files his petition. In involuntary bankruptcy, adjudication follows proof by the creditor of the necessary facts. After adjudication, proceedings in voluntary and in involuntary bankruptcy are identical. The debtor's property except such as is exempt under the local state law, is put into the hands of a trustee in bankruptcy chosen by the creditors, and the proceeds distributed ratably under the supervision of the court to creditors who prove their claims. If the debtor complies with the requirements of the law in turning over his property and answering truthfully interrogations regarding it, etc., he is granted a discharge from all provable debts which were owed by him at the beginning of the bankruptcy proceedings. Property acquired after that time does not pass to his trustee, and debts incurred after that time are not provable or discharged.

COMMERCIAL LAW IN THE VARIOUS STATES

States and Territories	Interest Laws			Statutes of Limitation		
	Legal Rate Per Cent	Allowed by Contract Per Cent	Penalty for Usury	Judgments Years	Notes Years	Open Accounts Years
Alabama	8	8	Forfeit interest if not paid	20	6	3
Alaska	8	12	Double excess already paid recoverable; forfeit all interest not paid	10	6	6
Arizona	6	10	Forfeit excess if not paid	5	4	3
Arkansas	6	10	Forfeit principal and interest if not paid	10	5	3
California	7	12	Forfeit excess of interest if not paid	5	4	4
Colorado	8	24	Forfeit excess of interest if not paid	20	6	6
Connecticut	6	12	Fine or imprisonment or both, excess forfeited	20	6	3
Delaware	6	6	Forfeit excess whether or not paid	10	6	3
District of Columbia	6	8	Forfeit interest, whether or not paid	12	3	3
Florida	8	10	Forfeit interest if not paid; double excess recoverable if paid	20	5	3
Georgia	7	8	Forfeit excess, if not paid	7	6	4
Hawaii	8	12		20	6	6
Idaho	7	10	Forfeit interest whether or not paid	6	5	4
Illinois	5	7	Forfeit interest unless borrower is corporation	20	10	5
Indiana	6	8	Forfeit excess if not paid	20	10	6
Iowa	6	8	Forfeit interest if not paid	20	10	5
Kansas	6	10	Forfeit double excess whether or not paid	5	5	3
Kentucky	6	6	Forfeit excess if unpaid	15	15	5
Louisiana	5	8	Forfeit excess whether paid or unpaid	10	5	3
Maine	6	Any	No provision except for small loans	20	6	6
Maryland	6	6	*Forfeit excess if unpaid	12	3	3
Massachusetts	6	Any	No provision except for small loans	20	6	6
Michigan	5	7	Forfeit interest if unpaid	10	6	6
Minnesota	6	8	Forfeit interest if unpaid; forfeit excess if paid	10	6	6
Mississippi	6	8	Forfeit interest if unpaid; if more than 20%, both principal and interest	7	6	3
Missouri	6	8	Forfeit excess	10	10	5
Montana	8	10	Forfeit double amount of interest whether paid or unpaid	10	8	5
Nebraska	7	10	Forfeit interest	5	5	4
Nevada	7	12	Forfeit excess	6	6	4
New Hampshire	6	Any	No provision	20	6	6
New Jersey	6	6	*Forfeit interest	20	6	6
New Mexico	6	12	Forfeit double amount of interest whether paid or unpaid	7	6	4
New York	6		*Forfeit of principal and interest if unpaid, excess if paid; misdemeanor; any rate allowed on collateral call loans of over $5,000	20	6	6
North Carolina	6	6	Forfeit interest if unpaid, and double interest if paid	10	3	3
North Dakota	6	9	Forfeit interest if unpaid and double interest if paid	10	6	6
Ohio	6	8	Forfeit interest if unpaid	15	15	6
Oklahoma	6	10	Forfeit double interest whether paid or unpaid	5	5	3
Oregon	6	10	Forfeit principal and interest if unpaid	10	6	6
Pennsylvania	6	6	Forfeit excess whether paid or unpaid	20	6	6
Porto Rico	6	12		5	3	3
Rhode Island	6	30	Forfeit excess if unpaid	20	6	6
South Carolina	7	8	Forfeit interest if unpaid and double interest if paid	20	6	6
South Dakota	7	10	Forfeit all interest whether paid or unpaid; misdemeanor	20	6	6
Tennessee	6	6	Forfeit of excess whether paid or unpaid; misdemeanor	10	6	6
Texas	6	10	Forfeit all interest if unpaid; double interest if paid	10	4	4
Utah	8	12	Forfeit excess if unpaid	8	6	4
Vermont	6	6	Forfeit excess whether paid or unpaid	8	6	6
Virginia	6	6	Forfeit all interest whether paid or unpaid	20	5	3
Washington	6	12	Forfeit double interest if unpaid	6	6	3
West Virginia	6	6	Forfeit excess if unpaid	10	10	5
Wisconsin	6	10	Forfeit all interest if unpaid, and treble excess interest if paid	20	6	6
Wyoming	7	10	Forfeit interest if unpaid	10	10	8

*In Maryland, New Jersey and New York a corporation cannot set up usury as a defense.

LEGAL HOLIDAYS

In the United States.

January 1. *New Year's Day*: In all the states (including the District of Columbia).

January 8. *Anniversary of the Battle of New Orleans*: In Louisiana.

January 19. *Lee's Birthday*: In Alabama, Arkansas, Florida, Georgia, Mississippi, North Carolina, South Carolina, Tennessee, Virginia.

February or early in March. *Mardi-Gras*: In Alabama, Florida (in counties where there are carnival associations), Louisiana (in five parishes).

February 12. *Lincoln's Birthday*: In California, Colorado, Connecticut, Delaware, Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Montana, Nebraska, Nevada, New Jersey, New York, North Dakota, Ohio, Oregon, Pennsylvania, South Dakota, Tennessee, Utah, Washington, West Virginia, Wyoming.

February 14. *Admission Day*: In Arizona.

February 22. *Washington's Birthday*: In all the states (including the District of Columbia).

March 2. *Anniversary of Texan Independence*: In Texas.

March 4. *Inauguration Day* (every four years): In District of Columbia only.

March 25. *Maryland Day*: In Maryland.

Good Friday: In Delaware, Florida, Louisiana, Maryland, Minnesota, New Jersey, Pennsylvania, Tennessee.

April 13. *Thomas Jefferson's Birthday*: In Alabama.

April 15. *Arbor Day*: In Utah.

April 19. *Patriots' Day*: In Maine and Massachusetts.

April 21. *Anniversary of the Battle of San Jacinto*: In Texas.

April 26. *Confederate Memorial Day*: In Alabama, Florida, Georgia and Mississippi.

May 10. *Confederate Memorial Day*: In North Carolina and South Carolina.

May 20. *Anniversary of the signing of the Mecklenburg Declaration of Independence*: In North Carolina.

May (last Friday). *Pioneer Day*: In Montana, observed in public schools.

May 30. *Decoration Day* or *Memorial Day*: In all the states and territories (and District of Columbia) except Alabama, Georgia, Louisiana, Mississippi, New Mexico, North Carolina, South Carolina, Tennessee, Texas, Wisconsin.

June 3. *Confederate Day*: In Tennessee.

June 3. *Jefferson Davis Birthday*: In Alabama, Florida, Georgia, Mississippi, Tennessee, Texas, South Carolina, and Virginia. In Louisiana, known as "Confederate Memorial Day."

June 15. *Pioneer Day*: In Idaho.

July 4. *Independence Day*: In all the states, District of Columbia, and territories.

July 13. *Forrest's Birthday*: In Tennessee.

July 24. *Pioneer Day*: In Utah.

August 1. *Admission Day*: In Colorado.

August 16. *Bennington Battle Day*: In Vermont.

September (first Monday). *Labor Day*: In all the states (and District of Columbia) except Nevada, New Mexico, Wyoming. In Louisiana, observed in Orleans parish. In Wyoming, by proclamation of the governor.

September 9. *Admission Day*: In California.

September 12. *"Old Defenders' Day"*: In Baltimore, Md.

September, first Saturday after the full moon. *Indian Day*: In Oklahoma.

October (second Tuesday). *Fraternal Day*: In Alabama.

October (second Friday). *Farmers' Day*: In Florida.

October 12. *Columbus Day*: Every state and territory except Alaska, Arkansas, District of Columbia, Florida, Georgia, Hawaii, Iowa, Kansas, Maine, Minnesota, Mississippi, Missouri, North Carolina, Oklahoma, Philippines, South Carolina, South Dakota, Tennessee, Utah, Virginia, Wisconsin, Wyoming.

Armistice Day
The first Armistice Day celebration in Chicago, November 11, 1918.

October 31. *Admission Day*: In Nevada.

November 1. *All Saints' Day*: In Louisiana.

November 11. *Armistice Day*: In Alabama, Arizona, California, Colorado, Connecticut, Delaware, Florida, Hawaii, Illinois, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Minnesota, Mississippi, Missouri, Montana, Nebraska, New Hampshire, New Jersey, New Mexico, North Carolina, North Dakota, Ohio, Oklahoma, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, Wyoming.

November. *Thanksgiving Day* (last Thursday in November): Is observed in all the states, and in the District of Columbia, though in a few states it is not a statutory holiday and in a number is made dependent on proclamation by the Governor.

December 25. *Christmas Day*: In all the states, District of Columbia and territories.

Sundays and fast days appointed by the Governor are designated as legal holidays in many states. In South Carolina, Thursday of Fair week is a legal holiday.

Arbor Day is a legal holiday in Rhode Island (second Friday in May), in Utah (April 15), in Nebraska (April 22), and in Wyoming (a day in Spring designated by the Governor). But though many other states provide for its celebration in schools and otherwise, they do not make it a legal holiday.

General election day is in most states a holiday and in some states local election days are holidays in that locality.

Old English Holidays. These holidays, with their names, had their origin in medieval England when the state religion was that of the Church of Rome, and they are still observed generally or in some parts of England, Scotland and Ireland.

January 6. *Twelfth Day*, or *Twelfth-tide*, sometimes called Old Christmas Day, the same as Epiphany. The previous evening is *Twelfth Night*, with which many social rites have long been connected.

February 2. *Candlemas*: Festival of the Purification of the Virgin. Consecration of the lighted candles to be used in the church during the year.

February 14. *Old Candlemas*: St. Valentine's Day.

March 25. *Lady Day*: Annunciation of the Virgin. April 6 is old Lady Day.

June 24. *Midsummer Day*: Feast of the Nativity of John the Baptist. July 7 is old Midsummer Day.

July 15. *St. Swithin's Day*: There was an old superstition that if rain fell on this day it would continue forty days.

August 1. *Lammas Day*: Originally in England the festival of the wheat harvest. In the Church the festival of St. Peter's miraculous deliverance from prison. Old Lammas Day is August 13.

September 29. *Michaelmas*: Feast of St. Michael, the Archangel. Old Michaelmas is October 11.

November 1. *All hallowmas*: Allhallows or All Saints' Day. The previous evening is All hallowe'en, observed by home gatherings and old-time festive rites.

November 2. *All Souls' Day*: Day of prayer for the souls of the dead.

November 11. *Martinmas*: Feast of St. Martin. Old Martinmas is November 23.

December 28. *Childermas*: Holy Innocents' Day.

Lady Day, Midsummer Day, Michaelmas and Christmas are quarter (rent) days in England, and Whitsunday, Martinmas, Candlemas and Lammas Day, in Scotland.

Shrove Tuesday, the day before Ash Wednesday, and Maundy Thursday, the day before Good Friday, are observed by the Church. Mothering Sunday is Mid-Lent and the old rural custom obtains of visiting one's parents and making them presents.

Other Countries. Christmas and New Year's Day are quite universally observed over the world. In Roman Catholic nations, such church days as All Saints', Ascension, Assumption, Epiphany, Immaculate Conception and Corpus Christi are often holidays. In Lutheran countries, Epiphany, Annunciation, Good Friday, Easter Monday, Ascension, White Monday, Ash Wednesday and Corpus Christi are holidays.

LABOR LAW AND LEGISLATION

THE relation of employer and employee arises from contracts concerning labor, the right to make such contracts being a property right in which both parties are interested, and in which they are protected by constitutional guaranties.

The Labor Contract. Special rules of common law govern labor contracts, embodying the results of numerous decisions of the courts. An employer is presumed to employ his workmen lawfully, to compensate them fairly, and to have due regard for their health and safety. The workman is presumed to be reasonably competent, to be ready to obey reasonable orders, and to use ordinary care in the performance of his work.

As a result largely of modern industrial conditions, the inequality between employers and employees as regards the making of contracts has become so conspicuous that statutes have been enacted regulating, in various ways, the conditions of employment, and in so far taking the matter out of the hands of the immediate parties to the contract. These regulations, as well as the rules of common law, form a part of every labor contract to which they are applicable. Subject thereto, adults mentally capable may contract freely, and be held mutually to the standards indicated.

Enforcement. There is not, generally speaking, any specific performance of a labor contract enforceable at law, and either party may terminate such a contract at any time, for any reason or without reason, being liable only in damages for the breach of a contract for a fixed term. A statute of Colorado attempts an exception to this rule by forbidding the discharge of a workman between the ages of eighteen and sixty solely on account of age, but such a law is doubtless without value.

In a few states, chiefly a Southern agricultural group, laws have been enacted providing for punishment, as for a crime, where a workman entered into a contract for employment, receiving money or supplies in advance, and then failed or refused to render the service contracted for. It was insisted that it was the intent to defraud that was declared criminal, and not the mere breach of contract; but such laws have frequently been declared unconstitutional as tending to establish a system of peonage or involuntary servitude. Some have also penalized the procuring of transportation money and the subsequent refusal to carry out the contract to labor. But it seems difficult, if not impossible, for all such laws to escape the charge of unconstitutionality where the basal fact is a personal indebtedness by which it is sought to coerce the employee to render service or, in the alternative, to suffer imprisonment. For the same reason a man cannot be held to work out a fine and costs under private control where another has paid the same or become his surety, as has been attempted in a few states. However, laws of the above classes are still found on the statute books of some states.

Seamen were long an exception to the rule forbidding involuntary servitude, but they are not so since the enactment of the Seamen's Act by Congress in 1915.

A special class of employees is embraced in laws which provide a penalty for the abandonment of locomotives or trains at other than terminal or division points, while more general laws of Nevada, New York and Washington prohibit any abandonment of employment that would knowingly jeopardize life or limb, or expose valuable property to destruction.

Notice of Termination. If the employer contracts with his employees for a notice of their purpose to leave service, he may be required by statute to give corresponding notice, under like forfeiture, of his intention to discharge. Laws to this effect are found in Maine, Massachusetts, New Jersey, Pennsylvania, Rhode Island, South Carolina and Wisconsin.

Voting

A scene in the election commissioners' office when young voters are receiving instructions in how to vote. Note the officers of the election and the ballot box.

The giving of a recommendation or clearance card at the termination of employment is not obligatory on the employer, even though a new employer may demand such certificate before employing an applicant for service. A few states have enacted laws directing such cards, or a statement of cause of termination of employment, to be furnished on the request of the employee, but such laws are of at least doubtful validity. The states having them are California, Indiana, Missouri, Montana, Nebraska, Nevada, Ohio, Oklahoma and Oregon. The courts of Georgia, Kansas and Texas have declared such laws unconstitutional, while the Supreme Court of Oklahoma sustained the law of that state on the subject.

Interference with Contracts. Third parties interfering with a contract of employment, unjustifiably inducing the breach thereof by either employer or employee, are liable to the injured person in damages, even though the contract was terminable at will by either of the parties to it. There must be knowledge of the contract, and a mere attempt without damage will support no action. Knowingly interfering with a contract for service by hiring or enticing away an employee is made a penal offense in Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina and Tennessee. The attempt entails the same penalty as the performance in Alabama and Georgia. A law of Louisiana makes it an offense to move the goods or property of an employee without the consent of the employer. There is a federal statute making it an offense to procure workmen in government arsenals or armories to leave their employment during the term of their contract, or to retain such a workman after notice of such contract. Other forms of interference will be noted under the heading of strikes.

The giving of discounts or bonuses to employees who make purchases for the employers, or the giving of gratuities to employees to influence them in regard to their employers' business, is against the law in some twenty states. It is restricted to designated groups (as chauffeurs) in a few states, but is usually of general scope. A few states undertook to prohibit any giving or receiving of tips, but most of these laws have been repealed.

CIVIL AND POLITICAL RIGHTS OF EMPLOYEES

Voting. Most states of the Union provide a penalty for employers interfering with, or seeking to coerce, employees in the exercise of their rights as voters, either by posting notices or printing them on pay envelopes,

or threatening dismissal, reduction of wages, or the closing of the plant in case of the success of any designated candidate or party. The law of Minnesota protects employees in the exercise of any natural right or any right or privilege of citizenship. The California and Wyoming statutes mention the candidacy of employees; while in Colorado no employer, foreman or manager of a railroad, or of mining or manufacturing work carried on in the precinct, may act as judge, clerk or watcher at the polls in any election. Many of these laws direct the allowance of time to vote without loss of wages, though the Supreme Court of Illinois held such a provision unconstitutional and void.

Freedom as Traders and Similar Privileges. Freedom of workmen in the selection of their places of trade is the object of laws of Arizona, Arkansas, California, Colorado, Florida, Idaho, Indiana, Iowa, Kentucky, Massachusetts, Nevada, New Jersey, New Mexico, Ohio, Oregon, Tennessee, Texas, Utah, Washington and West Virginia. Free choice of boarding or lodging houses is provided for in the laws of Idaho, Massachusetts, Montana, Nevada, Oregon and Utah, while in Michigan the same protection is extended to employees in the choice of life or accident insurance, and in Tennessee to the choice of the family physician, and the withholding of any part of an employee's wages to pay a company doctor without the full consent of such employee is forbidden.

WAGES

Fundamental Principles. The matter of wages is primarily one for determination by contract, as regards the rate, and the time, place and medium of payment. At common law the court will, in the absence of a specified rate, order the payment of such a sum as the services rendered are shown to be reasonably worth; if the contract is entire, payment can be demanded only on the completion of the work; if separable, at such times as are shown to be reasonable, or at times fixed by the custom of the community or the trade. No wages can be recovered for service rendered in violation of law; as for work on Sunday, when Sunday labor is prohibited; or for services as an engineer when the workman is without the license required by law; or for work in excess of eight hours when the statute restricts the time to eight hours.

Payee. The payee will usually be the workman or his personal representative, though statutes of Alabama, Arizona, Connecticut, Delaware, Florida, Georgia, Michigan, Mississippi, New Jersey, Pennsylvania and Virginia authorize the payment of wage debts not in excess of a specified sum directly to the heirs of a deceased employee. Payments to one demanding from the employer the wages of a workman on the claim that the latter is indebted to the claimant can be made only after all legal formalities are complied with, or the employer will be liable to the employee regardless of the payment made to the claimant. In every state there are statutes reserving to workmen (in many only to those having dependents) a certain amount or percentage of their wages which is not subject to garnishment while in the hands of the employer. In a number of states, assigning claims or taking or sending them outside the state in order to avoid the exemption laws in favor of wage earners is forbidden.

Recovery. Another law that is found in practically every jurisdiction, and in the federal statutes, is one that makes a debt for wages for labor a preferred claim in the settlement of the estate of a deceased or insolvent employer. Mechanics' liens are likewise universally granted by statute. Where the enforcement of such liens is not convenient, as in the case of public works or railroad construction work, contractors are in a number of states required to give bond for the payment of wages due their workmen; or failure to pay wages out of current receipts may be penalized.

Wage suitors are favored by the laws of some states, as by allowing a successful claimant of wages an attorney's fee (a law as to the constitutionality of which the courts differ); by prohibiting a stay of execution on a judgment for a wage debt; by declaring no property exempt from execution under such a judgment, or by placing wage suits at the head of the trial docket.

Assignments. Assignments of future earnings are restricted in the interests of the workman, and especially of his family. Such laws have been upheld, though they undoubtedly restrict the freedom of contract. The law may require that the assignment shall be recorded, or that the employer shall be notified of the assignment or shall accept or consent to the same, or that the wife or husband of a married person making an assignment shall join therein; discounts or interest rates may also be limited.

Except for the laws that merely require recording, these statutes are of recent enactment. States having laws embodying these provisions in whole or in part are Arkansas, California, Colorado, Connecticut, Delaware, Indiana, Iowa, Louisiana, Maine, Maryland, Massachusetts, Minnesota, New Jersey, New York, Pennsylvania, Rhode Island, Tennessee, Washington, Wisconsin and Wyoming. Assignments to secure loans or future advances are declared void in Georgia; and a law of Indiana declaring all assignments of future earnings void has been held valid.

Rates. Rates of wages on public works are fixed by statute in a few states, either at the current rate in use for work of the sort that is to be done, or at an amount named in the law. The states having such laws are Arizona, California, Maryland, Massachusetts, Nevada, New York and Oklahoma. A Virginia statute orders a reasonable amount to be paid as salvage in the case of wrecked goods, and provides for arbitrators where the laborer and the owner of the goods do not agree; but there is no nearer approach than this to the direct determination of wages in private undertakings. Indirectly the matter is regulated by forbidding deductions by way of fines for imperfect work (Massachusetts), or "on any pretext" (Indiana). The law of Louisiana forbids all fines or deductions except for the actual value of willful or negligent damage.

The same object is in view where, when coal mining is paid for by weight, the law forbids the screening of coal before weighing, or directs that all coal mined shall be weighed. Such laws are found in a majority of the coal mining states.

Deductions for lost time are limited by laws of California and Massachusetts to an amount proportionate to the day's wages, except that in California a minimum charge as for thirty minutes may be made, though for a less period. In Michigan no deductions may be made except by voluntary agreement; nor in Ohio for such items as tools damaged, without express contract. The law of Connecticut forbids any discount for the prepayment of wages, while Arkansas permits such discount not in excess of a rate of ten per cent per annum.

Time of Payment. Statutes regulating the time of the payment of wages have been held constitutional, though not uniformly. These laws may be of general application, or restricted to classes of employment, or to corporations, or they may apply only where the number of employees exceeds a given minimum. The law of Oregon requires employers to pay wages monthly; and that of Virginia requires it in excelsior mills and sawmills. In the following states, semimonthly or biweekly payments are prescribed: Arizona (companies and corporations), Arkansas (corporations), California, Colorado (corporations), Georgia (except sawmill and turpentine industries), Illinois (corporations), Iowa (coal mines and railroads), Kansas (corporations), Kentucky (corporations), Louisiana, Maryland (corporations), Michigan (corporations), Minnesota (public service corporations), Missouri (mining, manufacturing, public service corporations), Montana, Nebraska (railroads), Nevada, New Jersey, New Mexico (mining, manufacturing, railroads), New York (railroads), North Carolina (railroads), North Dakota (railroads), Ohio, Oklahoma (mining, manufacturing, transportation companies), Pennsylvania, South Carolina (railroad shops), South Dakota (railroads), Tennessee, Texas (corporations), Utah, Virginia (except excelsior mills and sawmills), West Virginia (mining, manufacturing, railroads), Wisconsin, Wyoming. The following have a weekly pay day: Connecticut (corporations), Indiana (if demanded), Maine (except lumbering), Massachusetts, New Hampshire, New York (except railroads), Rhode Island (corporations), Vermont.

A number of states direct that wages due discharged employees shall be paid them without waiting for the regular pay day. These are Arizona, Arkansas, California, Colorado, Illinois, Iowa (railroads), Kentucky, Maine, Massachusetts, Michigan, Minnesota, Oregon, South Carolina, Utah, Wisconsin and Wyoming. These laws, as a rule, apply to the same classes of employees as the provisions relating to regular pay days.

Medium of Payment. The medium of payment is the subject of a number of laws which either prohibit the use of scrip, tokens or store orders, as in Colorado, Louisiana, Maryland, Missouri, Montana, New Hampshire, New York and Utah; or require that, if issued, they shall be redeemable in money, as in Arizona, Arkansas, California, Florida, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Mississippi, Nevada, New Jersey, New Mexico, North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, Tennessee, Vermont, Virginia, Washington, West Virginia and Wisconsin. The North Carolina statute

on this subject directs that scrip or tokens shall be redeemable at face value and transferable, but this is held not to require orders for merchandise to be redeemed in money. A Pennsylvania statute levies a twenty-five per cent tax on all scrip not redeemed within thirty days after its issue. Courts rule diversely as to the validity of statutes forbidding the use of scrip, but the Supreme Court has upheld a law requiring its redemption in money at face value.

Company stores, or the "truck system" of wage payment, may also be prohibited, as in Colorado, Maryland (railroad and mining companies), New York (contractors on public works) and Pennsylvania (mining and manufacturing companies); or their operations may be regulated by forbidding the charging of a higher cost to employees than to others, or of a higher rate than is charged by other stores, as by the laws of Arkansas, Connecticut, Indiana, Ohio, Virginia and West Virginia.

HOURS OF LABOR

General Principles. The length of a day's work for adult males is, in general, a matter of contract with which the law can interfere only on the ground that the public welfare requires its statutory regulation. A number of states have laws declaring the number of hours that constitute a day's work generally, but as these laws do not interfere with contracts for longer service, they are of no practical effect.

Public Works. On public works it is competent for the state to declare the length of time workmen may labor, even though they are employed by contractors, since the state has the right to fix the terms on which work may be done for it, or on which persons may deal with it. A number of states and the federal government have laws or provisions in their constitutions fixing the hours of labor, mainly prescribing eight as the limit. These states are Arizona, California, Colorado, Connecticut, Delaware (city of Wilmington), District of Columbia, Idaho, Indiana, Kansas, Kentucky, Maryland (city of Baltimore), Massachusetts, Minnesota, Montana, Nevada, New Jersey, New Mexico, New York, Ohio, Oklahoma, Oregon, Pennsylvania, Texas, Utah, Washington, West Virginia, Wisconsin and Wyoming. All these laws provide for the eight-hour day except Massachusetts, where nine hours is the limit unless municipalities, by special vote, adopt the eight-hour day. Other states have laws relating to highways only, but these apply less to the employment of labor than to the working out of taxes.

Railroads. Considerations of public safety validate laws limiting the hours of labor of employees on railroads. The federal statute makes sixteen hours out of any twenty-four the maximum work time of employees engaged in the movement of interstate trains or trains in the District of Columbia, and nine hours the maximum for train dispatchers and telegraph or telephone operators whose employment affects the movement of such trains. Employees who have been on duty sixteen hours continuously are to be allowed not less than eight consecutive hours off duty. A day of eight hours is fixed as the measure or standard of a day's work for the purpose of reckoning wages of railroad employees engaged in any capacity in the operation of trains. The periods fixed by state laws vary, but obviously where interstate traffic is affected no labor in excess of that allowed by the federal statute will be permitted. The difficulty of separating the two classes of operation tends to diminish the effect of state laws in this field, where Congress has acted; or as a state commission reports, "we feel that since the Federal Hours of Service Law has been passed, the state Hours of Service Law is obsolete, and there is no attempt to enforce the same."

Street Railways. The hours of labor on street railways are regulated by statute in several states, as follows: twelve in California, New Jersey, Pennsylvania and South Carolina; ten in Louisiana, New York, Rhode Island and Washington; nine in eleven consecutive hours in Massachusetts. In New Jersey and New York the service must be rendered during consecutive hours, including one-half hour for dinner; and in Louisiana and Rhode Island, within twelve consecutive hours. This law has also been said to provide for public safety and is supported on that ground.

Mines, Smelters and Similar Places. The hours of labor in underground mines, smelters and reduction works are restricted to eight per day in Arizona, California, Colorado, Idaho, Kansas (lead and zinc mines), Missouri, Montana, Nevada, North Dakota, Oklahoma, Oregon, Utah, Washington and Wyoming. The Nevada statute applies also to work in open cut mines and in plaster and cement mills. A New York law regulates the hours of labor of workmen in compressed air, the limit ranging from eight hours in twenty-four in two shifts of four hours each where the pressure does not exceed eighteen pounds to the square inch, to one hour out of twenty-four, equally divided by an interval of six hours where the pressure exceeds forty-eight pounds but does not exceed fifty pounds. No employment is permitted under a pressure in excess of fifty pounds except in emergency. Similar laws are found in New Jersey and Pennsylvania.

Sundry Employments. The hours of labor of drug clerks are limited to nine per day and 108 in any two consecutive weeks in California, and to seventy hours in one week and 132 hours in two weeks in New York.

A New Jersey statute also limits the hours of labor of employees in bakeries to sixty per week.

In Arizona, work in laundries is restricted to eight hours per day; while nine hours is a day's work for telephone operators in Montana.

Eight-Hour Day. The following statement summarizes the present (1931) result of the movement for the eight-hour day: It is adopted for employment on public works by twenty-four states, the District of Columbia and for the federal government; by Delaware and Maryland for their chief cities; and by Massachusetts for municipalities adopting it in accordance with state law; for work in mines by fourteen states, and in smelters and reduction works by nine states.

WOMEN AND CHILDREN

Age and Working Time of Children. A majority of the states have laws regulating the employment of children, fixing the minimum age of employment, the maximum hours of labor per day, restricting or forbidding employment in certain occupations, and providing particularly for the safety and sanitation of their working places. Some states include adult females in their laws governing some of these details, while in others the laws as to the two classes are separate. The power of the state to regulate the employment of children is unquestioned.

The table on page 1075 shows the age below which employment of children in industry is unlawful, the age to which the indicated protection in the matter of the length of the working day applies, the daily hours of labor permitted, and the restrictions as to night work, if any. The restrictions set forth in the table mentioned are relaxed in a number of states where the child has a widowed mother, invalid parents, or is dependent on its own efforts for support. Relaxation of the law on one or more of these grounds is found in the states of Arkansas, California, Colorado, Delaware, Florida, Georgia, Idaho, Louisiana, Michigan, Montana, Nebraska, Nevada, South Carolina, South Dakota, Texas, Vermont, Washington and West Virginia.

Hazardous or Injurious Employments. Danger to life, limb or health, and exposure to immoral or otherwise injurious influences are reasons for forbidding the employment of children in certain occupations. Thus employment in mines is the subject of special laws in some states, though it is more commonly included with other industrial employment. Work with or about designated forms or classes of dangerous machinery or in certain hazardous employments, or employments injurious or dangerous to health or morals, is forbidden by nearly every state, mostly by a standardized form of law fixing sixteen years as the age below which the designated forms of employment are forbidden. Such laws are found in all the states except Georgia, Mississippi, New Hampshire, New Mexico, North Carolina, Oregon and South Carolina. In Louisiana the age limit is fourteen years; in Texas, seventeen, and in Maryland, Michigan, Nevada, and Washington, eighteen years. Employments injurious to morals, including acrobatic and mendicant occupations, are forbidden by the laws of most states, with the same or slightly varying age limits. Twenty-three states regulate street trades, such as the sale of newspapers, shoe blacking and messenger service, by special laws fixing a minimum age limit, requiring registration, procuring badges, and limiting the time of employment so as not to interfere with school hours or permit late night work.

Hours of Labor of Women. Although women have equal rights with men as to the making of contracts and suffrage, their physical structure and a regard to the welfare of the race warrant limitations as to their employment which would not be valid as to that of adult males. Thus their hours of labor are limited by several states, and laws of this sort are constitutional. The limit of employment is eight hours per day in Arizona, California, Colorado, District of Columbia, Montana, Nevada, New Mexico, New York, Utah and Washington; eight and one-half in

North Dakota and Wyoming; nine in Arkansas, Idaho, Kansas, Maine, Massachusetts, Michigan, Missouri, Nebraska, Ohio, Oklahoma, Oregon, Texas and Wisconsin; ten in Connecticut, Delaware, Georgia, Illinois, Kentucky, Louisiana, Maryland, Minnesota, Mississippi, New Jersey, Pennsylvania, Rhode Island, South Carolina, South Dakota and Virginia; ten and one-fourth hours in New Hampshire; ten and one-half in Tennessee and Vermont; eleven in North Carolina; and no limit in Alabama, Florida, Indiana, Iowa and West Virginia. In some of these states the total number of hours per week allowed is less than six times the maximum per day. This results in the following limitations: forty-eight hours per week in Massachusetts and Oregon; forty-nine and one-half in Kansas; fifty in Ohio and Wisconsin; fifty-four in New Hampshire, New Jersey, Pennsylvania and South Dakota; fifty-five in Connecticut, Delaware, Rhode Island and South Carolina; fifty-six in Vermont; fifty-eight in Minnesota; and sixty in North Carolina. Seven times the daily maximum is permitted in Colorado, Idaho, Illinois, Montana, Nevada, New Mexico, Virginia, Washington and Wyoming. Night work (10 P.M. to 6 A.M.) is forbidden in Connecticut, Delaware, Indiana (manufacturing), Massachusetts (manufacturing), Nebraska, New Jersey, New York (manufacturing) and Pennsylvania (manufacturing); between 6 P.M. and 6 A.M. in Massachusetts in textile factories; between 10 P.M. and 7 A.M. in New York in mercantile establishments, and after 10 P.M. in South Carolina in mercantile establishments.

Female employees are to be supplied with seats and allowed such use of them as their employment will reasonably permit, according to laws of the District of Columbia, and of every state in the Union except Mississippi, New Mexico and North Dakota.

EMPLOYERS' LIABILITY FOR INJURIES TO EMPLOYEES

Common Law Rule. At common law the employer is charged with the exercise of a reasonable degree of care for the safety of his workmen, which failing, he becomes responsible for the injuries resulting from his neglect. What such degree of care is depends upon the nature of the undertaking, more hazardous ones involving a greater degree, and vice versa. The measure is generally said to be that degree of care that a reasonably prudent man would take to protect himself in like circumstances. Tools and appliances must be reasonably safe and suitably adapted to their intended use. The same test applies to the working place, though the employer is held to a stricter accountability for this than for the condition of appliances. At common law an employer may, in general, carry on his business in his own way provided the employee is capable of contracting and knows and appreciates the dangers of the situation. He must not use unreasonably dangerous methods or appliances, however, and it has been said that dangerous work should be undertaken only after the adoption of all known reasonable precautions.

Statutes Fixing Standard of Care. Factory inspection laws, railroad safety appliance laws, mine regulations and the like, address themselves to the standard of safety to be secured by the employer, and in so far restrict the freedom allowed him by the common law in this respect. When the law fixes such a standard, it is negligence to come short of it, and an employer doing so will generally be liable in damages for the resultant injury, if any. In some states the courts allow the plea of assumed risks in such cases, though the better rule is to the contrary. Maintenance and repair stand on the same footing as the original provision, and the Supreme Court has held that the duty of conforming to the provisions of the federal law as to drawheads and automatic couplers on railroad trains is an absolute one, and that the exercise of ordinary care is not sufficient to excuse a failure in this regard.

Defenses. An employer sued for damages for injuries to an employee may offer, in defense, that the workman assumed the risks of the undertaking; that the injury was the result of the negligence of a fellow-servant; or that, even if the employer was himself negligent, the employee by his own contributory negligence was in such measure responsible for the injury as to relieve the employer from liability therefor. The risks assumed are those arising from the ordinary incidents of employment, of which the workman was aware or which he could have known if he had exercised ordinary care, and existing after the employer has performed his duty as to the exercise of care in behalf of his employees. This includes the risk of injury from the negligent acts of fellow-servants who have been selected with ordinary care. An employee who represents the employer is not a fellow-servant to his subordinates. Where the employee's own negligence contributed to the injury, no attempt will ordinarily be made to apportion fault and make a partial award of damages, but any degree of contributory negligence will vitiate entirely the claim of the injured person.

Statutes Affecting Defenses. These defenses have been modified or abrogated by numerous statutes to such an extent that, as was recently said by a justice of the Supreme Court, there is hardly a jurisdiction in which they exist unmodified. Thus, the laws of Arizona, Colorado and Rhode Island (if more than five employees) abrogate entirely the defense of fellow-service; while a number of states have done away with it in its application to railroad employment, to mine labor, or to occupations in general. The British employers' liability law of 1880 is a pattern for laws enacted in several states, specifically charging liability for defects in the condition of ways, works or machinery; for the negligence of employees exercising superintendence or giving orders; and for the acts of certain employees on railroads. The principal effect of these laws is in changing the rule as to fellow-service. They exist in Alabama, Arkansas, California, Colorado, District of Columbia, Georgia, Indiana, Iowa, Kansas, Kentucky, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oregon, Pennsylvania, South Carolina, South Dakota, Texas, Virginia, Wisconsin and Wyoming.

The modification or abrogation of the other defenses is sometimes general, but is more frequently connected with statutes prescribing safety appliances, the employer not being allowed to plead these defenses where he fails to conform to the provisions of the statute. Instead of allowing the contributory negligence of the injured employee to bar him entirely from recovery of damages, the federal liability law and a number of state laws embody a doctrine of comparative negligence, by virtue of which there is to be an admeasurement of the negligence of the employer and the contributory negligence of the employee, and where the former is gross in comparison with the latter, damages shall not be entirely withheld, but only reduced proportionally. Such laws are found in Arkansas, California, District of Columbia, Iowa, Kansas, Kentucky, Michigan, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Mexico, North Carolina, North Dakota, Ohio, Oregon, South Carolina, South Dakota, Texas, Virginia, Washington, Wisconsin and Wyoming, and in a modified form in Georgia. All these laws are of recent enactment, but the principle has been held to be constitutional.

Employees' Waivers. Employers frequently secure contracts from their employees waiving their rights to damages for injuries due to the former's negligence. Courts construe such contracts diversely, and a number of state statutes and the federal statute above mentioned prohibit them, either generally, or in connection with statutes charging a particular duty. The states having such laws are Alabama, Arizona, Arkansas, California, Colorado, District of Columbia, Florida, Georgia, Indiana, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, South Carolina, South Dakota, Texas, Virginia, Washington, Wisconsin and Wyoming. Such laws have been declared constitutional.

Relief Systems. Employers, either singly or in association, may organize systems of relief available for employees injured in the course of employment. These funds may be supplied entirely by the employer, the benefits being available to all employees, or they may be supplied by the employer and employee jointly, only those employees being entitled to benefits who become members of the association and contribute to its funds. The acceptance of benefits is usually made a bar to suits for damages, and the bringing of a suit likewise cuts off the benefits. Agreements that acceptance shall so operate, if made in advance of the receipt of the injury, are commonly construed as only putting the employee to his election whether to accept the benefits, or sue, and are valid only to that extent. Several statutes do not permit the receipt of benefits to go further than to effect a reduction of the amount of the judgment against the employer in proportion to the amount of his contribution to the benefit fund, or they may permit the employer to set off against a judgment any sum or indemnity paid from a fund to which he has contributed. Such provisions are found in connection with a number of the laws forbidding waivers, noted above, including the Federal statute.

Workmen's Compensation. As distinguished from the system of liability, in

which the employee must prove the employer to have been at fault, is the method of compensation covering not only accidents caused by the fault of the employer, but also those that are the result merely of the trade risk, frequently called inevitable, the burden of which is, under the liability system, assumed by the party least able to bear it, that is, the workman. Most industrial countries other than the United States had adopted compensation as the method of dealing with industrial accidents at a time when the liability system was still in use in this country.

Laborers and artisans employed by the United States were granted compensation in a limited degree by an act of August 1, 1908, superseded by a much more adequate statute enacted in 1916, covering civilian employees of the United States generally. Rudimentary beginnings of state legislation were made as early as 1902, but the year 1911 is the earliest date of enactment of any statute embodying the characteristic features of existing legislation of this type in this country. At the beginning of the year 1930 but four states of the Union, South Carolina, Florida, Mississippi and Arkansas, were without legislation of this type. The last-named state has a law covering employees of the state highway commission injured or killed in course of employment.

The fundamental distinction between compensation and liability statutes is that the former provide relief for industrial accidents (and diseases as well in many jurisdictions) on the basis of the employment relation, and without regard to questions of fault as primarily decisive, while in the latter the question of negligence on the part of the employer is basic. The injury for which compensation is claimed must have been received in the course of the employment and as an incident thereto; or as the customary phrase reads, must "arise out of and in the course of the employment." The laws of a few states do not require that both conditions shall exist, but the rule is very general.

Benefits are payable at a fixed rate, which is in most states a percentage of the wages of the injured employee, ranging from fifty per cent in about one-third of the states, to sixty-five or sixty-six and two-thirds per cent in more than one-third. There is a constant tendency toward the more liberal rates, so that what is true at a given period may be incorrect at a later date. Indeed, a striking feature of this legislation is the fact of frequent amendments, in some states hardly a session of the legislature having passed since the original enactment of a state compensation law without some modification of its provisions. Payments are in most cases made weekly, corresponding to the more prevalent mode of wage payment, though in Oregon, Washington, West Virginia and Wyoming, monthly payments not based on wages are allowed in some classes of cases, and in Wyoming fixed lump sums are payable except for temporary total disability. The payment of lump sums is as a rule discouraged on account of the danger of loss of investments by persons not accustomed to handling funds other than a regular sum of nearly uniform amount.

The most common injuries are those that cause a passing disability for service, known as temporary total disabilities; if a member is lost or destroyed, or the use of some part of the body permanently impaired, the result is classed as a permanent partial disability; or if the entire earning power is destroyed, the injury is classed as permanent total. Most states have schedules providing a fixed number of weekly payments for cases of permanent partial disability due to loss of a member or loss of use of a member, as leg, hand, eye or finger. A few recognize the greater economic burden resulting from permanent total disability than that resulting from death by providing compensation at a higher rate in such cases.

In death cases, payments are due only to dependents and not to estates or next of kin, as in cases of suits for damages. A common provision of law is that dependency is determinable as of the date of the injury resulting in death, but this does not exclude children born after the death of the father. Members of the family are quite generally provided for, but usually by naming the classes covered, as parents, grandparents, children and grandchildren. Benefits to widows terminate on death or remarriage, though in the latter case a lump sum is granted equal to one or two years' payments according to the laws of several states. It is also generally provided that children's benefits are increased in event of the death or remarriage of the surviving parent. On account of a provision of its constitution, the law of Oklahoma provides no compensation in case of death.

The amount payable weekly is limited, first by the amount of the worker's earnings, and secondly by a fixed maximum in nearly every state; a minimum is also fixed in all but one state. This maximum ranges from $12 to $25 weekly, but, like other features of this legislation, changes of amount are so frequent that no permanent list of states and rates can be attempted. The minimum is not allowed to exceed actual earnings.

Another limitation usually found is in the total amount or total period of payments. Death benefits run in some states for the lifetime of a widow, though in most both the term and total amount are limited. The lowest aggregate is $3,000, and the highest fixed amount is $7,500 for death; for permanent total disability $8,000 and $10,000 maximum totals are provided in two states. In a few states no limits of time or amount are fixed.

Every compensation statute provides for medical, surgical and other relief for injured workers, either according to the necessities of the case, or within fixed limits of time and amount. Such services are to be provided immediately, while payments of compensation, except in two states, are due only if disability continues beyond a fixed minimum period, commonly known as "waiting time." This waiting time ranges from three days to two weeks, one week being the most common period fixed.

Agriculture and domestic service are almost universally excluded from the terms of these laws, and in a minority of the states only designated "hazardous" employments are covered. Employers of small numbers of employees are exempt in several states, one state requiring sixteen, and six states requiring ten or more employees for inclusion at the date of this writing (1931). Public employees, state or municipal, are included in nearly all laws.

In a majority of the states acceptance of the compensation system is said to be elective, but the abrogation of the employers' customary defenses of fellow-service, contributory negligence and assumption of risks in case of failure to elect offers a strong inducement to accept the terms of the acts, which is usually presumed in the absence of positive action to the contrary. Employers accepting the compensation system can not be sued for damages. Employers under compensation laws must usually insure the payment of benefits as they become due by taking out policies in approved insurance companies, or by furnishing satisfactory evidence of financial responsibility. Nearly a score of laws provide for state insurance funds to carry these risks. A majority of them work in competition with private companies, while the others offer the state fund as the only recourse allowed the employer for this service.

In a few states the question of administering these laws and adjusting claims is left to the courts, but by far the most common method is for a special board or commission (a single commissioner in a few states) to be provided by the act establishing the system. Appeals to courts may usually be taken from the findings of these agencies, but often only on questions of law, decisions as to questions of fact being final. Reports of accidents are to be made to these bodies, and in some states they are also charged with the duty of accident prevention.

The history of labor legislation shows no other such rapid and general acceptance of a principle so decidedly divergent from that which it supplanted. Besides the four states named above as not yet having compensation laws, the conspicuous exception is transportation, railroad employees and seamen being the two great bodies of workers in so-called hazardous employments not now covered by such laws. One class of maritime employees —longshoremen and mechanics, laborers and artisans engaged in maritime employments— is the subject of a federal statute of 1927, giving them exclusive compensation benefits unless the injury is due to the negligence of a third party, when an option to sue is granted. An attempt to include all maritime workers under this statute was opposed by the International Seamen's Union. Similarly, certain influential unions of railroad workers have thus far been able to prevent the enactment of a law applicable to them, though other groups favor it, and it is hardly open to dispute that the liability system causes constant loss to the workers and continues in effect in this field an almost universally discredited system.

PHYSICAL CONDITIONS OF EMPLOYMENT

Factories. The rule of common law, that the employer is to use ordinary care for the safety of his workmen, is supplemented or superseded in many states by laws fixing a standard of safety, or prescribing the use of certain protective appliances. Thus fire escapes on factories and other places of employment are required in most jurisdictions

of the United States, and in a number the use of doors that open outwardly, or of sliding doors, is directed.

Every state makes provision in some degree for the safety of workers in such places as factories, workshops and mercantile establishments, as by requiring dangerous machinery to be guarded; belt shifters, switches and cut-offs for the prompt and safe starting and stopping of machinery to be provided; barriers or guards to be maintained about elevator shafts, well-holes and vats of hot liquid or molten metal; ventilation and sanitation to be adequate in establishments where offensive or injurious dusts, gases or odors are generated. Regulations relate to such items as heating, lighting, air space, the scrubbing of floors, washing, painting or whitewashing of walls, a supply of separate toilets and washrooms for the sexes, lockers for changes of clothing, the use and storage of inflammables and explosives, the age limit of passenger elevator operators. The states differ widely in respect to the completeness of such regulation, the more industrially developed being naturally those in which the fullest detail of legislation is found.

The taking of food into workrooms where poisonous dusts or gases may affect it is restricted or forbidden by laws of Delaware, Illinois, Minnesota, Missouri, New Jersey, New York, Ohio, Pennsylvania and West Virginia.

Sweat Shops. Sweat shops or tenement factories are regulated by special laws in Connecticut, Illinois, Indiana, Maryland, Massachusetts, Michigan, Missouri, New Jersey, New York, Ohio, Pennsylvania, Tennessee and Wisconsin. These laws may prescribe the amount of air space, light, ventilation, sanitation and safety, and in some states require licenses and registration of all workrooms used for such purposes, or lists of all persons to whom work is given out, with their place of residence.

Food Products Establishments. Bakeries, confectionaries and other places where food products are made or handled are subjects of specific regulations in some states, partly for the benefit of the workmen employed therein, and partly for the sake of the public health. The states having such laws are California, Colorado, Connecticut, Delaware, Georgia, Idaho, Illinois, Indiana, Iowa, Kentucky, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Jersey, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Dakota, Tennessee, Texas, Washington, Wisconsin and Wyoming.

A number of these laws forbid the use of cellars or basements below a certain level, prohibit sleeping in shop or storage rooms, and forbid the employment of persons affected with tuberculous or other infectious or contagious diseases.

Man Power 18,000 Strong

This picture shows but a part of the army of employees of a great industrial plant. The men have just come from the buildings at closing time.

In most states which have these laws, their enforcement is intrusted to officers appointed or elected for the purpose; in a few, however, it is in the hands of the ordinary law-enforcement officers, in which case not much can usually be said as to the efficiency of enforcement. In a few states the inspection of bakeries, confectionaries and food products establishments is placed in the hands of health officers.

Mines. The operation of mines is regulated in thirty-five states—which practically constitutes all the states having mines—and by federal statute for the territories. These laws contain requirements that maps of all workings shall be prepared and filed with an officer of the state; that escape shafts shall be provided; that travel ways be timbered and lighted and safety holes or places of refuge from passing cars supplied; and that timbers for the use of men in their working places be provided in suitable lengths and amounts. Blasting, including drilling, tamping, and the firing of shots may be regulated, as well as the opening and storage of boxes of explosives, the storage of oil, hay and other inflammables, and the insulation of electric wires. Methods of working, ventilation, the construction and protection of hoisting shafts and cages, the use of safety lamps, the employment of qualified foremen, fire-bosses and shot-firers, the daily inspection of dangerous places, and other details are embraced in these laws with greater or less completeness. Except in California, Oregon and the territories (which are under the control of federal inspectors), the commonwealths having mining laws have state officials specially charged with their enforcement.

Railroads. The provision of train brakes subject to the control of the engineer, safety couplers, grab-irons, switch signals, the blocking of frogs, the placing of telltales or warning strings at the approach to bridges and tunnel roofs above the track and the distance of structures from the tracks are matters of regulation affecting the railroads of many states. A few states also require the block system of operating trains to be used. A number prescribe the candle power of the locomotive headlight. Under the terms of some state laws, certain classes of employees must be examined for color blindness, literacy and experience.

State laws must give way to federal enactment, so far as interstate traffic is concerned, in whatever detail Congress acts; furthermore, state laws may not undertake to supplement or perfect the provisions prescribed by the federal authorities in their field. The fact remains that practically every state in the Union has enacted laws addressed to some one or more of the points enumerated above, and many provide for special enforcement agencies to insure the observance of these laws.

The construction of caboose cars has been specially legislated on in Arkansas, Illinois, Indiana, Iowa, Kansas, Maine, Michigan, Minnesota, Missouri, Montana, Nebraska, New Hampshire, New York, North Dakota, Ohio, South Dakota, Vermont, Virginia, Washington and Wisconsin. The laws usually prescribe the length of the car, its equipment with double trucks, platforms with guard rails and steps, and other provisions for the safety and comfort of the train crew. A number of states designate the minimum train crew that may be employed; Arizona, Arkansas, California, Connecticut, Maine, Maryland, Massachusetts, Nebraska, Nevada, New York, North Dakota, Ohio, Oregon, South Carolina, Texas, Washington and Wisconsin have laws of this sort. Shelters over repair tracks are prescribed in Arkansas, California, Illinois, Kansas, Mississippi, North Carolina, North Dakota, Oklahoma, Oregon, South Carolina, Texas and Virginia.

Street railway employees are protected by laws requiring the platforms on which motormen stand to be inclosed, either all the year, or during the winter months. Such laws exist in Colorado, Connecticut, Delaware, District of Columbia, Illinois, Indiana, Iowa, Kansas, Louisiana, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, New Hampshire, New Jersey, New York, North Carolina, Ohio, Oregon, South Carolina, Tennessee, Utah, Virginia, Washington, West Virginia and Wisconsin. Power brakes or other adequate brakes are prescribed, either for all street cars or for those of designated types or weight, in California, Connecticut, Iowa, Montana, New Hampshire, Ohio, Vermont, Washington and

Wisconsin. In Connecticut, Louisiana, Missouri, New Jersey, Ohio, Oregon and Vermont seats are to be furnished drivers or motormen on street railways.

Building Operations. The erection, destruction and repair of buildings expose workmen to hazards against which employers are required by law to furnish protection in a number of states. These laws relate to the construction, strength, barricading and, in a few states, to the shielding of scaffolds; to the laying of permanent or temporary flooring or the placing of secondary scaffolds as the building progresses; to the guarding of hoistways or shafts; to the construction and operation of hoists and cranes, and to the protection of workmen from falling objects. These provisions are more or less fully embodied in laws of California, Connecticut, Delaware, Illinois, Indiana, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Minnesota, Missouri, Montana, Nebraska, Nevada, New York, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, Texas, Washington, West Virginia and Wisconsin.

Accidents. The reporting of accidents took on a new importance with the enactment of compensation laws, inasmuch as most states require the reporting of compensable accidents to a state commission or like agency for administrative purposes. Nearly every state, however, has accident reporting laws independent of compensation statutes, most numerous being those which apply to public utilities generally or to railroads in particular. It will be recalled that the federal railroad law calls for reports of accidents to the Interstate Commerce Commission, but the state laws still stand, twenty-five having laws specifically naming railroads, while thirteen others include them with other public utilities. A majority of the states with mining laws require reports of mine accidents, while eight specify injuries in factories, and fourteen industrial injuries generally, not including railroads. In many laws authority is given for investigation by a state official, usually at his discretion.

These laws lack much in the way of uniformity, some applying only to fatal or otherwise serious injuries, several to those which cause disability for two weeks or more, and one to only those establishments in which children, young persons or women are employed. It follows that the reports of the different states lack much in comparableness and in actual presentation of the losses due to injuries.

Accident prevention is a function of many compensation commissions and state labor bureaus, and is prescribed as a duty of mine inspectors in Alabama, Arizona, Colorado, Idaho, Illinois, Iowa, Kentucky, Maryland, Minnesota, Montana, Nevada, New Mexico, Oklahoma, Pennsylvania, South Dakota, Texas, Washington, West Virginia and Wyoming.

RESTRICTIONS ON EMPLOYMENT

General Restrictions. Either the public welfare or the safety of the workman and his co-employees may warrant a preliminary determination of his fitness to engage in certain kinds of labor. To this end examinations and registration of persons wishing to engage in such occupations may be required. Color blindness of men employed in certain capacities on railroads, and infectious or contagious diseases where personal contacts are involved, as well as lack of skill, are illustrations of disqualifications for service. Laws requiring evidence of qualification, and usually registration as well, are found in a number of states, as follows:

For employees on railroads, in Alabama, Arizona, California, Georgia, Idaho, Indiana, Massachusetts, Michigan, Missouri, Nebraska, New York, Ohio, Oregon, Washington and Wisconsin; for motormen on street railways, in Louisiana, New York and Washington; for steam engineers, either generally or in designated capacities, in District of Columbia, Florida, Georgia, Maryland, Massachusetts, Minnesota, Missouri, Montana, Nevada, New Jersey, New York, Ohio, Pennsylvania, Washington, and by federal statute; for stationary firemen, in Georgia, Massachusetts, Montana and New York; for elevator operators in Minnesota; for mine managers or foremen, fire bosses and others in mines, in Alabama, Arkansas, Colorado, Illinois, Indiana, Iowa, Kansas, Kentucky, Missouri, Montana, North Dakota, Ohio, Oklahoma, Pennsylvania, Tennessee, Utah, Virginia, Washington, West Virginia and Wyoming; for all miners in Illinois, Indiana and Missouri, and for anthracite miners in Pennsylvania, while only experienced miners may work alone in Montana, North Dakota, Ohio and Virginia, and in bituminous mines in Pennsylvania; for plumbers in Arkansas, Colorado, Delaware, District of Columbia, Florida, Illinois, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Missouri, Montana, Nebraska, New Hampshire, New York, Oklahoma, Oregon, Pennsylvania, South Carolina, Tennessee, Texas and Wisconsin (such a law was declared unconstitutional in California and Washington); for electricians in Massachusetts, Minnesota, North Dakota, Tennessee and Washington (such a law has been declared unconstitutional in Louisiana); for horseshoers in Illinois, Maryland, Michigan and Minnesota (declared unconstitutional in Illinois, New York and Washington); for barbers in California, Colorado, Connecticut, Delaware, Georgia, Idaho, Illinois, Iowa, Kansas, Maryland, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Oregon, Rhode Island, South Dakota, Utah, Washington and Wisconsin; for beauty parlor managers, operators and apprentices in Arkansas, California, Connecticut, Illinois, Iowa, Kansas, Louisiana, Minnesota, Missouri, New Mexico, North Dakota, Oregon, Rhode Island, South Dakota, Utah, Washington and Wisconsin; for moving picture machine operators in Maine, Maryland, Massachusetts, Michigan, New Jersey, New York, Rhode Island and South Dakota, and for chauffeurs in nearly all states.

Alien Labor. An argument in support of legislation of the kind above noted is that it limits competition, particularly of unskilled or unqualified labor. The federal Chinese Exclusion Acts and the acts forbidding the importation of immigrant laborers under contract are designed directly to limit competition of a sort especially likely to lower rates of wages and the standard of living. The employment of aliens on public works is prohibited, or a preference for citizens expressed, by statutes of Arizona, California, Idaho, Massachusetts, Nevada, New Jersey, New York, Oregon, Pennsylvania, Utah and Wyoming.

Convict Labor. The same reasons operate to restrict convict labor and to prevent or limit its output and the sale of convict labor products in the open market. Such laws are not directly labor laws, and the effort to regulate the sale of the goods after they once become the subject of commerce, and particularly of interstate commerce, has generally been found to be beyond the power of state legislatures. However, Congress, in 1929, enacted a law, in effect after five years, subjecting convict-made goods to the control of local laws on their arrival in any state or territory for consumption or sale.

MEDIUMS FOR SECURING EMPLOYMENT

Employment Offices conducted by the state, rendering free services to persons seeking employment and to employers wishing to hire employees, are provided for by statutes of Arizona, Arkansas, California, Colorado, Connecticut, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, North Carolina, North Dakota, Ohio, Oklahoma, Pennsylvania, Rhode Island, South Dakota, Utah, Virginia, West Virginia and Wisconsin. Central and branch offices are provided for in some of these states with weekly or otherwise periodical exchanges of lists of applications. A federal statute provides for similar service in coöperation with state agencies.

Private Employment Offices are now regulated by statute in nearly every state; these statutes may fix the rate of charges, require receipts to be given and open registers to be kept, prohibit the conduct of business in connection with boarding houses or places of improper character, require evidence of bona fide vacancies, provide penalties for fraud or for sending females to places of immoral resort, require a license, for which a fee is charged, and otherwise regulate the conduct of the business. Laws of this nature exist in the District of Columbia and in all states except Alabama, Delaware, New Mexico, South Carolina and Vermont. The provision limiting fees was declared unconstitutional in California, as unwarrantably interfering with the freedom of contract; and a law of New Jersey authorizing the state commissioner of labor to approve schedules of charges was held by the Supreme Court of the United States to be void because in conflict with the due process clause of the Constitution and not warranted by the public interest.

Bureaus of Labor. Bureaus or departments of the state government charged with the duty of administering the laws relative to labor, including the inspection of factories and other working places, the collection of labor statistics, the investigation and mediation of labor disputes, and of seeking to further the interest of industrial workers and industry generally, are provided for by statutes of most states, though with considerable variety in the matter of authority and scope of action. In some states an industrial commission is

charged with such duties, and may include powers distributed among two or more agencies in other jurisdictions. Laws of these types are found in all states except Alabama (has a child welfare department to enforce laws regulating the employment of children), Florida and New Mexico. There is also a federal office charged with such of these duties as are appropriate.

LABOR ORGANIZATIONS

Right of Labor to Organize. Labor organizations may incorporate under the general corporation laws of a state applicable to associations of like nature; in a number of states, however, and by federal statute, provision is made by special laws for their incorporation. The states are Iowa, Kansas, Louisiana, Massachusetts, Michigan, New York, Ohio, Pennsylvania, Texas and Wyoming. That labor agreements are not conspiracies is declared by statute in California, Colorado, Maryland, Minnesota, Nevada, New Hampshire, New Jersey, New York, North Dakota, Oklahoma, Pennsylvania, Texas, Utah and West Virginia. Statutes applicable to labor organizations, but not restricted to them, are found in most states, giving to unincorporated associations a right to sue or be sued with reference to their funds. Statutes also determine in general how actions affecting such associations may be brought.

The badges, cards or insignia of labor organizations are protected from unwarranted or fraudulent use by laws of California, Connecticut, Georgia, Massachusetts, Minnesota, New York, Oregon, Pennsylvania, Rhode Island, Texas, Virginia and Wisconsin. The union label is protected from imitation or fraudulent or unauthorized use in forty-three states. Montana and Nevada have laws directing that public printing shall bear the union label; such laws have generally been held unconstitutional.

Laws prohibiting discrimination against workmen on account of their membership in labor organizations, either by discharging them or requiring them to agree not to join, have been enacted by the legislatures of several states and by Congress, but wherever a test has been made of this law in the higher courts, it has been declared unconstitutional, and it has been so held by the Supreme Court. Laws of this sort still stand on the statute books of Connecticut, Idaho, Indiana, Louisiana, Massachusetts, Mississippi (for telegraph operators only), New Hampshire, New Jersey, New York, Oregon and South Carolina. A Wisconsin statute declares void any contract not to join a labor organization during the term of employment. Laws addressed to labor organizations and forbidding them to discriminate against members or applicants for membership on account of their belonging to or joining the National Guard are found in Arizona, California, Florida, Illinois, Kansas, Maine, Massachusetts, Michigan, Mississippi, New Jersey, New Mexico, New York, Ohio, Oklahoma, South Carolina, Washington and Wisconsin.

Labor organizations are specifically exempted from the operation of anti-trust laws in California, Colorado, Iowa, Louisiana, Michigan, Montana, New Hampshire, New Mexico, Virginia and Wisconsin; of insurance laws in Massachusetts, and of laws governing beneficial associations in Kansas. Laws of Maine and New Jersey authorize them to take out collective insurance in behalf of their members, for which insurance companies may also make special rates. The bribery of representatives of labor organizations is specially penalized by statutes of Nevada, New Jersey, New York and Virginia.

Rights of Labor to Strike. Though strikes are legal everywhere under the common law as construed in this country, the Congress of the United States has passed a law specifically declaring their legality; while state laws which declare labor agreements not conspiracy are of the same practical effect. In Minnesota it is declared that the fact of engaging in a strike more than one year prior to hiring shall not be made the subject of inquiry in employing workmen. Where employers advertise for workmen while there is a strike in their establishment, the fact must be stated in the advertisement, according to laws of California, Colorado, Illinois, Massachusetts, Montana, New Hampshire, North Dakota, Oklahoma, Oregon, Pennsylvania, South Dakota, Tennessee, Texas and Wisconsin.

Several states have laws to direct the conduct of strikers where the operation of railroads is affected. These laws prohibit the obstruction of the operation of trains, the intimidation of employees on trains, and the abandonment of engines or trains at other than division points or the point of regular schedule destination. These provisions are found partly or in their entirety in laws of Connecticut, Delaware, Georgia, Illinois, Kansas, Kentucky, Maine, Mississippi, New Jersey, Ohio, Pennsylvania and Texas. The Maine statute covers other public service corporations as well as railroads.

Rights of Labor to Picket, Boycott and Blacklist. Five states—Alabama, Colorado, Kansas, Nebraska and Utah—prohibit picketing. The act of Congress which declares strikes legal also authorizes any person to attend "at any place where any such person or persons may lawfully be, for the purpose of peacefully obtaining or communicating information." Nor may an injunction issue against "peacefully persuading any person to work or to abstain from working." This is the so called Clayton Act, under which it has been held by the Supreme Court that "picketing was unlawful, and that it might be enjoined as such, and that peaceful picketing is a contradiction in terms which the statute sedulously avoided." Boycotts are declared unlawful by laws of Alabama, Colorado, Connecticut, Illinois, Indiana, Kansas and Texas. Blacklisting is prohibited by statutes of Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Florida, Illinois, Indiana, Iowa, Kansas, Minnesota, Mississippi (telegraph operators only), Missouri, Montana, Nevada, New Mexico, North Carolina, North Dakota, Oklahoma, Oregon, Texas, Utah, Virginia, Washington and Wisconsin. Intimidation or other interference with employment is prohibited under penalty in Alabama, Arkansas, Colorado, Connecticut, Delaware, Florida, Georgia, Idaho, Illinois, Kansas, Kentucky, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New York, North Dakota, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Dakota, Texas, Utah, Vermont, Washington, West Virginia and Wisconsin. Conspiracy against employees is specifically forbidden in Alabama, Florida, Georgia, Kansas, Minnesota, Mississippi, Nevada, New York, North Dakota, Texas and Washington.

Arbitration of Labor Disputes. Provision for conciliation or arbitration in cases of disputes between employers and employees through the instrumentality of agencies, either existing as permanent state offices, boards or commissions, or appointed locally for the occasion, exists in most states of the Union, and by federal enactment. When special boards are to be appointed, it is frequently provided that one member shall be named by the employer, one by the labor union representing the employees, and the third by these two. State or local officials may offer their services as mediators, or may convey information to standing boards as to the existence or threatened occurrence of a strike, whereupon mediation may be attempted or arbitration proposed. Investigations may be made and the results published, but arbitration can not be enforced upon an unwilling party. Awards may be made a matter of record as of a finding of a court in some states. State boards or offices are provided for by laws of Alabama, Connecticut, Illinois, Indiana, Iowa (for the occasion only), Louisiana, Maine, Massachusetts, Michigan, Missouri, Montana, New Hampshire, Oklahoma, Oregon, South Carolina, Texas, Utah and Wisconsin. Other state agencies are charged with like duties in Arizona, Arkansas, Colorado, Georgia, Kansas, Maryland, Minnesota, Nebraska, Nevada, New York, Ohio, Pennsylvania, South Dakota, Vermont, Washington and West Virginia. Provision is made for local boards in Alabama, Colorado, Kansas, Maine, Maryland, Massachusetts, Michigan, Montana, Nevada, New Jersey, Ohio, Texas and Wyoming. It will be noted that in most of these states, state agencies also exist.

A federal statute creates a permanent Board of Mediation appointed by the President, whose office it is to promote the adjustment of disputes between common carriers engaged in interstate commerce and their employees, as to rate of pay, rules, working conditions and so forth. Boards of adjustment may be created by agreement of the parties to a dispute to act for designated groups in the circumstances provided for in the agreement entered upon. Boards of arbitration may also be formed, if agreed to by the parties after efforts to mediate have not arrived at a settlement. Still another agency provided for is that of emergency boards, to be appointed by the President in event that the Board of Mediation finds an unadjusted controversy likely to deprive any section of the country of essential transportation service.

It is significant that there are many portents of a better relation between organized labor and employing capital. Threats of business depression are not always being met by attempts at wage cutting, indicating a growing realization that prosperity requires a suitable wage scale.

COMPULSORY EDUCATION AND CHILD LABOR LAWS

Statutory provisions relating to compulsory attendance and child labor, prepared by the United States Bureau of Education.

	Compulsory Education			Child Labor
State	Age	Annual Period	Penalty on Parents for Neglect	Age Under Which Specified Employments Are Forbidden
Alabama	8–16	Full term.	Amount not stated; collection enforced by imprisonment.	14 years, in any gainful occupation.
Arizona	8–16	Eight months.	$5 to $50 or imprisonment 1 to 25 days or both.	14 years, in factories, stores, etc.; any business during school hours.
Arkansas	7–15	Three-fourths of term.	$10 maximum.	14 years, in any remunerative occupation.
California	8–16	Full term.	First, not over $10 or 5 days' imprisonment; subsequent, $10 to $50 or 5 to 25 days or both.	15 years, in any place of employment.
Colorado	8–16	Full term.	$5 to $25 or imprisonment, 10 to 30 days.	14 years, in any gainful occupation.
Connecticut	7–16	Full term.	Not exceeding $5.	14 years, in any mechanical, mercantile, or manufacturing establishment.
Delaware	7–17	Full term.	First, $5 to $25; subsequent, not over $50. On default, imprisonment.	14 years, in any establishment or occupation.
District of Columbia	7–16	Full term.	$10 or 5 days in jail or both.	14 years, in any gainful occupation.
Florida	7–16	"Substantially" full term.	Not over $5 or imprisonment not over 5 days.	14 years, in factories; 12 in stores.
Georgia	8–14	Six months.	$10 first offense; $20 subsequent offenses.	14 years, in or about any manufacturing establishment.
Idaho	8–18	Full term.	As fixed by court.	14 years, in factories, mercantile establishments, etc.
Illinois	7–16	Full term.	$5 to $20.	14 years, in any gainful occupation.
Indiana	7–16	Full term.	$10 to $200 or imprisonment not exceeding 60 days or both.	14 years, in any gainful occupation.
Iowa	7–16	Twenty-four consecutive weeks; first and second class city boards may require full term.	$5 to $20.	14 years, in any factory, mill, shop, laundry, etc., or in stores where more than 8 persons are employed.
Kansas	7–16	Full term.	$5 to $25.	14 years, in any factory, workshop or packing house.
Kentucky	7–16	Full term.	Not less than $5.	14 years, in any factory, store, office, hotel, as messenger, etc.
Louisiana	7–14	140 days or full session.	Not over $10 or 10 days in prison or both.	14 years, in any manufacturing or mercantile establishment or any other occupation.
Maine	7–17	Full term.	Not exceeding $25 or imprisonment not exceeding 30 days.	15 years, in any service for hire during school hours.
Maryland	7–17	Full term.	Not exceeding $5.	14 years, in stores, factories, canning establishments, etc.
Massachusetts	7–16	Full term	Not exceeding $20.	14 years, in factories, workshops, mercantile establishments or any work for pay during school hours.
Michigan	7–16	Full term, not over nine months	Fine of $5 to $50, or imprisonment 2 to 90 days or both.	15 years, in any manufacturing or mercantile establishment, workshop, laundry, store, office, hotel, messenger service, etc.
Minnesota	8–16	Full term, not over ten months.	Not over $50 or imprisonment not over 30 days.	14 years, in factories, mills, workshops or mines or any business during school hours.
Mississippi	7–16	Eighty days.	$1 to $10; second offense, $5 to $25; subsequent, $25 or 10 days in jail or both.	14 years, in any mill, workshop, manufacturing establishment or cannery, except fruit and vegetable canneries.
Missouri	7–16	Full term.	$10 to $25 or imprisonment 2 to 10 days or both.	14 years, in any gainful occupation.
Montana	8–16	Full term; in no case less than sixteen weeks.	$5 to $20, 10 to 30 days imprisonment.	16 years, in mines, underground works and factories, etc., where machinery is used.
Nebraska	7–16	Full term.	$5 to $100 or not over 3 months in jail.	14 years, in any manufacturing or mercantile establishment, office, hotel, etc.
Nevada	7–18	Full term.	First, not over $10 or imprisonment not over 5 days; subsequent, $10 to $50, or imprisonment 5 to 25 days or both.	14 years, in any business or service during school hours.
New Hampshire	8–16	Full term.	First, $10; subsequent, $20.	14 years, in any manufacturing establishment, store, etc.
New Jersey	7–16	Full term.	First, not over $5; subsequent, $25.	14 years, in factories, stores, workshops, mills or manufacturing establishments.
New Mexico	6–16	Full term.	$5 to $100 or imprisonment 5 to 90 days.	14 years, in any gainful occupation.
New York	7–16	Full term.	First, not over $5 or imprisonment 5 days; subsequent, not over $50 or imprisonment 30 days or both.	14 years, in factories, including canneries. Similar provisions apply, in places of over 3,000 population, to work in mercantile establishments, business offices, restaurants, hotels, etc.
N. Carolina	7–14	Full term.	$5 to $25 or 30 days in jail.	14 years, in any store, factory or manufacturing establishment, including canneries.
N. Dakota	7–17	Full term.	First, $5 to $20; subsequent, $10 to $50.	14 years, in factories, workshops, mercantile establishments, etc.
Ohio	6–18	Full term; in no case less than thirty-two weeks.	$5 to $20; on default, imprisonment 10 to 30 days.	16 years, in any factory, workshop or other employment during school hours.
Oklahoma	8–16	Two-thirds of term.	As for misdemeanor.	14 years, in factories.
Oregon	9–15	Full term.	$5 to $25 fine or imprisonment 2 to 10 days or both.	14 years, in any factory, store, workshop, in or about any mine or other employment during school hours.
Pennsylvania	8–16	Full term; but school board of each district may reduce to not less than seventy per cent of the term for pupils fourteen years of age or over.	First, $2; subsequent, $5; on default, imprisonment not over 5 days.	14 years, in any establishment or occupation.
Rhode Island	7–16	Full term.	Not fixed.	15 years, in any factory, manufacturing or business establishment.
S. Carolina	8–14	Eighty days.	$5 to $10 or 5 to 10 days in jail.	14 years, in any factory, mine or textile establishment.
S. Dakota	8–17	Full term.	$10 to $50; subsequent, $25 to $100 or 10 to 30 days in jail or both.	14 years, in mines, factories, stores, etc.
Tennessee	7–16	Full term.	First offense, $2 to $10; second, $5 to $20.	14 years, in workshops, factories, or any business which interferes with school attendance.
Texas	8–14	100 days.	$5; $10 for second; $25 subsequent.	15 years, in mills, factories, etc.
Utah	8–18	Twenty weeks, ten consecutive; in cities of the first and second class, thirty weeks, ten consecutive.	As for misdemeanor.	16 years, in mines, quarries and coal breakers.
Vermont	8–16	Full term.	$5 to $25.	14 years, in any mill, factory or cannery, etc.
Virginia	7–15	Full term.	Not over $25.	14 years, in any gainful occupation.
Washington	8–16	Full term.	Not over $25.	14 years, in factories, stores, etc.
W. Virginia	7–16	Full term.	$3 to $20 or 5 to 20 days in jail.	14 years, in any gainful occupation.
Wisconsin	7–16	Full term in first class cities; in other cities not less than eight school months, elsewhere not less than six.	$5 to $50 or imprisonment not over 3 months or both.	14 years, in factories, workshops or any gainful occupation.
Wyoming	7–16	Full term.	$5 to $25; not over 90 days in jail for subsequent offenses.	No child whose attendance at school is required by law may be employed at any service during the time the public schools are in session.

FAMOUS STATESMEN

PARLIAMENTARY LAW

PARLIAMENTARY LAW and practice consist of those rules, precedents and usages which are generally accepted as the most convenient and practicable for the government of proceedings in deliberative assemblies or organizations. Most of the essential rules now accepted had their origin in the English parliament, although some have been changed to adapt them to the needs of our legislative bodies. The rules and usages of Congress have great weight as correct parliamentary law in the United States generally, but the legislature of each state has a code of its own containing the general rules, and special ones not commonly accepted.

Besides the common parliamentary law, which is recognized by deliberative bodies in general, each body may make rules for its own government. When there are no special rules to the contrary the body is controlled by the principles of common parliamentary practice, and these principles govern if there are no rules enacted by the body itself.

Where Parliamentary Law Received its Name

Houses of Parliament, London. Most of the principal rules now accepted in parliamentary law had their origin in the English parliament.

Uses. Parliamentary law is needed in deliberative bodies in order that there may be a mutual understanding as to what may be done, that the rights of the body and of its individual members may be protected, and that business may be transacted with expedition and also deliberation.

A gathering does not become a deliberative body until it is duly organized. This implies officers and members. The number of the former may vary according to circumstances. There must be one to preside over the deliberations. Then there should be a clerk or secretary to keep a record of the transactions.

Parliamentary practice presumes that, ordinarily, matters for discussion and decision emanate from some member or members of the meeting, and that the discussing and deciding is done by the membership.

ORGANIZATION

Temporary. At the time appointed, or a few moments later, some one steps forward and requests the meeting to come to order, and, having secured attention, he either makes a motion that a certain person, giving his name, act as chairman, or asks the assembly to nominate a chairman. And he puts motions or nominations to vote, until some one is elected to preside. The chairman then takes his place, and the organization is completed by the nomination and election of a secretary, and any other necessary officers.

A Convention of Delegates. In the case of a convention of delegates, a temporary organization is first made by electing a chairman and secretary *pro tem.* Then a committee on credentials is chosen, to ascertain who are duly authorized to take part in the deliberations and the voting. This committee next reports the names of those who are found to have proper credentials, also doubtful or contested cases, with recommendations. No one without proper credentials is allowed to vote on the report of the committee, or on any question until he is duly accepted as a delegate. The organization of the convention is finished by the nomination and election of permanent officers.

After a meeting is duly organized, it is customary for some member to state briefly the object of the meeting, and business may be introduced at once, or the time may be occupied by addresses. A committee is sometimes appointed to prepare resolutions, while addresses are being given to fill up the time, and they report as soon as possible or they may be given more time, and bring in their resolutions after a recess, or at a subsequent meeting.

Permanent. In organizing a permanent society a temporary organization is first effected, after which the chairman calls upon some person who is taking a leading part in getting up the society to state the object of the proposed organization. A motion or resolution favoring the organization is next in order, and, if carried, a committee is appointed to draft a constitution or by-laws or both. The constitution should contain five articles at least, namely: (1) name and object of the society, (2) qualifications of members, (3) officers, their election and duties, (4) meetings of the society and (5) how to amend the constitution.

At the second meeting the constitution is adopted, and after all have signed the constitution who wish to become members, by-laws are adopted if desired, and a committee is appointed to nominate permanent officers, to be elected at this or an adjourned meeting. Each officer as elected takes the place of the temporary one, and when all are elected the organization is completed.

Nominations and Elections. Generally the most prudent and expeditious way of making nominations is to place the matter in the hands of a committee created for the purpose, who, after due consideration, make the nominations and tender their report to the assembly, after which a motion is made and seconded to adopt the report of the committee. Then the names of the nominees are again read with a pause after each, to give opportunity for other nominations. Any member who is not satisfied with a nomination may move to substitute another name, and if this motion receives a second and is carried the substituted name takes the place of the regular nominee.

The vote, if by acclamation, may be taken upon each name before passing to the next, but the more common way is to vote upon the names as a whole, after the entire list has been considered.

Sometimes the chairman is authorized by the assembly to make the nominations, and in this case the names are treated the same as if brought in by a committee.

Another way of nominating is as follows: Some member obtains the floor and says, "I nominate Mr. A." In the same way another member nominates Mr. B. and another Mr. C, and so on. When a number of candidates have thus been nominated, some member moves that the nominations close, and if this motion is seconded and carried the chairman then takes the vote upon the names, in the order in which the nominations were made, and continues until one is elected. If there is more than one office to be filled, the same process must be gone through with in each individual case.

If the election is to be by ballot, and the names are on the ballots, each voter may cast his ballot as it is, or he may cross off names and write others in their places. If blank slips are used, each voter writes on his slip the names of the nominees, or substitutes other names according to his choice. A majority of all the votes cast is necessary to a choice. In case the office or offices are not filled at the first ballot, the voting must be continued until the necessary officers are elected.

CONDUCT OF BUSINESS

Officers and Their Duties. The presiding officer is generally known by the title of Chairman, President or Moderator. He should always be addressed by his title, and in referring to himself he should always use his official title thus: "It is the opinion of the chair," and so forth.

It is his duty to take the chair and call the meeting to order at the proper time, to announce in its order each item of business, to state all proper questions, to put them to vote, and to declare the result of the vote, to see that the rules of debate are not violated, to preserve order, to state points of order or course of proceeding, by request, or when he finds it necessary to do so, to receive all messages and other communications and announce them to the assembly, to act for the assembly in signing all papers and so forth.

He may sit while stating a question, but he should rise to put a question to vote, or speak to a question of order.

Vice President. The vice president acts in place of the president in his absence.

Clerk or Secretary. The recording officer, whether called clerk or secretary, keeps a correct record of the proceedings, or the *minutes*, and reads them at the next meeting. In the absence of the chairman (if there is no vice president present) it is his duty to call the meeting to order, and to occupy the chair while the assembly proceeds to elect a chairman *pro tem.*, to read papers to be acted upon when requested to do so, to call the roll of the assembly when necessary, to hand to the chairman of every committee appointed a list of the persons on the committee, and a statement of the matter committed to them, to make out in order and hand to the chairman before each meeting, the items of business for the meeting, to have at each meeting a list of all committees, to have the custody of all papers and documents, to sign his name to the minutes, and to authenticate by his signature alone, or in connection with that of the chairman, all the acts, orders and proceedings of the assembly. In some assemblies the secretary is appointed to act as treasurer also.

Treasurer. The treasurer has charge of the funds of the society, and pays them out by order of the assembly, preferably on vouchers or orders signed by the secretary. His annual report should give the amount in the treasury at the beginning of the year, the amount received, the amount paid out, and the balance on hand. This report should be examined by an auditor or by an auditing committee, and compared with the itemized accounts kept by the treasurer and the receipts he has received for payments made, and if found correct it should be approved by a vote of the society.

Committees. A committee for deliberation or investigation should be large, and should represent all classes and localities. A committee for action should be small, and should consist of those only who are in favor of the proposed action.

A committee may be nominated and elected, or the chairman may be authorized by the constitution or by-laws, or by a vote of the assembly, to appoint a committee or committees. The constitution or by-laws may also prescribe the number of members of which each committee shall be composed, or the number may be included in the motion if the appointment is ordered by the assembly.

Sometimes the assembly proposes different numbers, and in this case the number is decided by vote; the vote being taken first on the highest number proposed, and then upon the next, and so on until a vote is carried deciding the number.

A special or select committee is a committee appointed for a particular occasion. A *standing* committee is one appointed beforehand, for all matters that may arise of the same nature.

The person first named on a committee is the chairman; he calls the members together, and presides all through, or until the committee elects another chairman. In the absence of the first member, the next in order who is present acts as chairman. The committee chooses a secretary, who is usually one of its own members, but may be a non-member. It conducts its proceedings in the same manner as business is conducted in the assembly.

A committee must be assembled to do business and a quorum must be present.

A paper referred to a committee must not be altered, or rejected by them. The committee may present amendments written on another sheet, or they may recommend a substitution, or make any recommendation they see fit. The report of the committee is signed by all the members, or by the chairman alone, and he makes the report to the assembly unless another has been chosen to tender it. Only that which has been agreed to by the majority can be incorporated in the report, but the minority may also tender a report if they choose. The minority report may be substituted for the report of the committee, by a vote of the assembly. When the committee has tendered its report in full and the report has been accepted, the committee is thereby discharged, but it may be revived by having the report or some part thereof referred back to it.

The Presiding Officer

The Chairman of the Pan-Pacific Conference of Rotary International presiding at the biennial meeting in Tokyo, Japan.

Sometimes the motion to adopt the report includes a recommendation "that the committee be discharged," but the recommendation is superfluous if the report is intended to be final.

Committees may *adjourn* from time to time until their work is completed. Then the motion is to *rise*, which motion means the same as to adjourn, and is subject to the same rules.

Committee of the Whole. The object of resolving the assembly into the "committee of the whole," is to permit of less formality in the consideration of a subject than is allowed under ordinary circumstances, and the motion is, "That the assembly do now resolve itself into a committee of the whole, to consider," and so forth, specifying the subject. If carried, the presiding officer at once calls another member to the chair, and takes his place as a member of the committee. The only motions in order are "to amend," "to adopt," and "to rise and report." Before going into the "committee of the whole," the assembly may pass an order limiting debate, which order cannot be changed in the committee.

The chairman having resumed his seat, the member who presided in the committee rises and informs the chairman that he is ready to report. The report may then be received, or the time fixed when it shall be received.

The clerk keeps the minutes of the proceedings of the committee, if there is not an assistant clerk to keep them, but the only record he makes in the minutes of the assembly is the report as received from the committee. If at any time the committee becomes disorderly, the presiding officer may resume the chair and declare the committee dissolved.

The quorum of the committee of the whole is the same as that of the assembly.

Informal Action. Instead of going into a committee of the whole, the assembly may consider a question informally, with the same freedom and the same restrictions as in the committee of the whole. In this case the chairman retains his seat and there is no motion to rise and report. The chairman brings the subject that has thus been considered before the assembly, and it is treated as if reported by a committee.

Any motion except "to amend" or "to adopt," puts an end to the informal action. A temporary memorandum is kept the same as in the committee of the whole, and the clerk enters the chairman's report only in the minutes.

Quorum. A quorum of an assembly, or of a committee or a board, is such a number as is competent to transact business; and unless the number is prescribed by the constitution or by-laws, or by an order of the assembly, it consists of a majority of the members. The number may be fixed at much less than a majority. When a quorum is not present the only action that can be taken is to adjourn.

Order of Business. In the absence of special rules upon the subject, the regular order of business is as follows:

(1) Reading the minutes of the previous meeting.

(2) Reports of standing committees (boards of managers, trustees, and so forth, come under this head)

(3) Reports of special or select committees.

(4) Unfinished business.

(5) New business.

To take business up out of its order requires a suspension of the rules, but a better way, sometimes, is to lay on the table business as it comes up, and thus reach a question that it is desirable to consider first.

Introduction of Business. New business must be introduced when there is no

question before the assembly. It may be brought in in the form of a resolution or recommendation, or in the form of a simple motion. The member rises, addresses the chairman by his title, and after being recognized by a bow or having his name announced, he reads his resolution or recommendation and moves its adoption; or he makes a simple motion as suggested above. In either case another member seconds the motion.

Amendments and all other questions are introduced in the same way as new business. The table of motions shows when each motion is in order, and how the question may be treated.

The mover of a motion may modify it, or withdraw it altogether before it is stated by the chair, but after it is stated he can do neither without the consent of the assembly. If a mover modifies his motion, the one who seconded it may withdraw his support, or accept the modification.

Mere routine business may be transacted without the formality of a motion, if no one objects.

Resolutions, Recommendations and Motions—Common Forms. The following are typical forms:

"Resolved, That fifty dollars of the funds of this society be appropriated to defray the expenses of its delegates at the general convention."

"We recommend, That a committee of three be appointed by the chair to draft resolutions, or to make recommendations, respecting the establishment of a branch office in San Francisco."

First Member: "Mr. Chairman, I move that the resolutions be adopted."

Second Member: "Mr. Chairman, I second the motion."

A resolution or recommendation may have a preamble or preambles worded about as follows:

Whereas, It is desirable to procure only the best of material for our new building; and,

Whereas, We deem it necessary to send a man to personally superintend its selection; therefore,

Resolved, That . . . or We recommend, That . . .

The Motion. The basis of business—the point for discussion and decision—is called the *motion*.

A motion is a formally-worded proposition presented in a deliberative body for its consideration, and for its decision by vote.

A member having something to which he desires the meeting to agree makes a motion to that effect.

Before making his motion he must obtain the floor. To do this in an organized meeting, he rises and, addressing the chairman, says "Mr. President" (or whatever the title may be), and then waits for recognition. The chairman hearing the voice and seeing the member who has risen, recognizes him by pronouncing his name, "Mr. ——," or "The gentleman (or member) from ——," mentioning the locality he represents.

No member has a right to make a motion, discuss a question, or address a meeting until he has thus addressed and has thus been recognized by the chairman. Then he has the floor.

Having obtained the floor, the member says, "Mr. President" (or whatever the title may be), "I move . . ."

Now it is necessary for another member to indicate his desire to have the proposition considered. This is called seconding the motion. To do this the second member may rise and, after securing recognition from the chair, say: "Mr. President, I second the motion." This is the better form. However, it is considered proper in ordinary assemblies for the person who seconds the motion to remain seated if he desires, and say simply: "I second the motion."

Stating the Question. The presiding officer then says, "It has been moved and seconded that . . .," and reads the resolution, or hands it to the secretary to be read by him. After stating or reading the motion, the president says, "The question is on the adoption of the resolution or motion just read," or he may say, "You have heard the motion. Have you any remarks to make?" or, "Remarks are in order," or use some equivalent expression. This is called "stating the question."

After the chairman has thus stated the question the subject is open to discussion, but not before.

In routine work the chairman may often put a question without waiting even for a formal motion. This can be done only with common or universal consent, and should be used only in regard to minor matters. Then this method saves time, and does no injustice.

After a motion has been made and seconded and the question has been stated by the chair, the members may enter upon its discussion.

If a motion is not seconded, the chair should not state it but should say: "The motion is lost for want of a second."

Debate. In order to debate a question the member must secure the floor in the same manner he would secure it for the purpose of offering a motion. The ordinary rule is for the presiding officer to give the floor to the member whose voice he first hears. When two or more address the chair at about the same time, the chair must decide who is entitled to the floor. In such a case the member upon whose motion the subject was brought before the body, or who presents the report, if he has not already spoken to the question, has the prior claim and should be recognized, even if another addressed the chair before him. A member who has not spoken has priority over those who have.

Points of Order. It is the privilege of any member to call attention to a breach of order in debate, by obtaining the floor and saying, "I rise to a point of order." The chairman then says "Please state your point of order." When the point is stated, the chairman decides whether it is well taken or not, this decision being subject to appeal. When a question of order is raised, the speaker should at once take his seat and await the decision. Then if the decision is in his favor he may proceed, but if against him, and any one objects to his speaking further, he cannot continue without permission from the assembly.

Limiting Debate. It is the custom of bodies to limit the time of a speech and the number of times a member may speak to the same question.

The common parliamentary law is not to allow a member to speak more than once to the same question until all who desire have spoken.

If a member offers to speak a second time, and no one signifies a desire to occupy the floor, and there is no objection, the chair may permit the member to proceed. Otherwise, to obtain the privilege of speaking a second time, the question must be put to vote for the decision of the meeting.

An order limiting or closing debate can be adopted, so that, at the time specified, all discussion upon it shall cease. As a body can limit the time of a speaker, it can also extend his time. The meeting can also extend the time of the debate.

In the discussion the speakers must confine themselves to the question before the body, and avoid personalities or other improprieties.

The maker of a motion may vote against, but cannot speak against, his motion.

Putting the Question. If no one rises to speak, or the chairman thinks the debate has ended, he asks, "Are you ready for the question?" If then no one rises to debate it, he proceeds to put the question to vote.

In putting the question, as it is termed, the ordinary form will be something like the following: The chair will say, "The question is on the adoption of the motion, or resolution, which you have just heard read; as many as are in favor of its adoption will say aye." The ayes having voted, he will then say, "As many as are of a contrary opinion will say no," or "All opposed will say no." The chair, judging the comparative vote, will announce the result, stating that the motion is carried or lost, as the case may be. If he thinks the ayes are in the majority he says, "The ayes appear to have it." Then pausing, to see if any one expresses doubt, and none being raised, he says, "The ayes have it, and the motion is agreed to (is carried, or prevails)," or vice versa, if he thinks the noes have it.

Form of Voting. The following are customary forms of voting: *Viva voce* (meaning by voice), ayes and noes; show of hands, which are counted by the chairman or by tellers; rising vote, the count of those standing being made by the chairman or by tellers; voters pass between tellers, who count them; yeas and nays; ballot.

Where a hand-vote is customary the chair may say, "Those in favor of the motion or resolution will hold up the right hand," and "Those opposed will manifest it by the same sign." Excepting in a few cases a majority vote determines a question.

Discussion can be renewed even after the voting has begun, and up to the final voting of both sides.

Caution. Some chairmen make the mistake of saying: "All in favor of the motion say *aye*. Those opposed manifest it by the same sign."

The term "same sign" only applies when the vote is being taken by a show of hands, or other visible indication of the voter's preference.

When a motion is put to a vote the literal question before the house is: "Shall the mo-

tion be adopted?" The answer is either yes or no. When those in favor say "aye" (which is another form of the word "yes"), those opposed should say "no." If those who are in favor of adoption say "aye" or "yes," then if those opposed should manifest it by the "same sign," this would require them also to say "aye" or "yes," meaning that they are in favor of adoption, whereas they are not.

Division. Sometimes a motion may consist of more than one distinct idea, and therefore would be divisible into two or more distinct propositions, and it might be that some would favor one part and not another, and, consequently, would desire to vote on the parts separately. In such a case a member can move that the question be divided, and specify in his motion how it is to be divided. If the motion for a division of the question prevails then each part will be put to vote as though it were a separate motion, and one part may be carried and another lost.

When the chairman announces the result of a vote any member may express a doubt as to the accuracy of the decision by rising and saying, "Mr. President, I call for a division of the house." If a member thus calls for "division" the presiding officer shall say, "A division is called for; those in favor of the motion will rise and stand until counted." After they are counted and the number announced, he shall say, "Those opposed will rise:" and they will be counted and the number announced.

The chair or the clerk, or both, may count. After the announcement of the result a member may press the doubt further by calling for a count by tellers, and even after that has been taken there may be a demand for the yeas and nays.

Yeas and Nays. The object of calling the yeas and nays is usually to place the names of the members on record so that it will be known how each man voted. At other times it is used as dilatory motion, and is made for the purpose of consuming time. In Congress one-fifth of the members present can order the vote to be taken by yeas and nays. In some bodies it is ordered on the call of a single member. Societies should have a rule stating what small minority may order the yeas and nays. In any meeting a majority vote can order the yeas and nays. When the yeas and nays have been ordered, the presiding officer will put the question in a form similar to the following: "As many as are in favor of the adoption of the resolution will, when their names are called, answer *yea*, (or *yes*); those opposed will answer *nay*, (or *no*). The secretary (or clerk) will call the roll."

The roll is then called, and each member, as his name is called, rises and answers *yes* or *no*, (or *yea* or *nay*), which answer is noted by the clerk. When the roll-call is ended the clerk reads the names of those who voted in the affirmative, and afterward those who voted in the negative. Errors may then be corrected. The clerk then gives the number voting on each side to the chair, who announces the result.

The Ballot. Sometimes a vote is by ballot. It is common and most equitable in the election of officers.

The chairman appoints at least two tellers, who distribute slips of paper upon which the members write their votes. The tellers collect and count the votes and report the result to the chairman, who announces it to the meeting. In counting ballots all blanks are ignored. In case of an election the chair will say: "The whole number of votes cast is——; the number necessary for a choice is——; Mr. A. received——; Mr. B.——; Mr. C.——. Mr. A., having received the requisite number, is therefore elected."

Tie Vote. When there is a tie vote the motion fails. The chairman, if a member of the meeting or, authorized by constitutional law, however, has the casting or deciding vote in such a case, and, if he gives it for the affirmative, the motion prevails. He may even vote with the minority when his vote will make a tie, and thus defeat a measure, and he may vote in any case where his vote would change the result. Thus where a two-thirds vote is necessary, and his vote given to the minority would prevent the adoption of the question, the presiding officer can so cast his vote.

Classes of Motions. Motions are differently classified according to their nature and purpose, including:

(1) The principal motion or main question by which the subject is brought before the body.

(2) Those which bear upon the main question. These are called subsidiary motions, and are as follows: (*a*) to postpone indefinitely, (*b*) to amend, (*c*) to refer (commit or recommit), (*d*) to postpone to a certain day or time, (*e*) the previous question, (*f*) to lay on the table.

(3) Incidental questions, so called because they are occasioned in a casual way during the consideration of other questions. From their very nature they must be decided before the questions which give rise to them. They cover: (*a*) suspension of the rules, (*b*) withdrawal of a motion, (*c*) reading of papers, (*d*) objection to the consideration of a question, (*e*) questions of order (including appeals from the decision of the chair).

(4) Privileged questions, so called because of their pressing importance and their need of immediate attention; therefore they may interrupt other proceedings. They are: (*a*) calls for the orders of the day, (*b*) questions of privilege, (*c*) the motion to adjourn, (*d*) the motion to fix the time to which to adjourn.

Order of Precedence. The motions below numbered 1 to 9 take precedence over all others in the order given, and any one of them, except to amend or substitute, is in order while a motion of a lower rank is pending.

(Letters refer to rules following)

Closing a meeting.									
1. To fix time to which to adjourn									B
2. To adjourn (in committees, to rise), or to take a recess, without limitation					A	E	F		
Concerning Orders, Rules and so forth									
3. For the orders of the day					A	E	H	N	
To make subject a special order								M	
To amend the rules								M	
To suspend the rules					A	E	F	M	
To take up a question out of its proper order							A	E	
To take from the table						A	E	G	
Questions touching priority of business								A	
4. To lay upon the table						A	E	G	
To bring up a question the second time.									
To reconsider debatable question					D	E	F	I	
To reconsider undebatable question					A	E	F	I	
Questions of privilege.									
Asking leave to continue speaking after indecorum									A
Appeal from chair's decision touching indecorum					A	E	H	L	
Appeal from chair's decision generally						E	H	L	
Question upon reading of papers							A	E	
Withdrawal of a motion							A	E	
Suppressing or extending debate.									
5. For the previous question					A	E	M		
To limit, or close, debate							A	M	
To extend limits of debate								A	
Deferring action.									
6. To postpone to a fixed time									C
To refer to committee.									
7. To commit (or recommit)									D
Modifying or amending.									
8. To amend or to substitute, or to divide the question									K
Suppressing the question.									
Objection to consideration of question					A	H	M	N	
9. To postpone indefinitely								D	E

Rule A. Undebatable, but remarks may be tacitly allowed.
Rule B. Undebatable if another question is before the assembly.
Rule C. Limited debate allowed on propriety of postponement only.
Rule D. Opens the main question to debate. Motions not so marked do not allow of reference to main question.
Rule E. Cannot be amended. Motion to adjourn can be amended when there is no other business before the house.
Rule F. Cannot be reconsidered.
Rule G. An affirmative vote cannot be reconsidered.
Rule H. In order when another has the floor.
Rule I. A motion to reconsider may be moved and entered when another has the floor, but the business then before the house may not be set aside. This motion can only be entertained when made by one who voted originally with the prevailing side. When called up it takes precedence of all others which may come up, excepting only motions relating to adjournment.
Rule K. A motion to amend an amendment cannot be amended.
Rule L. When an appeal from the chair's decision results in a tie vote, the chair is sustained.
Rule M. Requires a two-thirds vote unless special rules have been enacted.
Rule N. Does not require to be seconded.

General Rules. No motion is open for discussion until it has been stated by the chair.

The maker of a motion cannot modify it or withdraw it after it has been stated by the chair, except by general consent.

Only one reconsideration of a question is permitted.

A motion to adjourn, to lay on the table, or to take from the table, cannot be renewed unless some other motion has been made in the interval.

On motion to strike out the words, "Shall the words stand as part of the motion?" unless a majority sustains the words, they are struck out.

On motion for previous question, the form to be observed is, "Shall the main question be now put?" This, if carried, ends debate.

On an appeal from the chair's decision, "Shall the decision be sustained as the ruling of the house?" the chair is sustained if the vote is a tie.

On motion for orders of the day, "Will the house now proceed to the order of the day?" This, if carried, supersedes intervening motions.

When an objection is raised to considering questions, "Shall the question be considered?" objections may be made by any member before debate has commenced, but not subsequently.

HIGH SCHOOL LITERARY SOCIETY

Model for Organization. The following is suggested as a correct procedure in forming a literary society for a high school.

A group of students who are interested have met in a class room. Mr. White, a young man who has been active in bringing them together, takes his place on the platform, raps on the desk, and says:

"The meeting will please come to order. Nominations for Temporary Chairman will be received."

Mr. Smith (rising): "I nominate Mr. Jones."

Miss Brown (either rising or seated): "I second the nomination."

Mr. White: "It has been moved and seconded that Mr. Jones act as Chairman. All in favor will say *aye*."

High School Literary Society

After considering the number voting aye, Mr. White says: "All opposed say *no*."

If satisfied that a majority have voted aye, Mr. White says: "The motion is carried. Will Mr. Jones please take the chair?"

If satisfied that a majority have voted no, Mr. White says: "The motion is lost. Other nominations are in order."

If more than one are nominated, Mr. White puts to a vote each name in the order nominated, until one receives a majority.

Mr. Jones (or whoever is chosen) takes the chair and addresses the group somewhat as follows:

"I thank you for the honor. I consider that it is greatly to our advantage to have a literary society in our high school, and I trust we shall make it a source of credit to our school. Nominations for Secretary are in order."

Miss Ames (rising): "Mr. Chairman."

The Chairman: "Miss Ames."

Miss Ames: "I nominate Miss West."

Mr. Black (either rising or seated): "I second the nomination."

The Chairman: "Are there any other nominations?" (After a pause) "There being no further nominations, we will proceed to vote. It has been moved and seconded that Miss West act as Secretary of the meeting. All in favor say *aye*." (After considering the number voting aye) "All opposed say *no*. The motion is carried. Will Miss West please take her place as Secretary?"

Miss West does so, and thereafter keeps a record of all motions made, seconded and carried; of officers elected, communications received and other business transacted.

The Chairman: "I will ask Mr. Randall to state the object of this meeting."

Mr. Randall (rising): "Mr. Chairman."

The Chairman: "Mr. Randall."

Mr. Randall: "It has been evident for some time that a literary society is needed in this high school. It will give us a chance to learn many things which we cannot get from our regular studies. For example, we shall become trained in parliamentary law. We shall acquire the art of speaking in public. We shall obtain practice in debating. To that end I move the adoption of the following resolution, which I will ask the Secretary to read."

He hands it to the Secretary, who reads it aloud:

> "RESOLVED, That a literary society be formed in this high school for the purpose of self-improvement of the members."

Miss Arnold: "I second the resolution."

(The person who seconds a motion or resolution need not rise nor address the chair. All others wishing to take part in the proceedings should first rise, address the presiding officer by his or her appropriate title, and wait for recognition by the chair before speaking.)

The Chairman: "Are there any remarks?"

Several persons present speak for or against the resolution.

The Chairman: "Are you ready for the question?"

No one rises to speak, but several persons call out: "Question."

The Chairman: "You have heard the resolution, which has been duly moved and seconded. All who are in favor of the adoption of the resolution will say *aye*. All opposed say *no*. The resolution is adopted."

Miss Stewart (rising): "Mr. Chairman."

The Chairman: "Miss Stewart."

Miss Stewart: "I move that the Chairman appoint a committee of three to draft a constitution and by-laws, and to report at our next meeting."

Mr. Cox: "I second the motion."

The Chairman: "It has been regularly moved and seconded that the Chairman appoint a committee of three to draft a constitution and by-laws, and to report at our next meeting. Are there any remarks?" (Hearing none) "Are you ready for the question?" (Several say *Question*) "All who are in favor of the motion will say *aye*. Those opposed say *no*. The motion is carried. I will appoint Mr. White, Miss Ames and Mr. Green as the committee."

(Mr. White, being named first, is Chairman of the committee.)

Mr. Adams: "Mr. Chairman."

The Chairman: "Mr. Adams."

Mr. Adams: "I move we adjourn."

Miss Moore: "I second the motion."

This motion is not debatable, cannot be amended, and takes precedence over all other business. It must be put to a vote at once unless a motion is made to adjourn to a fixed time or place, as follows:

Miss Turner: "Mr. Chairman."

The Chairman: "Miss Turner."

Miss Turner: "I move that we adjourn to meet again in this room two weeks from today at three o'clock in the afternoon."

Mr. Pope: "I second the motion."

This motion is debatable, and may be amended, as for example:

Mr. Long: "Mr. Chairman."

The Chairman: "Mr. Long."

Mr. Long: "I move to amend the motion to read that we adjourn to meet one week from today at four o'clock in the afternoon."

Miss Clarke: "I second the amendment."

The Chairman: "The question is first on the amendment. Are there any remarks? All who are in favor of the amendment will say *aye*. Those opposed say *no*. The amendment is carried. The question is now on the motion as amended. Are there any remarks? All who are in favor of the motion as amended will say *aye*. Those opposed say *no*. The motion is carried, and the meeting now stands adjourned to meet again in this room one week from today at four o'clock in the afternoon."

If the amendment is lost the Chairman will announce it thus: "The amendment is lost. The question is now on the original motion." (Proceed in the regular order by asking for remarks, and so forth.)

If the motion to adjourn is lost it cannot be renewed until some business has been transacted.

One week later, at four o'clock in the afternoon, the second meeting is held, with the Temporary Chairman and Temporary Secretary still performing their respective duties.

The Chairman: "The meeting will please come to order. The Secretary will read the minutes of the previous meeting."

The Secretary does so.

The Chairman: "You have heard the minutes. Are there any corrections or additions? If not, they will stand approved as read."

If corrections or additions are made, the announcement will be: "The minutes as corrected (or enlarged) will stand approved."

The Chairman: "The next order of business will be the report of the committee on

constitution and by-laws, of which Mr. White is Chairman."

Mr. White: "Mr. Chairman."

The Chairman: "Mr. White."

Mr. White: "Your committee submits the following proposed constitution and by-laws."

He hands the manuscript to the Secretary.

The Chairman: "What is your pleasure? Shall we read the constitution and by-laws and vote upon their adoption as a whole, or shall we read and vote upon them article by article?"

Miss Wood: "Mr. Chairman."

The Chairman: "Miss Wood."

Miss Wood: "I move that we vote upon the constitution and by-laws as a whole."

Mr. Dean: "I second the motion."

The Chairman: "It is moved and seconded that the meeting vote upon the constitution and by-laws as a whole. All who are in favor will say *aye*. Those opposed say *no*. The motion is carried. The Secretary will read the proposed constitution and by-laws."

The Secretary does so.

Mr. Young: "Mr. Chairman."

The Chairman: "Mr. Young."

Mr. Young: "I move the adoption of the constitution and by-laws as read."

Miss Faris: "I second the motion."

The Chairman: "It is regularly moved and seconded that the constitution and by-laws as read be adopted. Are there any remarks? Are you ready for the question? All who are in favor will say *aye*. Those opposed say *no*. The motion is carried, and the constitution and by-laws are adopted."

If the motion to adopt as a whole is lost, or if no such notion is made, the following should be the procedure:

Miss Gale: "Mr. Chairman."

The Chairman: "Miss Gale."

Miss Gale: "I move that the constitution and by-laws be considered and adopted article by article."

The motion is seconded and adopted.

The Chairman: "The Secretary will read the first article." (The Secretary does so.) "Are there any amendments or additions?"

If members desire to amend or add to the article, motions to that effect may be made and seconded, and the Chairman will put them to a vote until the article is satisfactory to a majority of those present; and so on with the succeeding articles.

If there are no amendments or additions the Chairman, after a pause to ascertain the fact, will say: "All who are in favor of Article I as read will say *aye*. Those opposed say *no*. The ayes have it, and Article I as read is adopted." (And so on with the rest.)

Another method, equally proper, is for the Chairman to say: "Are there any amendments or additions to this article? Are there any objections? Hearing none, I will ask the Secretary to read the next article."

In either case, after all the articles have been read and either passed by or acted on, they should be adopted as a whole; thus:

Mr. Hart: "Mr. Chairman."

The Chairman: "Mr. Hart."

Mr. Hart: "I move that the entire constitution and by-laws (as amended, if that has been done) be adopted as a whole."

Miss Knox: "I second the motion."

The Chairman: "It is regularly moved and seconded that the constitution and by-laws as amended be adopted as a whole. Are there any remarks? Are you ready for the question? All in favor will say *aye*. Those opposed will say *no*. The motion is carried and the constitution and by-laws are adopted as a whole."

The Chairman: "We will now take a recess for ten minutes, during which time all persons present who wish to become members of the new literary society will please sign the constitution and by-laws." (They do so.)

At the conclusion of the recess the Chairman raps for order again and says: "The next order of business will be the election of officers in accordance with the constitution. How will you have them selected? Shall we appoint a committee on nominations or shall we have nominations from the floor for each office?

Mr. Burton: "Mr. Chairman."

The Chairman: "Mr. Burton."

Mr. Burton: "I move that the Chairman appoint a committee on nominations consisting of three members, who shall retire and report back to this meeting as soon as they have made their selections."

The motion is seconded and carried. The Chairman appoints Mr. Burton, Chairman; Miss Knox and Mr. Hart. They retire.

The Chairman: "While we are waiting for the committee on nominations to report, I suggest that we have expressions of opinion from several present as to what our proposed literary society should do." Various suggestions are made. The committee returns to the room.

The Chairman: "Is the committee on nominations ready to report?"

Mr. Burton: "Mr. Chairman."

The Chairman: "Mr. Burton."

Mr. Burton: "The committee on nominations recommends the election of the following persons to serve as permanent officers of this literary society":

Mr. Burton may read the report himself or hand it to the Secretary, who reads it.

"For President, Mr. Hill; for Vice President, Miss Pierce; for Recording Secretary, Miss Abbott; for Corresponding Secretary, Miss Early; for Treasurer, Mr. Noble."

Mr. Kane: "Mr. Chairman."

The Chairman: "Mr. Kane."

Mr. Kane: "I move that the candidates named by the committee on nominations be declared elected."

Miss Page: "I second the motion."

The Chairman: "It is regularly moved and seconded that the candidates named by the committee on nominations be declared elected. Are there any other nominations? There being no other nominations, are you ready for the question?"

Mr. Foster: "Mr. Chairman."

The Chairman: "Mr. Foster."

Mr. Foster: "I rise to a point of order."

The Chairman: "Please state your point of order."

Mr. Foster: "My point of order is that the constitution provides that all elections for officers shall be by ballot. Hence the motion now before the house proposes a method of election that would be illegal."

The Chairman: "The point of order is well taken. The motion that the candidates named by the committee on nominations be declared elected is out of order."

Mr. Hopkins: "Mr. Chairman."

The Chairman: "Mr. Hopkins."

Mr. Hopkins: "I move that the Secretary be instructed to cast one ballot in favor of the election of the candidates named by the committee on nominations."

Miss Cooper: "I second the motion."

The Chairman: "It is regularly moved and seconded that the Secretary be instructed to cast one ballot in favor of the election of the candidates named by the committee on nominations. Are you ready for the question? All who are in favor of the motion will say *aye*. Those opposed say *no*. The motion is carried, and the Secretary is so instructed."

The Secretary writes the names and offices on a ballot, and reports: "Mr. Chairman."

The Chairman: "Madam Secretary."

The Secretary: "The ballot has been cast in favor of the election of the following: For President, Mr. Hill; for Vice President, Miss Pierce; for Recording Secretary, Miss Abbott; for Corresponding Secretary, Miss Early; for Treasurer, Mr. Noble."

(In practice, it is not necessary for the Secretary actually to write the names on a ballot, but it is sufficient if the Secretary states to the Chairman that the ballot has been so cast.)

The Chairman: "The ballot has been cast for the candidates named, and I declare them duly elected to their respective offices. Will Mr. Hill please come forward and take the chair, and will Miss Abbott please take her place as Recording Secretary of the meeting?" (They do so.)

If there are other nominations from the floor for any office, then the Secretary cannot be instructed to cast a ballot for that office. The Chairman takes up in turn each office for which additional nominations are made, beginning with the President, and says:

"Are there any other nominations for President? Hearing none, we will proceed to vote on the candidates in the order in which their names were proposed."

Or somebody may move that nominations be closed, which must be seconded and put to a vote. If carried, the Chairman proceeds:

The Chairman: "Mr. Hill, Miss Blake and Mr. Hood have been nominated for President. According to the by-laws, all elections for officers shall be by ballot. The Secretary will prepare ballots and distribute them to the persons present who are entitled to vote. All persons who have signed the constitution and by-laws are entitled to vote. Each member will write upon the ballot the name of the candidate for President preferred. Then fold the ballot and hand it to one of the tellers. The Chairman appoints Mr. Taylor and Miss Faris as tellers, who will collect the ballots and count them, and report the result of the vote."

If there are factions, the chair should appoint a teller from each faction, so far as possible.

The tellers collect and count the ballots, Mr. Taylor, having been named first, reports:

Mr. Taylor: "Mr. Chairman."

The Chairman: "Mr. Taylor."

Mr. Taylor: "The result of the vote is as follows:

Whole number of votes cast, 37; necessary to a choice, 18.

Mr. Hill received 19 votes; Miss Blake received 10 votes; Mr. Hood received 8 votes."

Or the tellers may hand the report to the Secretary, who reads it.

The Chairman repeats to the meeting the result of the vote, and adds: "Mr. Hill, having received a majority of all the votes cast, is duly elected President. Will Mr. Hill please take the chair."

If no one has received a majority, the Chairman says: "No one having received a majority of the votes cast, you will prepare your ballots again." And so on until one receives a majority.

The successful candidate for President takes the chair.

The same procedure is followed for the other candidates.

Instead of appointing a committee on nominations, all nominations may be made from the floor. Where nominations are made from the floor, the procedure will be as already outlined after the committee on nominations makes its report. Thus:

The Chairman: "Nominations for President are in order."

Miss Page: "Mr. Chairman."

The Chairman: "Miss Page."

Miss Page: "I nominate Mr. Hill."

(Nominations need not be seconded.)

Mr. Gray: "Mr. Chairman."

The Chairman: "Mr. Gray."

Mr. Gray: "I nominate Miss Blake."

Mr. Nolan: "Mr. Chairman."

The Chairman: "Mr. Nolan."

Mr. Nolan: "I nominate Mr. Hood."

The Chairman: (After a pause) "Are there any further nominations?" (No response) "If there are no further nominations for President, I declare the nominations closed."

Or, somebody may move that nominations be closed, which motion is seconded and carried.

The Chairman: "You will prepare your ballots." (The votes are collected and counted by the tellers; they report the result to the Chairman, who announces it to the meeting, as already outlined.)

The same procedure is followed for all the officers.

If there is only one nomination, someone after being recognized by the Chairman may say: "I move that the Secretary cast one ballot for Mr. Hill for President."

If seconded and carried, the Secretary reports: "Mr. Chairman, the ballot has been cast in favor of Mr. Hill for President."

The Chairman: "The ballot has been cast for Mr. Hill, and I declare him duly elected President."

The foregoing is not intended to cover all possible variations in the organization of a society, but to furnish a model that may be safely followed.

Model Constitution and By-Laws. The constitution provides the framework, while the by-laws take care of the working details. The former is the carriage; the latter, the power. The line is not closely drawn, however, and often the whole may be merged and called either the one or the other.

The following is offered as a model that contains the main essentials:

CONSTITUTION

ARTICLE I

NAME. The name of this organization shall be the Adelphian Literary Society of the Springfield High School.

ARTICLE II

OBJECT. The object of the Society shall be the self-improvement of the members in public speaking, debating, essay writing, parliamentary law and kindred subjects.

ARTICLE III

MEMBERS. Members shall consist of two classes—active and honorary. Active members shall comprise students in good standing in their studies in the Springfield High School, who may sign the constitution and pay the required dues. Honorary members shall comprise teachers, alumni and guests, who shall not be required to pay dues.

ARTICLE IV

OFFICERS. The officers of the Adelphian Literary Society shall be a President, a Vice President, a Recording Secretary, a Corresponding Secretary and a Treasurer, who shall be elected by ballot from the active members of the society at the last meeting in each semester of the school year. The officers shall assume office at the first regular meeting in each semester, and shall serve for a term of one semester and until their successors shall be elected and take office. A vacancy in any office may be filled at any regular meeting, for the balance of the term. The officers shall have the customary powers of such offices in parliamentary bodies.

ARTICLE V

COMMITTEES. There shall be the following standing committees, of three members each, to be appointed by the President:

Membership, Program and Entertainment.

The Membership committee shall endeavor to secure desirable members for the Society. All applications for membership shall first be passed on by the membership committee, who shall recommend to the Society such names as the committee approves.

The Program committee shall arrange for the programs of each meeting.

The Entertainment committee shall provide for special entertainment features not included in the regular programs.

Other committees, either standing or special, may be appointed as seems necessary. Unless otherwise provided for in the resolutions creating them, all special committees shall be appointed by the President.

ARTICLE VI

MEETINGS. Regular meetings shall be held at four o'clock in the afternoon of Wednesday of each week while school is in session. Where the regular meeting day falls on a holiday, the meeting shall be held on the day previous. Special meetings may be called by the President or by any five members, by posting notice thereof on the regular bulletin board of the High School, at least two days before the meeting is to be held. Such notice shall state clearly the time and place of the meeting.

ARTICLE VII

AMENDMENTS. Amendments to the constitution may be presented at any regular meeting, but shall not be voted on until the next regular meeting. A majority vote of all active members present at the meeting shall be necessary for adoption.

BY-LAWS

ARTICLE I

QUORUM. A majority of all the active members shall constitute a quorum. (If the membership is large, a smaller number than a majority may be declared a quorum.)

ARTICLE II

RIGHTS AND DUTIES OF MEMBERS. Active members may serve on committees and hold office. Honorary members shall have the right to be present at all meetings, and may take part in the discussion of any question, but shall not have the right to vote. They may serve on committees, but shall not hold office.

New members shall be admitted in the following manner:

At each regular meeting the name of an applicant may be proposed by an active member. All names proposed shall be referred to the membership committee who shall report at the next regular meeting. If the committee's report is favorable, each name shall be voted on separately. A majority vote of all active members present is necessary to elect to membership.

ARTICLE III

DUES. The dues of active members shall be one dollar for each semester, payable during the first two weeks of the semester. If not paid within two weeks, the member shall stand suspended until the dues are paid. During suspension a member may attend meetings, but shall not take part in the program, nor serve on committees nor hold office. If the dues are not paid by the end of the semester, the member's name shall be stricken from the membership roll. To become a member again his name must be proposed and passed on by the membership committee, and voted on by the membership as in the case of other applicants.

ARTICLE IV

RULES OF ORDER. All questions of parliamentary law shall be governed by *Robert's Rules of Order*, Revised Edition.

ARTICLE V

DUTIES OF OFFICERS. The President shall preside at all regular and special meetings, and appoint all committees not otherwise provided for. The Vice President shall perform the duties of the President when the President is absent or otherwise unable to act. The Recording Secretary shall keep the minutes of all regular and special meetings in a book to be kept for that purpose. The Corresponding Secretary shall send out written notices and attend to such correspondence as may be required. The Treasurer shall collect the dues and pay such bills as have been approved for payment in open meeting. He shall keep an accurate record of all receipts and disbursements. He shall present a report at each regular meeting showing the balance on hand. At the end of his term of office he shall turn over all of the money, with his books and records, to his successor.

ARTICLE VI

ORDER OF BUSINESS. At every regular meeting, the order of business shall be:

1. Roll call
2. Reading minutes of preceding meeting
3. Program
4. Receipt of communications, bills, and so forth
5. Reports of standing committees
6. Reports of special committees
7. Unfinished business
8. New business
9. Adjournment

By a two-thirds vote at any regular meeting, the order of business may be set aside for that meeting.

The reading of the minutes may be dispensed with by a majority vote.

ARTICLE VII

AMENDMENTS. Amendments to the by-laws may be presented at any meeting, whether regular or special, but shall not be voted on until the next meeting, either regular or special. A majority of a quorum present at the meeting shall be necessary for adoption.

DICTIONARY OF POLITICAL SCIENCE TERMS

Absolutism. A form of government in which the supreme power of the state is placed in one person whose rule is unlimited.

Admiralty. A branch of law which deals with civil and criminal cases arising on the high seas. In the United States, admiralty implies jurisdiction by the Constitution in the Federal Courts. In England, admiralty designates that department of government which has jurisdiction over the naval forces of the Empire and over all merchant vessels flying the British flag.

Alabama Claims. During the American Civil War, ships built by British firms, sent from British ports and sailing under the Southern flag, attacked Northern shipping. The most notorious case was that of the *Alabama*. The British government had warning that the *Alabama* was to be used by the Confederates. But partly by neglect and partly by misfortune, the authorities did not act in time. For a period of about two years this ship attacked Northern shipping. A number of futile attempts were made to settle the claims for damages. However, by the treaty of Washington, various outstanding questions were settled and the *Alabama* claims were referred to a court of five arbitrators sitting at Geneva. A solution of the controversy was finally found. The award was fixed at £3,250,000, or $15,795,000.

Alien. One who is "of another country," consequently, a person residing in a country, who is not a natural born citizen, or who has not been naturalized, is an alien in that country. A child born in a country takes the citizenship of his father. In United States a person born out of the jurisdiction of the United States who has not been naturalized is an alien.

Amnesty. An act of government granting exemption from criminal prosecution and punishment. It is often extended to a class or group, as was the case with the South after the Civil War. Unlike pardon, it is granted before conviction rather than afterward.

Anarchism. The socialist contends that society needs more government; the anarchist believes that there should be less government. The fundamental principle of anarchism is that if man were left unhampered by the restrictions of government and were properly developed by education, he would develop in such a way that the best interests of every one would be taken care of in an ideal way.

Aristocracy. Aristocracy was a term used by the ancient Greeks to denote government by the best qualified. With the Ancients, the aristocracy not only monopolized office and power, but citizenship

as well. There were no citizens but they; they were the State.

The word aristocracy is applied also to the nobility in countries where monarchical institutions exist; and so, by analogy, refers to those who assume superiority in social standing or personal qualities.

Belligerency. The condition whereby regularly organized fighting becomes entitled to the protection of recognized laws and usages of war. The international rules of warfare provide that troops, in order to be entitled to these privileges; must be part of the military force of a recognized belligerent; must be commanded by properly commissioned officers; must wear distinctive uniform; must carry arms openly, and must not violate the usages of war among civilized nations. Some of the rights of belligerents are: the right of surrender and capture rather than death upon the field; trial by court-martial before execution; and humane treatment as prisoners of war. Mere rebels or insurgents do not have any of the rights of belligerents.

Bicameral System. In the federal government of the United States, as in the states, the law making power is vested in a double legislature: a Congress consisting of a Senate and a House of Representatives. Unlike the two houses of a state legislature, however, the two houses of Congress have distinct characters. The Senate differs from the House not only in the number of its members, but also in the principle of its composition. It represents the federal principle upon which the government rests, for its members represent the states. The House of Representatives, on the other hand, represents the national principle upon which, also, the government has now been finally established. Its members represent the people. All legislation comes from the two houses acting in concert; but three additional functions of government are performed by the Senate alone: (1) it has the power to confirm or reject nominations of executive officials by the President, (2) it shares treaty-making power with the President, (3) it sits as a court of impeachment. In all matters of legislation the two houses have equal authority, except for the special constitutional prerogative of the House of Representatives to initiate revenue bills; but this has proved of little practical significance. In the state governments, the two-chamber system is usually justified as a check on hasty or unwise legislation.

Bloc. A French term, meaning "mass" or "group." It has been introduced into political usage to mean an association of legislative members or of political workers of different parties, formed to support a certain proposition or ministry. The term has recently been introduced into American politics through the union of members of Congress pursuing certain agrarian policies in what is called the "agricultural bloc."

Boodle. Money used in bribing public officials or in improperly influencing elections.

Bounty. A grant of land, money or other consideration by the government to private individuals, either to reward services that have been performed, or to encourage activities deemed of public benefit such as highways, railroads and steamship lines.

Cabinet. In carrying on his duties the President is aided by executive officials, ten of whom form an advisory Cabinet, a body not mentioned in the written Constitution. At present, the Cabinet consists of the Secretaries of State, Treasury and War, Attorney-General, Postmaster-General and the Secretaries of the Navy, Interior, Agriculture, Commerce and Labor.

Campaign, Political. Organized effort by a political party or group to secure the election of its candidates to office. The campaign may occupy the entire time between the nominations and the elections, or it may be limited chiefly to the months preceding the polling of the votes. The campaign is conducted by the party committees. In a presidential campaign, for example, there is a special national executive committee whose chairman, for months, directs the campaign, and whose members assume the task of persuading or convincing voters. Money must be obtained to pay the expenses of printing campaign literature and to secure the services of speakers, while personal efforts must be used to obtain the support of doubtful voters, and to bring all of the party's supporters to the polls. In a city election, the general conduct of the campaign, including the raising and distributing of funds, belongs to the city committee; and the ward committees under its charge, organize clubs, hold meetings and perform active duties on election day.

Caucus. A political caucus is a meeting of members of a political party to determine what stand the party will take toward local, state or national problems. A caucus may be a meeting of national leaders to determine what person is the most promising individual for President, or a meeting of ward politicians in any city to determine the party policy on any petty issue.

Citizenship. Often the terms "citizen" and "voter" are confused. A voter is a person who is allowed by law to take part in the government. A citizen is a member of the nation. A citizen of the United States is a member of the large society which we call the United States of America.

In the United States, citizenship is defined in the Fourteenth Amendment to the Constitution as: "All persons born or naturalized in the United States and subject to the jurisdiction thereof, are citizens of the United States and of the state wherein they reside."

Civil Law. In civil cases the individual who has been offended brings action before the court. The state has no concern in such cases except to see that justice is done. The subjects upon which suits may be brought are innumerable. Perhaps the most important branch of the law has to do with property, the holding of land and the transfer of title by sale, inheritance or will. Other important considerations are the collection of debt, the rights of public utilities and the right of corporations.

Closure Rule. A usage in parliamentary bodies to close debate upon a bill or proposition. First, a motion is made that the question be acted upon. In the event that this motion is carried, the matter under discussion is at once put to vote, without further debate. This term had its origin in the French Parliament.

Coalition. An alliance of persons, parties or states for offensive or defensive purposes.

During the World War there were not only coalitions of governments but also of parties in many of the governments, in order to present a united front for the prosecution of the war.

Collectivism. An economic and social theory based on the idea that a "productive capital" should belong to the community, and the share of each individual should be determined by the worth or social utility of his contribution to the social income. For practical purposes this theory is synonymous with the term socialism.

Commission Government. A large number of cities in the United States, chiefly of medium size, have sought to remedy the defects in municipal government by a radical change in municipal organization. In place of a council with a mayor, these cities select a body of commissioners, usually five in number, who become the governing body of the city. The commissioners are elected at large and afterwards assigned to different departments of the city's administration. The commission is both a legislative and an administrative body.

Common Law. Crimes are usually defined by statute; however, when no distinct statutes have been passed, offences in most states may be punished under common law—that is the nature of the offence and penalty are to be ascertained from the practice of the courts in England and America. In this way, law is built up and developed by judicial precedents.

Communism. A system of economic and social organization in which all property is owned by the state or group, and is to be shared in common or to be distributed among the members of the community equally, or in proportion to their needs. Communism practically abolishes the theory of private property. It goes much further than either collectivism or socialism, which aim to bring only productive capital, such as land, factories, mines, railways and public utilities, under public ownership.

Conservation. A policy of governmental regulation of the use and development of the natural resources of the country, so as to prevent waste, exhaustion and destruction by private ownership. Conservation sometimes goes further, and attempts to provide a systematic development of those resources in the interest of the general public. An example of this is the interest of the state and federal governments in the problem of conservation and regrowth of our forests.

Conservative. A conservative is one who is satisfied with present day conditions. He wishes to conserve the present and has a fear of change, for he has a feeling that any change is apt to bring disaster to our social and political structure.

Consul. A representative of a government in a foreign country, who is primarily a commercial agent and performs a large number of routine duties; but his first and foremost duty is that of a commercial representative.

Contraband. An article that is sent from a neutral to a belligerent country in time of war for military or naval use. Under international law, such merchandise may be seized and confiscated if taken upon the high seas or within the territory of the enemy. Usually, confiscation follows the judgment of a prize court where the neutral owner may have the right to appear and defend his title. The World War so completely engaged the entire resources of the world that it would now be very difficult to say what is not contraband in time of war.

Criminal Law. Each state determines just what is crime and in a criminal case, the state is always the prosecutor. Cases may be suggested by the injured person or his friends, but must be tried by a public prosecutor. The usual penalty for crime is a fine or imprisonment, or both; and in most states death is the penalty for the most serious crimes.

De Facto Government. A government that has actual control of the government in a territory, regardless of its legal authority. A *de facto* government differs from a *de jure* government in that the latter is based on legal right and recognition by international argument.

Direct Legislation. See Referendum.

Diplomatic Representation. The President of the United States is our official spokesman in dealing with other nations, but the actual conduct of foreign affairs is vested in the Secretary of State. The Department of State of which the Secretary of State is the head, was organized by Congress in 1789.

The diplomatic group is divided into four classes: (1) ambassadors extraordinary and plenipotentiary, (2) envoys extraordinary and ministers plenipotentiary and special commissioners, (3) ministers resident and (4) charges d'affaires.

A diplomatic representative enjoys, under the rule of international law, several special privileges and immunities. Any injury or affront to him is an offence against the country which he represents, and against international comity. The house in which he resides is under the particular protection of the law: it may not be entered or disturbed by any one against his will. A minister is entitled to special protection while traveling on land or sea. He and his official family, including even his domestic servants, are exempt from arrest—in short, from all criminal and civil processes at all times.

The duty of a minister is not confined to the transmission of instructions from his government. He should, also, cultivate friendly personal relations with the officers of the government to which he is accredited, so that on proper occasions he may have easy access to them and, having thus gained their confidence in advance, may converse freely with them. It is, therefore, necessary for the ambassador to adapt himself to the life of the official class of the country in which he is stationed. When issues arise between his country and the foreign government, he must endeavor to adjust matters as informally and genially as possible without resorting to any official representations or discussions. The success of a diplomat depends upon the tranquillity which he is able to maintain in the relations of his government with the foreign country.

Downing Street. A street in London on which are situated the Prime Minister's official residence and the residences of many government officials, including the Colonial Office.

Economic Interpretation of History. The theory of the economic interpretation of history rests upon the concept that social progress in general is the result of contending economic interests in society—some favorable, others opposed to change.

Electors, Presidential. The Constitution contains very few clauses with regard to the actual choice of the President. In the first place, it contemplates a system of indirect election; each state shall appoint, in such manner as the legislature thereof may direct, a number of electors equal to the number of Senators and Representatives to which the commonwealth is entitled in Congress. To remove electors from any direct contact with the federal government, it was added that no Senator or Representative or a person holding any office of trust under the United States should be appointed an elector.

The electors chosen by each state at first cast their votes for two persons. Since the adoption of the Twelfth Amendment in 1804, each elector is required to designate his choice for President and Vice President. The vote is sent to the president of the Senate, who, in the presence of both houses of Congress, opens the certificates and counts the ballots from all states.

The choice of the President and Vice President by electors has become a mere form. Since 1800, the electors have exercised no individual judgment, but have followed the dictates of the parties to which they belonged.

Embargo. An order of a country prohibiting vessels or merchandise from leaving its ports. An embargo has as its object that of damaging another country by depriving it of its usual commerce. An embargo may be directed merely against the citizens of the country that has placed it; or it may be directed against some particular foreign power or group of powers, or it may be applied to all nations.

Eminent Domain. The state enjoys and often makes use of the right of eminent domain, by which private real estate may be appropriated for public purposes on payment of a reasonable sum. If an owner of real estate will not accept a price which the government considers reasonable the state submits the matter to a court and lets the court decide what is a suitable price. The right of eminent domain belongs to the states and also to the federal government for federal purposes. The states also allow the local governments to exercise this power for their needs.

Ex Post Facto Law. For many centuries in England and continental Europe, people were punished for acts which were not forbidden by law when the act was committed. This caused much injustice. To prevent this in the United States a clause in the Constitution states that no ex post facto law can be passed either by Congress or the state legislatures.

Extradition. The extradition of criminals, long an international practice based on treaty stipulations between independent countries, was carried over into the federal Constitution by this provision; that any person charged with crime, fleeing from justice and found in another state, shall be delivered upon demand of the executive authority of the state from which he fled, to be removed for trial in the state having jurisdiction of the crime. Chief Justice Taney ruled that the governor of a state is under a moral obligation to surrender criminals, but he may use his discretion in the matter.

Fabianism. A method of bringing about social revolution through the education of public opinion. The Fabian Society was founded in London in 1883 by Sidney and Beatrice Webb, E. R. Pease and other sociologists who have since become famous. George Bernard Shaw joined this society during the first year of its existence. Its aim is "the reconstruction of society in accordance with the highest moral possibilities."

Fascism. Originally an expression of the post-war

restlessness of the demobilized Italian shock-troops This expression of dissatisfaction was directed into organized channels by leaders (of the Fascist party) imbued with doctrines of direct action and violence and inspired by a negative patriotism. Their aim was to nationalize aliens, to destroy Socialism, to curtail the secular influence of the Church and to uproot Pacifism. They hoped, by making use of the discontented middle class element, to create a strong and efficient Italy. In the agrarian districts, this party adopted a program of land subdivisions, and built up its labor organizations on a patriotic appeal for coöperation between capital and labor. It proposes to make Italy supreme in the Mediterranean. The "Black Shirts" began their organized military march on Rome on October 28, 1922. Two days later, Benito Mussolini, leader of the Fascists, was made Premier of Italy, and soon thereafter he was invested with dictatorial powers.

Federal Courts. The Constitution of the United States makes only slight provision for the structure of the federal courts. It merely states that the judicial power of the federal government shall be vested in one Supreme Court and in such inferior courts as Congress may from time to time ordain and establish.

All federal judges are nominated by the President and appointed by and with the advice and consent of the Senate. All federal judges hold office during good behavior and, therefore, cannot be removed except by impeachment.

Congress has set up the following courts:

(1) The Supreme Court is composed of nine judges—a Chief Justice and eight Associate Justices. Six judges must be present at each trial and a majority is necessary for a decision. The salary of the Chief Justice is $20,500 yearly and of the associate justices $20,000. The most important business of this court is questions of Constitutional law brought up from lower federal courts or from state courts.

(2) Immediately under the Supreme Court is a Circuit Court of Appeals in each of the nine circuits into which the United States is divided. In the circuits which have a large amount of business, there are four judges, in the smaller circuits two and in the remainder three. Each of the Justices of the Supreme Court is allotted to one of the nine circuits.

This Court has the right to review the decisions in the lower District courts and its decision is final in practically all cases, in which no question of Constitutional law is involved. However, the Circuit Court may ask the Supreme Court for instructions on any point of law.

(3) The lowest federal tribunal is the District Court. The whole country is divided into some eighty or ninety districts and in each there are one, two, three or four judges, according to the business to be transacted. The jurisdiction of this court is over all questions of federal law, which cannot originate in the Circuit Court of Appeals or in the Supreme Court.

In close relation to the judiciary are the Department of Justice and the United States Attorneys and Marshals. The head of the Department of Justice is the Attorney-General of the United States.

Filibuster. A parliamentary practice used to prolong debate and to prevent a vote. The device of making time-consuming speeches is the usual method followed in filibustering.

Franking Privilege. A privilege given to members of Congress and other branches of the federal government, of sending official mail free of postage charge. A penalty is attached to the use of this right in the private mail of those authorized to use it officially.

Gerrymander. In order that the majority party may secure as many members in Congress as possible, resort has been made to a method of creating Congressional districts called "gerrymandering." This is done by massing the voters of the opposing party in a small number of districts, giving them overwhelming majorities there, while allowing the dominant party to carry the other districts by very small minorities. The same process is often followed in state and municipal politics.

Habeas Corpus. Any person who thinks that he or another person is unjustly imprisoned may represent the facts to a court, which may then issue a writ of habeas corpus, directing whoever may have in custody the person described in the writ to produce such person in open court (unless charged with treason or felony) and state the reason for his detention.

Under our system whenever there is a conflict between the state and federal authorities the matter is settled by the United States Supreme Court.

Habeas corpus may be suspended in case of civil war or of foreign war; it was suspended during the Civil War and more than thirty thousand people were arrested on the responsibility of President Lincoln. Many authorities are of the opinion that the writ can be legally suspended only by an Act of Congress.

Immigration. The immigration law of May 15, 1924, limits the quota of aliens admissible from each country to two per cent of the persons born in that country who resided here in 1890. This ratio was set up to increase the proportion of Nordics. Japanese, Chinese and other yellow races are entirely excluded, while blacks are admitted in small numbers. In the year ending June 30, 1924, 10,114 persons were turned back after arriving at Ellis Island. Under the new law, the Department of Labor issues only enough certificates to cover the quota. During the six months ending December 31, 1924, 4,448 were turned back after arrival. For the fiscal year ending June 30, 1929, 18,127 were debarred.

Organized labor opposes unrestricted immigration. Capitalists desire cheap foreign labor, but fear an influx of Bolshevists. Radicals believe the world should be free for all to move about in as they see fit.

Impeachment. A special method of determining the guilt or the innocence of public officers charged with crime is impeachment. The process is distinctly set forth in the federal Constitution. Under it the House of Representatives "impeaches," that is, by a majority vote it presents articles of accusation. The Senate then tries the officer accused by the House.

Impeachment is the process of bringing an official to trial for removal from office and may either succeed or fail at removal. Thus President Andrew Johnson was impeached, but not convicted. This process is employed in the state governments as well as in the national government.

Income Tax. Because of the difficulties of assessing direct taxes and apportioning them among the states, the Constitutional limitation became almost a prohibition. However, in 1913, after a long agitation over the matter, the Sixteenth Amendment to the Constitution was adopted, authorizing Congress to lay taxes upon private incomes from all sources without reference to any census or enumeration. After the Underwood Tariff Act was passed in 1913, which materially reduced the federal income, Congress levied a tax on incomes to replenish the national treasury.

Industrialism. A general designation for the present stage of industry in this country where large scale enterprise is conducted for profit; where populations crowd into large cities, and where material, rather than aesthetic and spiritual values, have first place in social life.

Initiative. The initiative is a system by which a given number of voters may on petition require the legislature to pass a statute of a designated kind and submit it to popular vote, or may actually draw up a bill in detail and demand a vote upon it.

Injunction. The writ or bill of injunction is an order of court giving orders concerning a matter, and the violation of the order is regarded as contempt of court. Sometimes the injunction takes the form of an order to persons or a corporation to perform certain acts; sometimes the injunction takes the form of a temporary restraining order forbidding a party to alter the existing condition of things in question until the merits of the case may be decided; again it is in the form of a permanent order directing a party not to perform some act, the results of which can not be remedied by any proceeding in law.

Organized labor is opposed to the use of injunctions, because this legal process has been employed so often in labor disputes.

Internationalism. The body of principles which regards the interests of all nations as superior to the interests of any one national group. It differs from cosmopolitanism in that it is compatible with patriotism and with a broad nationalism, seeking not to obliterate distinctions of culture, but to render them supplementary to one another.

I. W. W. The I. W. W., or Industrial Workers of the World, is a radical organization of international scope, which has for its object the improvement of the social and economic conditions of labor. This organization adheres to the principle that the end justifies the means. When occasion demands, intimidation, force or even violence may be employed to accomplish an end that the organization has in view. The method of operation of this organization stands out in contrast to those organizations which favor social and political reform through the orderly process of education.

Juries. A grand jury is composed of a number of citizens ranging from twelve to twenty-three. It holds its sessions either for the purpose of investigating the causes of crimes which have been committed, bringing indictments against those whom jury believes guilty, or in order to investigate the conditions of some department of the government.

A petit jury is usually composed of twelve citizens before whom evidence is submitted in a trial and who render a decision, or verdict, on the basis of the evidence presented. The decision or verdict must be unanimous.

Juvenile Courts. In many of our large cities special courts called Juvenile Courts have been set up for hearing of cases brought against minors. In a Juvenile Court, the child is not treated as a criminal.

The child, with his accuser and sponsors, meet the judge in a rather informal way. The judge has a heart-to-heart talk with the offender, if the judge thinks the child is guilty. If found guilty, the youthful offender is placed upon probation and an effort is made to care for him in such a way that he will develop into a useful citizen.

Lobbying. By the lobby is meant those men, and sometimes women, who make it their business to argue with legislators and to solicit their votes. Some of these lobbyists are paid attorneys of corporations; many of them are former members of Congress, who understand the inner workings of the body. The same influence is often exerted in state and municipal legislative bodies.

Lockout. An employer's strike or temporary closing down of industry in an effort to force the workers to come to terms.

National Banking System of the United States. In addition to gold and silver coins, we have in use several kinds of paper money. Some of these, the gold and silver certificates, are paper substitutes for gold and silver, which is too heavy and bulky for ordinary use. During 1929 the size of the paper certificates was reduced. Another form of paper money which is being retired as rapidly as possible, consists of United States notes, or greenbacks, which were originally issued during the Civil War.

Much of our paper money at present consists of bank notes issued by banks which have been chartered by the national government. Our present national banking system was established in 1863 for the purpose of creating a market for bonds of the United States in order to secure additional funds to finance the Civil War. National banks are permitted to issue notes on the United States bonds which they have bought and deposited with the Treasurer of the United States. Since these notes are secured by government bonds, which are of unquestioned value, they have excellent stability. However, they lack elasticity, for there is a limit to the volume of bonds which the banks have bought and may buy. In order to provide elasticity, which is necessary, as when much currency is required to move the crops in the autumn, the Federal Reserve Act was passed in 1913. Under this act all notes issued by individual banks will be gradually retired and by 1935 they will no longer be in circulation.

The Federal Reserve Act provides for a single Federal Reserve Board, consisting of the Secretary of the Treasury, the Controller of the Currency and five other members appointed by the President and Senate for a term of ten years each. This board has supervision of the Federal Reserve Banks and the administration of the Federal Reserve Act.

The United States is now divided into twelve districts, as shown on the map in our Atlas. In each of these divisions there is a Federal Reserve Bank, which may issue notes in large quantities, but these notes are safeguarded against depreciation by good security. These banks do not do business with the public, but with banks which are members of the Federal Reserve System.

In 1916 a law was passed creating twelve Land Loan Banks, which were placed under a single Federal Board. These banks loan money to associations of farmers at comparatively low rates of interest, to be repaid in installments over a long period of time.

National Nominating Conventions. Political parties and all of the machinery of the parties are extra-legal political institutions. By that we mean that they are not created by any national or state law. They are not recognized as such by law.

The national conventions of the different parties meet in some conveniently located city of importance, usually in June or July. The day and place are decided by the national committee, which consists of one member from each state, elected by the delegates from that state to the national convention, which nominates the candidates for President and Vice President. In fact, the national committee really manages the convention, because if any state sends two sets of delegates to the same party convention, it decides in advance which delegates are entitled to seats in the convention. In doing this it usually favors its friends.

After the convention has adopted a platform setting forth the principles of the party the roll of the states is called in alphabetical order and nominations are then made. Even when there is no doubt about which Presidential candidate will be selected, the names of favorite sons from different states are often placed in nomination out of respect for them. Usually from five to ten names are placed, each of which is nominated in a laudatory speech. After the nominations have been closed the roll of the states is again called and the chairman of each delegation announces its vote. After the candidate for President has been selected, the convention proceeds to choose a nominee for Vice President.

The Republican convention requires only a majority vote of the delegates to elect, while the Democratic requires two-thirds. If no nominee receives the requisite majority on the first ballot the process is repeated until some one secures the proper number of votes.

Naturalization. Naturalization is the acquirement of citizenship. In the United States an alien can become an American citizen in five years. At any time he may declare his intention of becoming a citizen. He must do this before a federal court. Not less than two years later, nor more than seven years later, if he has resided in this country at least five years altogether, he must go before a federal court or a state court of record, forswear his allegiance to the country of which he was formerly a citizen and prove to the satisfaction of the court that he is of good moral character, not an anarchist and will obey the Constitution. His naturalization includes also his minor children. Since 1922 a wife may be naturalized on her own account by fulfilling the usual requirements, provided her husband is eligible to become naturalized.

Nihilism. The name applied to a small group of extreme anarchists and revolutionists in Russia during the Czarist regime. They believed in the complete overthrow of all forms of the existing order and, at times, preached the need for the assassination of high officials in the Russian government as one of the means of attaining these ends.

Non-Resistance. The literal fulfillment of the precept, "Resist not evil, but overcome evil with good." The non-resistance theory opposes all war, and sometimes also the strike and the boycott.

Open Shop. A shop where either union or non-union workers are employed—often together and on the same terms.

Orangemen. The name given about the end of the seventeenth century by Roman Catholics to Protestants in Ireland, on account of their support of William III, Prince of Orange.

Pacifism. An attitude of extreme opposition to war. Some pacifists, like Tolstoy, teach the doctrine of complete non-resistance; others admit the justice of defense, but oppose all forms of preparation for national defense.

Pan-Americanism. The doctrine that the nations of the American hemisphere have common interests and institutions not generally shared by the people of the rest of the world, and that these should be the bases of a common understanding and of common political and commercial actions among American governments.

Party Whip. A member of a legislative body assigned by the party to secure the votes of legislators on important measures and to hold them in line with party policy.

Peonage. A system of compulsory labor enforced by means of keeping the worker in a state of indebtedness to the master. It is practiced extensively in Latin America.

Picketing. The patrolling of the avenues of approach to a shop where a strike is in progress, for the purposes of inducing workers to refuse to work for an "unfair" employer. Picketing is legal in most states of the union, if persuasion only is involved. Time and again, however, courts have held that picketing which involves even a possibility of coercion is illegal and can be enjoined.

Pigeonholing. The laying aside of a bill or other matter by a legislative committee, apparently for future consideration, but in reality with the intent of allowing the measure to die through failure to act upon it. Similar action is often taken by an executive, because it is equivalent to a veto.

Plurality. A plurality is the number of votes secured by a successful candidate in excess of the number cast for the next highest candidate for office. The election laws may be so formed that a plurality vote may elect. If there are more than two candidates, it may happen that a candidate is elected even though he fails to obtain a majority of the total number of votes cast.

Political "Boss." The "boss" in politics is a man who concerns himself very little with policies and very much with the bringing together of a majority which will enable him to keep his friends in office. He has no concern for the service which the government should render to the public. He is interested in government in order to get therefrom all that he can for himself and his friends.

Political Parties. The political forces by which our government is operated are the political parties. In all forms of popular government, wherever men are striving to govern themselves and to realize government by the people, political parties exist. People divide according to their views on public measures. Our parties of today have for their avowed purpose the solving of our national and state problems by putting into operation the principles for which the party stands, which are maintained to be fundamental for the nation's peace and prosperity. The state and national platforms of each party formulate the principles each party holds relative to the political problems of the country.

Presidential Succession. Upon the death of the President of the United States he is succeeded by the Vice President and the Vice Presidency remains vacant until the next Presidential election. In case of death or disability of the Vice President the Presidency is filled by a member of the Cabinet in the following order: Secretary of State, Treasury, War, Attorney-General, Postmaster-General, Secretary of the Navy, Interior, Agriculture, Commerce and Labor.

Primaries. At the present time practically all states of the United States provide that nominations for elective officers shall be made, not by conventions of party delegates nor by a caucus of political leaders, but by the voters in direct elections.

A few weeks before an election, on a day set by law, an election is held similar to a regular election. Instead of having a single ballot for all parties, each party has a separate ballot, and, in some states, separate dates for the primary election. Only those voters are allowed to take part in this election who have affiliated themselves openly with some party. The object of the direct primary is to place more responsibility in selecting public officials in the hands of the voters and less power in the hands of politicians.

Progressive. A progressive is an individual who believes that the proper solution of political and social problems is to be found by progressively improving present conditions.

Radical. A radical is one who believes that political development should be made by extreme departure from the present political and social notions. The radical contends that our present political ideals and institutions are the product of an unscientific past and that there should be a complete readjustment in harmony with the latest discoveries of political and social science.

Reciprocity. A reciprocal agreement between two nations especially for mutual tariff concessions.

Referendum. The referendum is the process whereby laws may be enacted or unpopular laws done away with by the direct vote of the people. If a state law has been proposed by iniatiative and the legislature has neglected to act upon it a referendum vote on it may be taken at the next election. On the other hand, if the legislature has passed a law which is disapproved by many people they can, on petition, temporarily suspend the law and compel the state to submit it to popular vote. The State of Oregon has made the most use of the referendum.

Rider. A measure, doubtful of passage or of executive approval, attached to a bill which is sure of passage or approval, such as an appropriation bill, in order that the doubtful measure may "ride in" with the main bill. This procedure is often effective in the federal government because the United States cannot veto a part of a bill without invalidating all of it. However, in many states, the governor now has the authority to veto a part of a bill and approve the remainder.

Sabotage. A term applied to the conscious effort of the worker, while remaining at work, to injure the interest of his employer. Workers have sabotaged the employer (1) by loafing while employed, (2) by insisting on carrying out to the letter company or government regulations, (3) by producing an inferior quality of goods, (4) by misdirecting packages, (5) by annoying customers and (6) by stopping or injuring machinery. The object of sabotage is so to injure the business of the employer as to cause him to grant certain concessions to the workers.

Scab. A term used by American trade-unionists to designate one who has been disloyal to the union. Usually the term is applied to one who takes the place of a worker out on strike.

Scratching. A method of voting whereby the voter instead of voting a straight ticket marks out from the party ballot one or more of the regularly nominated candidates.

Short Ballot. Since it is practically impossible for even the most intelligent voter to inform himself on the merits of so many candidates as we now have for public offices, there has been in recent years a strong tendency to simplify the ballot. The short ballot advocates believe that public officials whose duties are entirely administrative should be appointed by some responsible person who can judge the fitness of the applicants for that work better than it can be determined by the average voter. Of course, the public under this system retains indirect control of these administrative officials inasmuch as it elects the persons who appoint them.

Single Tax. It is a well known fact that the value of ground in our large cities increases with astonishing rapidity, not through the effort of the owners, but through the growth of industry and population. In view of this fact Henry George advocated the idea that a single tax on the unearned increase on land values would be the most equitable form of taxation and would solve many of the economic problems of today. Some authorities on taxation today advocate a single tax on incomes.

Smuggling. The illegal importing of goods into a country without submitting them to the customs authorities and paying the duties imposed by law.

Socialism. Socialism is the political doctrine that advocates the further extension of the authority of the State, until the State owns all means of production and reshapes human society upon new and better lines for the well being of all the people.

Socialization. As generally interpreted, socialization means the transfer of industry from private to social ownership. Social ownership might take the form either of ownership by the nation, the state, the municipality, or by voluntary coöperative groups. The word as used in America generally includes in its meaning a plan for democracy of administration. It is also used rather vaguely by certain economists to describe a general trend toward a more social point of view in industry, or a wider participation of the worker in the ownership of stock in corporations.

Soviet. A soviet or council, is a political body made up of delegates from trades, factories, industrial and professional groups. The Russian Soviet provides a means for direct proportional representation on the basis of occupation rather than residence.

Spoils System and Civil Service Reform. From the time of President Jackson to President Arthur the whole Civil Service was demoralized every four years by wholesale political removals, and even more recently the federal service has been weakened by unnecessary removals from office. However, since 1871, the President has been authorized to prescribe regulations for the admission of persons into the Civil Service and to ascertain the fitness of each candidate. Under the new system an employee can not be removed except for cause.

The several states in varying degrees have followed the example set by the national government.

State Courts. The state courts are the great tribunals of the citizen for the protection of his personal and property rights.

At the bottom of the state judiciary, stand the justices of the peace, who have jurisdiction over civil cases involving very small amounts and petty offences. In large cities, the police courts handle petty criminal matters and the municipal civil courts take care of minor civil actions.

In most states there are county courts. They have jurisdiction over actions involving considerable sums and usually are appellate courts from the justices of the peace. They usually have jurisdiction over most criminal matters of a serious nature.

Often there is a superior, circuit or district court immediately above the county court, which has unlimited original jurisdiction and may try all cases over which the lower courts have no jurisdiction.

At the head of the judiciary of each state, stands the appellate court of last resort, which ordinarily deals only with appeals on points of law and not of fact. Various names are applied to this court in different states, such as supreme court, court of appeals, court of errors and appeals or supreme judicial court.

Statute of Limitations. A law which states a definite limit of time within which a legal right or remedy must be prosecuted in the courts, or be barred for any action in the future. This principle of law is intended to protect the individual against state demands when, from lapse of time, death of witnesses, failure of memory or other causes, the true facts of a case may be obscured.

Steam Roller. A term used to describe the manner in which the faction in control of a political convention or legislative body may force through a program previously determined upon.

Steering Committee. The Speaker of the House of Representatives and two members, one of whom is usually the chairman of the Ways and Means Committee, assume the same kind of leadership that in England is taken by the ministry. Since they can answer only for the lower House, the complete working out of the system requires what is called the "Steering Committee" an unofficial conclave of members of the Senate and the House. As guides to the majority, the Steering Committee practically decide what measure to press to a vote and what measures to drop; from this it has been a short step for it also to decide what kind of party measures shall be introduced and what shall be their text.

Strike. A concentrated withdrawal from work on the part of the workers for the purpose of securing certain specified ends, such as better wages, shorter hours, union recognition, greater control of shop conditions or of aiding other workers. Strikes for the improvement of conditions of the workers involved are legal. Sympathetic strikes and strikes for closed shops, under certain conditions, have been generally regarded as illegal.

Suffrage. Under our constitutional system, the regulation of the suffrage is left to the states. The federal Constitution avoided the creation of a uniform national suffrage by requiring that voters for Presidential electors and representatives should be the same as those for the most numerous branch of the state legislatures. Under this arrangement every enlargement of the state suffrage was a corresponding extension of national suffrage in that state. Of course, the Nineteenth Amendment to the Constitution grants suffrage to women in every state.

In the states there are three practically universal requirements for voters. The first is residence, which provides that a person must be a bona fide resident of the precinct, county and state in which he wishes to cast his vote. The second is an age requirement of twenty-one years. The third requirement is that of citizenship.

All classes on which the right to vote is not directly conferred are debarred from voting. In addition, persons who are insane or incompetent or convicted of crime are denied the right of voting. Some states require all voters to be able to read and write. A few Southern states have adopted "grandfather clauses," to exclude negroes from voting. These states provide that any person who failed to meet the requirements for voting—ability to read or possession of property—should not be excluded, if he or one of his ancestors had voted before 1867.

Sweat Shop. A place where work is conducted under subnormal working conditions, where wages are usually inadequate, working conditions unsanitary, hours long and so forth. Rooms in tenement houses are often utilized as sweat shops.

Tariff. Alexander Hamilton, as first Secretary of the Treasury of the United States, secured the passage of a tariff for the protection of American industries and brought money into the empty federal treasury. The farming and planting South, except a few of the large towns, presented an almost solid front against the tariff. Here we have the beginning of the tariff controversy, which has lasted to our day. On the one hand, we find the industrial sections favoring a high protective tariff; on the other, the agrarians and producers of raw material are in favor of a low tariff. The Republican party at present champions a high protective tariff, while the Democratic party advocates a tariff primarily for revenue, with slight protection to American business interests.

The Trust. The popular conception of a trust is a large business organization that has control of some important industry. Legally and historically this is not true.

In 1892, a group of oil interests founded an organization, placing all their stocks in the hands of trustees, among whom was John D. Rockefeller. The trustees, in turn, issued certificates representing the share to which each participant was entitled and took over the management of the entire business. This was the origin of the "trust."

Legally there is no such thing as a "trust" at the present time, for the Supreme Court has declared that a combination that creates monopoly, unless it is under control of the government, is illegal.

Ultimatum. The final step in the negotiations between two Powers setting forth the minimum terms one Power is prepared to accept, the rejection of which may involve an immediate rupture of diplomatic relations and may lead to a declaration of war.

DECLARATION OF INDEPENDENCE

IN CONGRESS, JULY 4, 1776

THE UNANIMOUS DECLARATION OF THE THIRTEEN UNITED STATES OF AMERICA

(*Literal Print*)

When in the Course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness.

That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed.

That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same Object evinces a design to reduce them under absolute Despotism, it is their right, it is their duty, to throw off such Government, and to provide new Guards for their future security.

Such has been the patient sufferance of these Colonies; and such is now the necessity which constrains them to alter their former Systems of Government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute Tyranny over these States. To prove this, let Facts be submitted to a candid world.

He has refused his Assent to Laws, the most wholesome and necessary for the public good.

He has forbidden his Governors to pass Laws of immediate and pressing importance, unless suspended in their operation till his Assent should be obtained; and when so suspended, he has utterly neglected to attend to them.

He has refused to pass other Laws for the accommodation of large districts of people, unless those people would relinquish the right of Representation in the Legislature, a right inestimable to them and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public Records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.

He has refused for a long time, after such dissolutions, to cause others to be elected; whereby the Legislative powers, incapable of Annihilation, have returned to the People at large for their exercise; the State remaining in the mean time exposed to all the dangers of invasion from without, and convulsions within.

He has endeavoured to prevent the population of these States; for that purpose obstructing the Laws for Naturalization of Foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new Appropriations of Lands.

He has obstructed the Administration of Justice, by refusing his Assent to Laws for establishing Judiciary powers.

He has made Judges dependent on his Will alone, for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of New Offices, and sent hither swarms of Officers to harass our people, and eat out their substance.

He has kept among us, in times of peace, Standing Armies without the Consent of our legislatures.

He has affected to render the Military independent of and superior to the Civil power.

He has combined with others to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his Assent to their Acts of pretended Legislation:

For quartering large bodies of armed troops among us.

For protecting them, by a mock Trial, from punishment for any Murders which they should commit on the Inhabitants of these States:

For cutting off our Trade with all parts of the world:

For imposing Taxes on us without our consent:

For depriving us in many cases, of the benefits of Trial by jury:

For transporting us beyond Seas to be tried for pretended offences:

For abolishing the free System of English Laws in a neighboring Province, establishing therein an Arbitrary government, and enlarging its Boundaries so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies:

For taking away our Charters, abolishing our most valuable Laws, and altering fundamentally the Forms of our Governments:

For suspending our own Legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated Government here, by declaring us out of his Protection and waging War against us.

He has plundered our seas, ravaged our Coasts, burnt our towns, and destroyed the lives of our people.

He is at this time transporting large Armies of foreign Mercenaries to compleat the works of death, desolation and tyranny, already begun with circumstances of Cruelty & perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the Head of a civilized nation.

He has constrained our fellow Citizens taken Captive on the high Seas to bear Arms against their Country, to become the executioneers of their friends and Brethren, or to fall themselves by their Hands.

He has excited domestic insurrections amongst us, and has endeavoured to bring on the inhabitants of our frontiers, the merciless Indian Savages, whose known rule of warfare, is an undistinguished destruction of all ages, sexes and conditions. In every stage of these Oppressions We Have Petitioned for Redress in the most humble terms: Our repeated Petitions have been answered only by repeated injury. A Prince, whose character is thus marked by every act which may define a Tyrant, is unfit to be the ruler of a free people. Nor have We been wanting in attentions to our British brethren. We have warned them from time to time of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which, would inevitably interrupt our connections and correspondence. They too have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity, which denounces our Separation, and hold them, as we hold the rest of mankind, Enemies in War, in Peace Friends.

We, therefore, the Representatives of the United States of America, in General Congress, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the Name, and by authority of the good People of these Colonies, solemnly publish and declare, That these United Colonies are, and of Right ought to be Free and Independent States; that they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the State of Great Britain, is and ought to be totally dissolved; and that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do.

And for the support of this Declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other our Lives, our Fortunes and our sacred Honor.

NOTE: The signers, with important data about them, are given in the following table:

SIGNERS OF THE DECLARATION OF INDEPENDENCE

Name	Order*	Colony	Occupation	Born	Birthplace	Died	Age†
Adams, John	6	Massachusetts Bay	Lawyer	Oct. 30, 1735	Quincy, Mass.	July 4, 1826	90

*Order in which they signed. †Age at death.

ARTICLES OF CONFEDERATION

TO ALL TO WHOM THESE PRESENTS SHALL COME, WE THE UNDERSIGNED DELEGATES OF THE STATES AFFIXED TO OUR NAMES, SEND GREETING:

Whereas the delegates of the United States of America in Congress assembled did on the 15th day of November in the year of our Lord 1777, and in the second year of the independence of America agree to certain Articles of Confederation and perpetual union between the States of New Hampshire, Massachusetts Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina and Georgia, in the words following, viz.:

ARTICLES OF CONFEDERATION AND PERPETUAL UNION BETWEEN THE STATES OF NEW HAMPSHIRE, MASSACHUSETTS BAY, RHODE ISLAND AND PROVIDENCE PLANTATIONS, CONNECTICUT, NEW YORK, NEW JERSEY, PENNSYLVANIA, DELAWARE, MARYLAND, VIRGINIA, NORTH CAROLINA, SOUTH CAROLINA, AND GEORGIA.

ARTICLE I.

The style of this confederacy shall be "The United States of America."

ARTICLE II.

Each State retains its sovereignty, freedom and independence, and every power, jurisdiction and right, which is not by this confederation expressly delegated to the United States, in the Congress assembled.

ARTICLE III.

The said States hereby severally enter into a firm league of friendship with each other, for their common defense, the security of their liberties, and their mutual and general welfare, binding themselves to assist each other, against all force offered to, or attacks made upon the, or any of them, on account of religion, sovereignty, trade, or any other pretense whatever.

ARTICLE IV.

The better to secure and perpetuate mutual friendship and intercourse among the people of the different States in this union, the free inhabitants of each of these States, paupers, vagabonds, and fugitives from justice excepted, shall be entitled to all privileges and immunities of free citizens in the several States; and the people of each State shall have free ingress and regress to and from any other State, and shall enjoy therein all the privileges of trade and commerce, subject to the same duties, impositions and restrictions as the inhabitants thereof respectively, provided that such restriction shall not extend so far as to prevent the removal of property imported into any State, to any other State of which the owner is an inhabitant; provided also that no imposition, duties or restrictions shall be laid by any State, on the property of the United States, or either of them.

If any person guilty of, or charged with treason, felony, or other high misdemeanor in any State, shall flee from justice, and be found in any of the United States, he shall upon demand of the Governor or executive power, of the State from which he fled, be delivered up and removed to the State having jurisdiction of his offense.

Full faith and credit shall be given in each of these States to the records, acts and judicial proceedings of the courts and magistrates of every other State.

ARTICLE V.

For the more convenient management of the general interest of the United States, delegates shall be annually appointed in such manner as the legislature of each State shall direct, to meet in Congress on the first Monday in November, in every year, with a power reserved to each State, to recall its delegates, or any of them, at any time within the year, and to send others in their stead, for the remainder of the year.

No State shall be represented in Congress by less than two, nor by more than seven members; and no person shall be capable of holding any office under the United States, for which he, or another for his benefit receives any salary, fees or emolument of any kind.

Each State shall maintain its own delegates in any meeting of the States, and while they act as members of the committee of the States.

In determining questions in the United States, in Congress assembled, each State shall have one vote.

Freedom of speech and debate in Congress shall not be impeached or questioned in any court, or place out of Congress, and the members of Congress shall be protected in their persons from arrests and imprisonments, during the time of their going to and from, and attendance on Congress, except for treason, felony, or breach of the peace.

ARTICLE VI.

No State without the consent of the United States in Congress assembled, shall send any embassy to, or receive any embassy from, or enter into any conference, agreement, alliance or treaty with any king, prince or State; nor shall any person holding any office of profit or trust under the United States, or any of them, accept of any present, emolument, office or title of any kind whatever from any king, prince or foreign State; nor shall the United States in Congress assembled, grant any title of nobility.

No two or more States shall enter into any treaty, confederation or alliance whatever between them, without the consent of the United States in Congress assembled, specifying accurately the purposes for which the same is to be entered into, and how long it shall continue.

No State shall lay any imposts or duties, which may interfere with any stipulation in treaties, entered into by the United States in Congress assembled, with any king, prince or State, in pursuance of any treaties already proposed by Congress, to the courts of France and Spain.

No vessels of war shall be kept up in time of peace by any State, except such number only, as shall be deemed necessary by the United States in Congress assembled, for the defense of such State, or its trade; nor shall any body of forces be kept up by any State, in time of peace, except such number only, as in the judgment of the United States, in Congress assembled, shall be deemed requisite to garrison the forts necessary for the defense of such State; but every State shall always keep up a well regulated and disciplined militia, sufficiently armed and accoutred, and shall provide and have constantly ready for use, in public stores, a due number of field pieces and tents, and a proper quantity of arms, ammunition and camp equipage.

No State shall engage in any war without the consent of the United States in Congress assembled, unless such State be actually invaded by enemies, or shall have received certain advice of a resolution being formed by some nation of Indians to invade such State, and the danger is so imminent as not to admit of a delay, till the United States in Congress assembled can be consulted: nor shall any State grant commissions to any ships or vessels of war, nor letters of marque or reprisal, except it be after a declaration of war by the United States in Congress assembled, and then only against the kingdom or State and the subjects thereof, against which war has been so declared, and under such regulations shall be established by the United States in Congress assembled, unless such State be infested by pirates, in which case vessels of war may be fitted out for that occasion, and kept so long as the danger shall continue, or until the United States in Congress assembled shall determine otherwise.

ARTICLE VII.

When land forces are raised by any State for the common defense, all officers of or under the rank of colonel, shall be appointed by the legislature of each State respectively by whom such forces shall be raised, or in such manner as such State shall direct, and all vacancies shall be filled up by the State which first made the appointment.

ARTICLE VIII.

All charges of war, and all other expenses that shall be incurred for the common defense or general welfare, and allowed by the United States in Congress assembled, shall be defrayed out of a common treasury, which shall be supplied by the several States, in proportion to the value of all land within each State, granted to or surveyed for any person, as such land and the buildings and improvements thereon shall be estimated according to such mode as the United States in Congress assembled, shall from time to time, direct and appoint.

The taxes for paying that proportion shall be laid and levied by the authority and direction of the legislatures of the several States within the time agreed upon by the United States in Congress assembled.

ARTICLE IX.

The United States in Congress assembled, shall have the sole and exclusive right and power of determining on peace and war, except in the cases mentioned in the sixth article—of sending and receiving ambassadors

—entering into treaties and alliances, provided that no treaty of commerce shall be made whereby the legislative power or the respective States shall be restrained from imposing such imposts and duties on foreigners, as their own people are subjected to, or from prohibiting the exportation or importation of any species of goods or commodities whatsoever—of establishing rules for deciding in all cases, what captures on land or water shall be legal, and in what manner prizes taken by land or naval forces in the service of the United States shall be divided or appropriated—of granting letters of marque and reprisal in times of peace—appointing courts for the trial of piracies and felonies committed on the high seas and establishing courts for receiving and determining final appeals in all cases of capture, provided that no member of Congress shall be appointed a judge of any of the said courts.

The United States in Congress assembled shall also be the last resort on appeal in all disputes and differences now subsisting or that hereafter may arise between two or more States concerning boundary, jurisdiction or any other cause whatever; which authority shall always be exercised in the manner following. Whenever the legislative or executive authority or lawful agent of any State in controversy with another shall present a petition to Congress, stating the matter in question and praying for a hearing, notice thereof shall be given by order of Congress to the legislative or executive authority of the other State in controversy, and a day assigned for the appearance of the parties by their lawful agents, who shall then be directed to appoint by joint consent, commissioners or judges to constitute a court for hearing and determining the matter in question: but if they cannot agree, Congress shall name three persons out of each of the United States, and from the list of such persons each party shall alternately strike out one, the petitioners beginning, until the number shall be reduced to thirteen; and from that number not less than seven, nor more than nine names as Congress shall direct, shall in the presence of Congress be drawn out by lot, and the persons whose names shall be so drawn or any five of them, shall be commissioners or judges, to hear and finally determine the controversy, so always as a major part of the judges who shall hear the cause shall agree in the determination: and if either party shall neglect to attend at the day appointed, without showing reasons, which Congress shall judge sufficient, or being present shall refuse to strike, the Congress shall proceed to nominate three persons out of each State, and the secretary of Congress shall strike in behalf of such party absent or refusing; and the judgment and sentence of the court to be appointed, in the manner before prescribed, shall be final and conclusive; and if any of the parties shall refuse to submit to the authority of such court, or to appear or defend their claim or cause, the court shall nevertheless proceed to pronounce sentence, or judgment, which shall in like manner be final and decisive, the judgment or sentence and other proceedings being in either case transmitted to Congress and lodged among the acts of Congress for the security of the parties concerned: provided that every commissioner, before he sits in judgment, shall take an oath to be administered by one of the judges of the supreme or superior court of the State, where the cause shall be tried, "well and truly to hear and determine the matter in question, according to the best of his judgment, without favor, affection or hope of reward": provided also that no State shall be deprived of territory for the benefit of the United States.

All controversies concerning the private right of soil claimed under different grants of two or more States, whose jurisdictions as they may respect such lands, and the States which passed such grants are adjusted, the said grants or either of them being at the same time claimed to have originated antecedent to such settlement of jurisdiction, shall on the petition of either party to the Congress of the United States, be finally determined as near as may be in the same manner as is before prescribed for deciding disputes respecting territorial jurisdiction between different States.

The United States in Congress assembled shall also have the sole and exclusive right and power of regulating the alloy and value of coin struck by their own authority, or by that of the respective States—fixing the standard of weights and measures throughout the United States—regulating the trade and managing all affairs with the Indians, not members of any of the States, provided that the legislative right of any State within its own limits be not infringed or violated—establishing or regulating post offices from one State to another, throughout all the United States, and exacting such postage on the papers passing through the same as may be requisite to defray the expenses of the said office—appointing all officers of the land forces, in the service of the United States, excepting regimental officers—appointing all the officers of the naval forces, and commissioning all officers whatever in the service of the United States—making rules for the government and regulation of the said land and naval forces, and directing their operations.

The United States in Congress assembled shall have authority to appoint a committee, to sit in the recess of Congress, to be denominated "A Committee of the States," and to consist of one delegate from each state; and to appoint such other committees and civil officers as may be necessary for managing the general affairs of the United States under their direction—to appoint one of their number to preside, provided that no person be allowed to serve in the office of president more than one year in any term of three years; to ascertain the necessary sums of money to be raised for the service of the United States, and to appropriate and apply the same for defraying the public expenses—to borrow money, or emit bills on the credit of the United States, transmitting every half year to the respective States an account of the sums of money so borrowed or emitted—to build and equip a navy—to agree upon the number of land forces, and to make requisitions from each State for its quota, in proportion to the number of white inhabitants in such State; which requisition shall be binding, and thereupon the legislature of each State shall appoint the regimental officers, raise the men and clothe, arm and equip them in a soldierlike manner, at the expense of the United States; and the officers and men so clothed, armed and equipped shall march to the place appointed, and within the time agreed on by the United States in Congress assembled: But if the United States in Congress assembled shall, on consideration of circumstances judge proper that any State should not raise men, or should raise a smaller number than its quota, and that any other State should raise a greater number of men than the quota thereof, such extra number shall be raised, officered, clothed, armed and equipped in the same manner as the quota of such State, unless the legislature of such State shall judge that such extra number cannot be safely spared out of the same, in which case they shall raise, officer, clothe, arm and equip as many of such extra number as they judge can be safely spared. And the officers and men so clothed, armed and equipped, shall march to the place appointed, and within the time agreed on by the United States in Congress assembled.

The United States in Congress assembled shall never engage in a war, nor grant letters of marque and reprisal in time of peace, nor enter into any treaties or alliances, nor coin money, nor regulate the value thereof, nor ascertain the sums and expenses necessary for the defense and welfare of the United States, or any of them, nor emit bills, nor borrow money on the credit of the United States, nor appropriate, nor agree upon the number of vessels of war, to be built or purchased, or the number of land or sea forces to be raised, nor appoint a commander in chief of the army or navy, unless nine States assent to the same: nor shall a question on any other point, except for adjourning from day to day be determined, unless by the votes of a majority of the United States in Congress assembled.

The Congress of the United States shall have power to adjourn to any time within the year, and to any place within the United States, so that no period of adjournment be for a longer duration than the space of six months, and shall publish the journal of their proceedings monthly, except such parts thereof relating to treaties, alliances or military operations, as in their judgment require secrecy; and the yeas and nays of the delegates of each State on any question shall be entered on the journal, when it is desired by any delegate; and the delegates of a state or any of them, at his or their request shall be furnished with a transcript of the said journal, except such parts as are above excepted, to lay before the legislatures of the several States.

ARTICLE X.

The committee of the States, or any nine of them, shall be authorized to execute, in the recess of Congress, such of the powers of Congress as the United States in Congress assembled, by the consent of nine States, shall from time to time think expedient to vest them with; provided that no power be delegated to said committee, for the exercise of which, by the Articles of Confederation, the voice of nine States in the Congress of the United States assembled is requisite.

ARTICLE XI.

Canada acceding to this Confederation, and joining in the measures of the United States shall be admitted into, and entitled to all the advantages of this union: but no other colony shall be admitted into the same unless such admission be agreed to by nine States.

ARTICLE XII.

All bills of credit emitted, moneys borrowed and debts contracted by, or under the authority of Congress, before the assembling of the United States, in pursuance of the present Confederation, shall be deemed and considered as a charge against the United States, for payment and satisfaction whereof the said United States and the public faith are hereby solemnly pledged.

ARTICLE XIII.

Every State shall abide by the determinations of the United States in Congress assembled, on all questions which by this Confederation is submitted to them. And the articles of this Confederation shall be inviolably observed by every State, and the union shall be perpetual; nor shall any alteration at any time hereafter be made in any of them; unless such alteration be agreed to in a Congress of the United States and be afterwards confirmed by the legislatures of every State.

And whereas it hath pleased the Great Governor of the World to incline the hearts of the legislatures we respectively represent in Congress, to approve of, and to authorize us to ratify the said Articles of Confederation and perpetual union. Know ye that we the undersigned delegates, by virtue of the power and authority to us given for that purpose, do by these presents, in the name and in behalf of our respective constituents, fully and entirely ratify and confirm each and every of the said Articles of Confederation and perpetual union, and all and singular the matters and things therein contained: And we do further solemnly plight and engage the faith of our respective constituents, that they shall abide by the determinations of the United States in Congress assembled, on all questions which by the said Confederation are submitted to them. And that the articles thereof shall be inviolably observed by the States we respectively represent, and that the union shall be perpetual.

In witness whereof we have hereunto set our hands in Congress. Done at Philadelphia in the State of Pennsylvania the ninth day of July in the year of our Lord, 1778, and in the third year of the independence of America.

State of New Hampshire—Josiah Bartlett, John Wentworth, Jun., August 8, 1778; State of Massachusetts Bay—John Hancock, Samuel Adams, Elbridge Gerry, Francis Dana, James Lovell, Samuel Holten; State of Rhode Island and Providence Plantations—William Ellery, Henry Marchant, John Collins; State of Connecticut—Roger Sherman, Samuel Huntington, Oliver Wolcott, Titus Hosmer, Andrew Adams; State of New York—James Duane, Fraser Lewis, William Duer, Gouverneur Morris; State of New Jersey—John Witherspoon, Nathaniel Scudder, November 28, 1778; State of Pennsylvania—Robert Morris, Daniel Roberdeau, Jonathan Bayard Smith, William Clingan, Joseph Reed, July 22, 1778; State of Delaware—John Dickinson, May 5, 1779, Nicholas Van Dyke, Thomas M'Kean, February 12, 1779; State of Maryland—John Hanson, March 1, 1781, Daniel Carroll, March 1, 1781; State of Virginia—Richard Henry Lee, John Banister, Thomas Adams, John Harvie, Francis Lightfoot Lee; State of North Carolina—John Penn, July 21, 1778; Cornelius Harnett, John Williams; State of South Carolina—Henry Laurens, William Henry Drayton, John Matthews, Richard Hutson, Thomas Heyward, Jun.; State of Georgia—John Walton, July 24, 1778, Edward Telfair, Edward Langworthy.

CONSTITUTION OF THE UNITED STATES

PREAMBLE

WE, the people of the United States, in order to form a more perfect Union, establish justice, insure domestic tranquility, provide for the common defence, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America.

ARTICLE I.

SECTION 1. (Legislative powers; in whom vested.) All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

SECTION 2. (House of Representatives, how and by whom chosen. Qualifications of a Representative. Representatives and direct taxes, how apportioned. Enumeration. Vacancies to be filled. Power of choosing officers, and of impeachment.)

1. The House of Representatives shall be composed of members chosen every second year by the people of the several States, and the electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislature.

2. No person shall be a Representative who shall not have attained to the age of twenty-five years and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State in which he shall be chosen.

3. Representatives and direct taxes* shall be apportioned among the several States which may be included within this Union according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons. The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of Representatives shall not exceed one for every thirty thousand, but each State shall have at least one Representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to choose 3; Massachusetts, 8; Rhode Island and Providence Plantations, 1; Connecticut, 5; New York, 6; New Jersey, 4; Pennsylvania, 8; Delaware, 1; Maryland, 6; Virginia, 10; North Carolina, 5; South Carolina, 5, and Georgia 3.

4. When vacancies happen in the representation from any State, the Executive Authority thereof shall issue writs of election to fill such vacancies.

5. The House of Representatives shall choose their Speaker and other officers, and shall have the sole power of impeachment.

SECTION 3. (Senators, how and by whom chosen. How classified. State Executive, when to make temporary appointments, in case, etc. Qualifications of a Senator. President of the Senate, his right to vote. President pro tem., and other officers of the Senate, how chosen. Power to try impeachments. When President is tried, Chief Justice to preside. Sentence.)

1. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six years; and each Senator shall have one vote.

2. Immediately after they shall be assembled in consequence of the first election, they shall be divided as equally as may be into three classes. The seats of the Senators of the first class shall be vacated at the expiration of the second year, of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one-third may be chosen every second year; and if vacancies happen by resignation, or otherwise, during the recess of the Legislature of any State, the Executive thereof may make temporary appointments until the next meeting of the Legislature, which shall then fill such vacancies.†

3. No person shall be a Senator who shall not have attained to the age of thirty years, and been nine years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State for which he shall be chosen.

4. The Vice President of the United States shall be President of the Senate, but shall have no vote unless they be equally divided.

5. The Senate shall choose their other officers, and also a President pro tempore, in the absence of the Vice President, or when he shall exercise the office of President of the United States.

6. The Senate shall have the sole power to try all impeachments. When sitting for that purpose, they shall be on oath or affirmation. When the President of the United States is tried, the Chief Justice shall preside; and no person shall be convicted without the concurrence of two-thirds of the members present.

*Partly superseded by Article XIV, Amendments.

†See Article XVII, Amendments.

7. Judgment in cases of impeachment shall not extend further than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the United States; but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment and punishment, according to law.

SECTION 4. (Times, etc., of holding elections, how prescribed. One session in each year.)

1. The times, places and manner of holding elections for Senators and Representatives shall be prescribed in each State by the Legislature thereof; but the Congress may at any time by law make or alter such regulations, except as to places of choosing Senators.

2. The Congress shall assemble at least once in every year, and such meeting shall be on the first Monday in December, unless they shall by law appoint a different day.

SECTION 5. (Membership. Quorum. Adjournments. Rules. Power to punish or expel. Journal. Time of adjournments, how limited, etc.)

1. Each House shall be the judge of the elections, returns and qualifications of its own members, and a majority of each shall constitute a quorum to do business; but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members in such manner and under such penalties as each House may provide.

2. Each House may determine the rules of its proceedings, punish its members for disorderly behavior, and with the concurrence of two-thirds expel a member.

3. Each House shall keep a journal of its proceedings, and from time to time publish the same, excepting such parts as may in their judgment require secrecy; and the yeas and nays of the members of either House on any question shall, at the desire of one-fifth of those present, be entered on the journal.

4. Neither House, during the session of Congress, shall, without the consent of the other, adjourn for more than three days, nor to any other place than that in which the two Houses shall be sitting.

SECTION 6. (Compensation. Privileges. Disqualification in certain cases.)

1. The Senators and Representatives shall receive a compensation for their services, to be ascertained by law, and paid out of the Treasury of the United States. They shall in all cases, except treason, felony, and breach of the peace, be privileged from arrest during their attendance at the session of their respective Houses, and in going to and returning from the same; and for any speech or debate in either House they shall not be questioned in any other place.

2. No Senator or Representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States which shall have been created, or the emoluments whereof shall have been increased during such time; and no person holding any office under the United States shall be a member of either House during his continuance in office.

SECTION 7. (House to originate all revenue bills. Veto. Bill may be passed by two-thirds of each House, notwithstanding, etc. Bill, not returned in ten days, to become a law. Provisions as to orders, concurrent resolutions, etc.)

1. All bills for raising revenue shall originate in the House of Representatives, but the Senate may propose or concur with amendments, as on other bills.

2. Every bill which shall have passed the House of Representatives and the Senate shall, before it becomes a law, be presented to the President of the United States; if he approve, he shall sign it, but if not, he shall return it, with his objections, to that House in which it shall have originated, who shall enter the objections at large on their journal, and proceed to reconsider it. If after such reconsideration two-thirds of that House shall agree to pass the bill, it shall be sent, together with the objections, to the other House by which it shall likewise be reconsidered; and if approved by two-thirds of that House it shall become a law. But in all such cases the votes of both Houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the journal of each House respectively. If any bill shall not be returned by the President within ten days (Sundays excepted) after it shall have been presented to him, the same shall be a law in like manner as if he had signed it, unless the Congress by their adjournment prevent its return; in which case it shall not be a law.

3. Every order, resolution, or vote to which the concurrence of the Senate and House of Representatives may be necessary (except on a question of adjournment) shall be presented to the President of the United States; and before the same shall take effect shall be approved by him, or being disapproved by him, shall be repassed by two-thirds of the Senate and House of Representatives, according to the rules and limitations prescribed in the case of a bill.

SECTION 8. (Powers of Congress.) The Congress shall have power:

1. To lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defence and general welfare of the United States; but all duties, imposts and excises shall be uniform throughout the United States.

2. To borrow money on the credit of the United States.

3. To regulate commerce with foreign nations, and among the several States, and with the Indian tribes.

4. To establish an uniform rule of naturalization and uniform laws on the subject of bankruptcies throughout the United States.

5. To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures.

6. To provide for the punishment of counterfeiting the securities and current coin of the United States.

7. To establish post offices and post roads.

8. To promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries.

9. To constitute tribunals inferior to the Supreme Court.

10. To define and punish piracies and felonies committed on the high seas, and offences against the law of nations.

11. To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water.

12. To raise and support armies, but no appropriation of money to that use shall be for a longer term than two years.

13. To provide and maintain a navy.

14. To make rules for the government and regulation of the land and naval forces.

15. To provide for calling forth the militia to execute the laws of the Union, suppress insurrections and repel invasions.

16. To provide for organizing, arming and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the States respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress.

17. To exercise exclusive legislation in all cases whatsoever over such district (not exceeding ten miles square) as may, by cession of particular States and the acceptance of Congress, become the seat of the Government of the United States, and to exercise like authority over all places purchased by the consent of the Legislature of the State in which the same shall be, for the erection of forts, magazines, arsenals, dockyards, and other needful buildings.

18. To make all laws which shall be necessary and proper for carrying into execution the foregoing powers and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof.

SECTION 9. (Provision as to migration or importation of certain persons. Habeas corpus. Bills of attainder, etc. Taxes, how apportioned. No export duty. No commercial preference. Money, how drawn from treasury, etc. No titular nobility. Officers not to receive presents, etc.)

1. The migration or importation of such persons as any of the States now existing shall think proper to admit shall not be prohibited by the Congress prior to the year one thousand eight hundred and eight, but a tax or duty may be imposed on such importation, not exceeding ten dollars for each person.

2. The privilege of the writ of habeas corpus shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it.

3. No bill of attainder or ex post facto law shall be passed.

4. No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration herein before directed to be taken.

5. No tax or duty shall be laid on articles exported from any State.

6. No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another, nor shall vessels bound to or from one State be obliged to enter, clear, or pay duties in another.

7. No money shall be drawn from the

Treasury but in consequence of appropriations made by law; and a regular statement and account of the receipts and expenditures of all public money shall be published from time to time.

8. No title of nobility shall be granted by the United States. And no person holding any office of profit or trust under them shall, without the consent of the Congress, accept of any present, emolument, office, or title of any kind whatever from any king, prince or foreign state.

SECTION 10. (States prohibited from the exercise of certain powers.)

1. No State shall enter into any treaty, alliance, or confederation, grant letters of marque and reprisal, coin money, emit bills of credit, make anything but gold and silver coin a tender in payment of debts, pass any bill of attainder, ex post facto law, or law impairing the obligation of contracts, or grant any title of nobility.

2. No State shall, without the consent of the Congress, lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws, and the net produce of all duties and imposts, laid by any State on imports or exports, shall be for the use of the Treasury of the United States; and all such laws shall be subject to the revision and control of the Congress.

3. No State shall, without the consent of Congress, lay any duty of tonnage, keep troops or ships of war in time of peace, enter into any agreement or compact with another State, or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay.

ARTICLE II.

SECTION 1. (President; his term of office. Electors of President; number and how appointed. Electors to vote on same day. Qualification of President. On whom his duties devolve in case of his removal, death, etc. President's compensation. His oath of office.)

1. The Executive power shall be vested in a President of the United States of America. He shall hold his office during the term of four years, and, together with the Vice President, chosen for the same term, be elected as follows:

2. Each State shall appoint, in such manner as the Legislature thereof may direct, a number of electors equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress; but no Senator or Representative or person holding an office of trust or profit under the United States shall be appointed an elector.

3. The electors shall meet in their respective States and vote by ballot for two persons, of whom one at least shall not be an inhabitant of the same State with themselves. And they shall make a list of all the persons voted for, and of the number of votes for each, which list they shall sign and certify and transmit, sealed, to the seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted. The person having the greatest number of votes shall be the President, if such number be a majority of the whole number of electors appointed, and if there be more than one who have such a majority, and have an equal number of votes, then the House of Representatives shall immediately choose by ballot one of them for President; and if no person have a majority, then from the five highest on the list the said House shall in like manner choose the President. But in choosing the President, the vote shall be taken by States, the representation from each State having one vote. A quorum, for this purpose, shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. In every case, after the choice of the President, the person having the greatest number of votes of the electors shall be the Vice President. But if there should remain two or more who have equal vote, the Senate shall choose from them by ballot the Vice President.*

4. The Congress may determine the time of choosing the electors and the day on which they shall give their votes, which day shall be the same throughout the United States.

5. No person except a natural born citizen, or a citizen of the United States at the time of the adoption of this Constitution, shall be eligible to the office of President; neither shall any person be eligible to that office who shall not have attained to the age of thirty-five years and been fourteen years a resident within the United States.

6. In case of the removal of the President from office, or of his death, resignation or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice President, and the Congress may by law provide for the case of removal, death, resignation or inability, both of the President and Vice President, declaring what officer shall then act as President and such officer shall act accordingly until the disability be removed or a President shall be elected.

7. The President shall, at stated times, receive for his services a compensation which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States, or any of them.

8. Before he enter on the execution of his office he shall take the following oath or affirmation:

"I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States, and will, to the best of my ability, preserve, protect and defend the Constitution of the United States."

SECTION 2. (President to be Commander-in-Chief. He may require opinions of Cabinet officers, etc.; may pardon. Treaty-making power. Nomination of certain officers. When President may fill vacancies.)

1. The President shall be Commander-in-Chief of the Army and Navy of the United States, and of the militia of the several States when called into the actual service of the United States; he may require the opinion, in writing, of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices, and he shall have power to grant reprieves and pardons for offences against the United States except in cases of impeachment.

2. He shall have power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur; and he shall nominate and by and with the advice and consent of the Senate shall appoint ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States whose appointments are not herein otherwise provided for, and which shall be established by law; but the Congress may by law vest the appointment of such inferior officers as they think proper in the President alone, in the courts of law, or in the heads of departments.

3. The President shall have power to fill up all vacancies that may happen during the recess of the Senate by granting commissions, which shall expire at the end of their next session.

SECTION 3. (President shall communicate to Congress. He may convene and adjourn Congress, in case of disagreement, etc. Shall receive ambassadors, execute laws and commission officers.) He shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient; he may, on extraordinary occasions, convene both Houses, or either of them, and in case of disagreement between them with respect to the time of adjournment, he may adjourn them to such time as he shall think proper; he shall receive ambassadors and other public ministers; he shall take care that the laws be faithfully executed, and shall commission all the officers of the United States.

SECTION 4. (All civil offices forfeited for certain crimes.) The President, Vice President and all civil officers of the United States shall be removed from office on impeachment for and conviction of treason, bribery or other high crimes and misdemeanors.

ARTICLE III.

SECTION 1. (Judicial powers. Tenure. Compensations.) The judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish. The judges, both of the Supreme and inferior courts, shall hold their offices during good behavior, and shall at stated times receive for their services a compensation which shall not be diminished during their continuance in office.

SECTION 2. (Judicial power; to what cases it extends. Original jurisdiction of Supreme Court. Appellate. Trial by jury, etc. Trial, where.)

1. The judicial power shall extend to all cases in law and equity arising under this Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority; to all cases affecting ambassadors, other public ministers and consuls; to all cases of admiralty and mari-

*This paragraph in force only from 1788 to 1803; superseded by Article XII, Amendments.

time jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more States, between a State* and citizens of another State, between citizens of different States, between citizens of the same State claiming lands under grants of different States, and between a State; or the citizens thereof, and foreign states, citizens or subjects.

2. In all cases affecting ambassadors, other public ministers, and consuls, and those in which a State shall be party, the Supreme Court shall have original jurisdiction. In all the other cases before mentioned the Supreme Court shall have appellate jurisdiction both as to law and fact, with such exceptions and under such regulations as the Congress shall make.

3. The trial of all crimes, except in cases of impeachment, shall be by jury, and such trial shall be held in the State where the said crimes shall have been committed; but when not committed within any State the trial shall be at such place or places as the Congress may by law have directed.

SECTION 3. (Treason defined. Proof of. Punishment of.)

1. Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court.

2. The Congress shall have power to declare the punishment of treason, but no attainder of treason shall work corruption of blood or forfeiture except during the life of the person attained.

ARTICLE IV.

SECTION 1. (Each State to give credit to the public acts, etc., of every other State.) Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof.

SECTION 2. (Privileges of citizens of each State. Fugitives from justice to be delivered up. Persons held to service having escaped, to be delivered up.)

1. The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States.

2. A person charged in any State with treason, felony, or other crime, who shall flee from justice, and be found in another State, shall, on demand of the Executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime.

3. No person held to service or labor in one State, under the laws thereof, escaping into another shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due.

SECTION 3. (Admission of new States. Power of Congress over territory and other property.)

1. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the jurisdiction of any other State, nor any State be formed by the junction of two or more States, or parts of States, without the consent of the Legislatures of the States concerned, as well as of the Congress.

2. The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States; and nothing in this Constitution shall be so construed as to prejudice any claims of the United States, or of any particular State.

SECTION 4. (Republican form of government guaranteed. Each State to be protected.) The United States shall guarantee to every State in this Union a Republican form of government, and shall protect each of them against invasion, and, on application of the Legislature, or of the Executive (when the Legislature cannot be convened), against domestic violence.

ARTICLE V.

(Constitution; how amended. Proviso.) The Congress, whenever two-thirds of both Houses shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the Legislatures of two-thirds of the several States, shall call a convention for proposing amendments, which in either case, shall be valid to all intents and purposes, as part of this constitution, when ratified by the Legislatures of three-fourths of the several States, or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided that no amendment which may be made prior to the year one thousand eight hundred and eight shall in any manner affect the first and fourth clauses in the Ninth Section of the First Article; and that no State, without its consent, shall be deprived of its equal suffrage in the State.

ARTICLE VI.

(Certain debts, etc., declared valid. Supremacy of Constitution, treaties and laws of the United States. Oath to support Constitution, by whom taken. No religious test.)

1. All debts contracted and engagements entered into before the adoption of this Constitution shall be as valid against the United States under this Constitution as under the Confederation.

2. This Constitution and the laws of the United States which shall be made in pursuance thereof and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land, and the judges in every State shall be bound thereby, anything in the Constitution or laws of any State to the contrary notwithstanding.

3. The Senators and Representatives before mentioned, and the members of the several State Legislatures, and all executive and judicial officers, both of the United States and of the several States, shall be bound by oath or affirmation to support this Constitution; but no religious test shall ever be required as a qualification to any office or public trust under the United States.

ARTICLE VII.

(What ratification shall establish Constitution.) The ratification of the Conventions of nine States shall be sufficient for the establishment of this Constitution between the States so ratifying the same.

Done in convention by the unanimous consent of the states present the seventeenth day of September in the year of our Lord one thousand seven hundred and eighty-seven and of the independence of the United States of America, the twelfth. In witness whereof we have hereunto subscribed our names.

Attest: William Jackson, Secretary; George Washington, President and deputy from Virginia; New Hampshire—John Langdon, Nicholas Gilman; Massachusetts—Nathaniel Gorham, Rufus King; Connecticut—William Samuel Johnson, Roger Sherman; New York—Alexander Hamilton; New Jersey—William Livingston, David Brearley, William Paterson, Jonathan Dayton; Pennsylvania—B. Franklin, Thomas Mifflin, Robert Morris, George Clymer, Thomas Fitzsimons, Jared Ingersoll, James Wilson, Gouverneur Morris; Delaware—George Read; Gunning Bedford, Jr., John Dickinson, Richard Bassett, Jacob Broom; Maryland—James McHenry, Dan of St. Thomas Jenifer, Daniel Carroll; Virginia—John Blair, James Madison, Jr.; North Carolina—William Blount, Richard Dobbs Spaight, Hugh Williamson; South Carolina—J. Rutledge, Charles Cotesworth Pinckney, Charles Pinckney, Pierce Butler; Georgia—William Few, Abraham Baldwin.

The Constitution was ratified by the thirteen original States in the following order: Delaware, December 7, 1787, unanimously; Pennsylvania, December 12, 1787, vote 46 to 23; New Jersey, December 18, 1787, unanimously; Georgia, January 2, 1788, unanimously; Connecticut, January 9, 1788, vote 128 to 40; Massachusetts, February 6, 1788, vote 187 to 168; Maryland, April 28, 1788, vote 63 to 12; South Carolina, May 23, 1788, vote 149 to 73; New Hampshire, June 21, 1788, vote 57 to 46; Virginia, June 25, 1788, vote 89 to 79; New York, July 26, 1788, vote 30 to 28; North Carolina, November 21, 1789, vote 193 to 75; Rhode Island, May 29, 1790, vote 34 to 32.

Twelve amendments to the Constitution were proposed at the First Session of Congress, begun and held at the City of New York, on Wednesday, March 4, 1789. The first two were not adopted. The following ten were adopted by the necessary number of States and now stand as the first ten amendments to the Constitution. The original proposal of these amendments were preceded by the following preamble and resolution:

THE conventions of a number of the States having, at the time of their adopting the Constitution, expressed a desire, in order to prevent misconstruction or abuse of its powers, that further declaratory and restrictive clauses should be added, and as extending the ground of public confidence in the Government will best insure the beneficent ends of its institution.

Resolved, By the Senate and House of Representatives of the United States of America, in Congress assembled, two-thirds of both Houses concurring, that the following articles be proposed to the Legislatures of the several States, as amendments to the Constitution of the United States; all or any of which articles, when ratified by three-fourths of the said Legislatures, to be valid to all intents and purposes, as part of the said Constitution, namely:

*See Article XI, Amendments

The following ten original amendments were declared in force December 15, 1791.

ARTICLE I.

Religious Establishment Prohibited. Freedom of Speech, of the Press, and Right to Petition. Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble and to petition the Government for a redress of grievances.

ARTICLE II.

Right to Keep and Bear Arms. A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed.

ARTICLE III.

No Soldier to Be Quartered in Any House, Unless, etc.) No soldier shall, in time of peace, be quartered in any house without the consent of the owner, nor in time of war but in a manner to be prescribed by law.

ARTICLE IV.

Right of Search and Seizure Regulated. The right of the people to be secure in their persons, houses, papers and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ARTICLE V.

Provisions Concerning Prosecution, Trial and Punishment—Private Property Not to Be Taken for Public Use, Without Compensation. No person shall be held to answer for a capital or otherwise infamous crime unless on a presentment or indictment of a Grand Jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war or public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.

ARTICLE VI.

Right to Speedy Trial, Witnesses, etc. In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which districts shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense.

ARTICLE VII.

Right of Trial By Jury. In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law.

ARTICLE VIII.

Excessive Bail or Fines and Cruel Punishments Prohibited. Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

ARTICLE IX.

Rule of Construction of Constitution. The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people.

ARTICLE X.

Rights of States Under Constitution. The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

The following amendment was proposed to the Legislatures of the several States by the Third Congress on the 5th of March, 1794, and was declared to have been ratified in a message from the President to Congress, dated January 8, 1798.

ARTICLE XI.

Judicial Powers Construed. The Judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States, by citizens of another State, or by citizens or subjects of any foreign state.

The following amendment, in lieu of the third paragraph of the first section of the second article of the Constitution, was proposed to the Legislatures of the several States by the Eighth Congress on the 12th of December, 1803, and was declared to have been ratified in a proclamation by the Secretary of State, dated September 25, 1804. It was ratified by all the States except Connecticut, Delaware, Massachusetts and New Hampshire.

ARTICLE XII.

Manner of Choosing President and Vice President. The Electors shall meet in their respective States, and vote by ballot for President and Vice President, one of whom at least shall not be an inhabitant of the same State with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice President; and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice President, and of the number of votes for each, which list they shall sign and certify, and transmit, sealed, to the seat of the Government of the United States, directed to the President of the Senate; the President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted; the person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of Electors appointed; and if no person have such majority, then from the persons having the highest numbers, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice President shall act as President, as in the case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice President shall be the Vice President if such number be a majority of the whole number of Electors appointed, and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice President; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice President of the United States.

The following amendment was proposed to the Legislatures of the several States by the Thirty-eighth Congress on the 1st of February, 1865, and was declared to have been ratified in a proclamation by the Secretary of State dated December 18, 1865. It was rejected by Delaware and Kentucky; was conditionally ratified by Alabama and Mississippi; and Texas took no action.

ARTICLE XIII.

Slavery Abolished.

SECTION 1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convincted, shall exist within the United States, or any place subject to their jurisdiction.

SECTION 2. Congress shall have power to enforce this article by appropriate legislation.

The following, popularly known as the Reconstruction Amendment, was proposed to the Legislatures of the several States by the Thirty-ninth Congress on the 16th of June, 1866, and was declared to have been ratified in a proclamation by the Secretary of State dated July 28, 1868. The amendment received the support of twenty-three Northern States; it was rejected by Delaware, Kentucky, Maryland, and ten Southern States. California took no action. Subsequently it was ratified by the ten Southern States.

ARTICLE XIV.

Citizenship Rights Not to Be Abridged.

SECTION 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

Apportionment of Representatives in Congress.

SECTION 2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of Electors for President and Vice President of the United States, Representatives in Congress, the executive and judicial officers of a State, or the members of the Legislature thereof, is denied to any of the male inhabitants of such State, being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

Power of Congress to Remove Disabilities of United States Officials for Rebellion.

SECTION 3. No person shall be a Senator or Representative in Congress, or Elector of President and Vice President or hold any office, civil or military, under the United States, or under any State, who having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any State Legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid and comfort to the enemies thereof. But Congress may, by a vote of two-thirds of each House, remove such disability.

What Public Debts are Valid.

SECTION 4. The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations and claims shall be held illegal and void.

SECTION 5. The Congress shall have power to enforce by appropriate legislation the provisions of this article.

The following amendment was proposed to the Legislatures of the several States by the Fortieth Congress on the 27th of February, 1869, and was declared to have been ratified in a proclamation by the Secretary of State, dated March 30, 1870. It was not acted on by Tennessee; it was rejected by California, Delaware, Kentucky, Maryland and Oregon; ratified by the remaining thirty States. New York rescinded its ratification January 5, 1870. New Jersey rejected it in 1870, but ratified it in 1871.

ARTICLE XV.

Equal Rights for White and Colored Citizens.

SECTION 1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude.

SECTION 2. The Congress shall have power to enforce this article by appropriate legislation.

The following amendment was proposed to the Legislatures of the several States, by the Sixty-first Congress on the 12th day of July, 1909, and was declared to have been ratified in a proclamation by the Secretary of State, dated February 25, 1913. The income tax amendment was ratified by all the States except Connecticut, Florida, Pennsylvania, Rhode Island, Utah and Virginia.

ARTICLE XVI.

Income Taxes Authorized. The Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration.

The following amendment was proposed to the Legislatures of the several States by the Sixty-second Congress on the 16th day of May, 1912, and was declared to have been ratified in a proclamation by the Secretary of State, dated May 31, 1913. It received the vote of all the States except Alabama, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Rhode Island, South Carolina, Utah and Virginia.

ARTICLE XVII.

United States Senators to Be Elected By Direct Popular Vote.

SECTION 1. The Senate of the United States shall be composed of two Senators from each State, elected by the people thereof, for six years; and each Senator shall have one vote. The electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislatures.

Vacancies in Senatorships, When Governor May Fill by Appointment.

SECTION 2. When vacancies happen in the representation of any state in the Senate, the Executive authority of such State shall issue writs of election to fill such vacancies: Provided, That the Legislature of any State may empower the Executive thereof to make temporary appointment until the people fill the vacancies by election as the Legislature may direct.

SECTION 3. This amendment shall not be so construed as to affect the election or term of any Senator chosen before it becomes valid as part of the Constitution.

The following amendment was proposed to the Legislatures of the several States by the Sixty-fifth Congress, December 18, 1917; and on January 29, 1919, the Acting Secretary of State proclaimed its adoption by 36 States, and declared it in effect on January 16, 1920.

Early in 1920, the validity of the Eighteenth Amendment was upheld by the Supreme Court of the United States, in suits to void, brought by the States of Rhode Island and New Jersey, and by various brewers and distillers.

ARTICLE XVIII.

Liquor Prohibition Amendment.

SECTION 1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.

SECTION 2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.

SECTION 3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the Legislatures of the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress.

The following amendment was proposed to the Legislatures of the several States by the Sixty-fifth Congress, having been adopted by the House of Representatives, May 21, 1919, and by the Senate, June 4, 1919. On August 26, 1920, the Secretary of State proclaimed it in effect, having been adopted (June 10, 1919-August 18, 1920), by three-quarters of the States. The Tennessee House, August 31, rescinded its ratification, 47 to 24.

ARTICLE XIX.

Giving Nation Wide Suffrage to Women.

SECTION 1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex.

SECTION 2. Congress shall have power to enforce this article by appropriate legislation.

ARTICLE XX.

Terms of president and vice-president to begin on Jan. 20; those of Senators and Representatives, on Jan. 3.

The following amendment was proposed to the Legislatures of the several States by the Seventy-second Congress, in March, 1932, a joint resolution to that effect having been adopted, first by the House, and then, on March 2, by the Senate. On Feb. 6, 1933, the Secretary of State proclaimed it in effect, 39 of the 48 States having ratified. By Oct. 15, 1933, it had been ratified by all of the 48 States.

SECTION 1. The terms of the President and Vice-President shall end at noon on the 20th day of January, and the terms of Senators and Representatives at noon on the 3rd day of January, of the years in which such terms would have ended if this article had not been ratified; and the terms of their successors shall then begin.

SECTION 2. The Congress shall assemble at least once in every year, and such meeting shall begin at noon on the 3rd day of January, unless they shall by law appoint a different day.

SECTION 3. If, at the time fixed for the beginning of the term of the President, the President elect shall have died, the Vice-President elect shall become President. If a President shall not have been chosen before the time fixed for the beginning of his term, or if the President elect shall have failed to qualify, then the Vice-President elect shall act as President until a President shall have qualified; and the Congress may by law provide for the case wherein neither a President elect nor a Vice-President elect shall have qualified, declaring who shall then act as President, or the manner in which one who is to act shall be selected, and such person shall act accordingly until a President or Vice-President shall have qualified.

SECTION 4. The Congress may by law provide for the case of the death of any of the persons from whom the House of Representatives may choose a President whenever the right of choice shall have devolved upon them, and for the case of the death of any of the persons from whom the Senate may choose a Vice-President whenever the right of choice shall have devolved upon them.

SECTION 5. Sections 1 and 2 shall take effect on the 15th day of October following the ratification of this article (Oct., 1933).

SECTION 6. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the several States within seven years from the date of its submission.

ARTICLE XXI.

Repeal of the Eighteenth (Prohibition) Amendment by Conventions in the States.

The following proposed amendment to the Constitution, embodied in a joint resolution of the 72nd Congress (Senate, Feb. 16, 1933, by 63 to 23; House, Feb. 20, 1933, by 289 to 121), was transmitted to the Secretary of State on Feb. 21 and he at once sent to the governors of the States copies of the resolution. The amendment went into effect on Dec. 5, 1933, having been adopted by 36 of the 48 States—three-quarters of the entire number. The amendment is:

SECTION 1. The eighteenth article of amendment to the Constitution of the United States is hereby repealed.

SECTION 2. The transportation or importation into any State, Territory, or Possession of the United States for delivery or use therein of intoxicating liquors, in violation of the laws thereof, is hereby prohibited.

SECTION 3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by conventions in the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress.

Up to Sept. 12, the Repealer Amendment had been ratified by all of the States except Georgia, Kansas, Louisiana, Mississippi, Nebraska, North Carolina (rejected); North Dakota, Oklahoma, South Carolina (rejected); and South Dakota—38 States for repeal; 2 against; 8 having taken no action, although Nebraska and South Dakota were scheduled to elect, on Nov. 6, 1934, delegates to conventions, to vote on the question of repeal. Of the 38 States that voted for repeal, 37 acted in 1933, and Montana voted on Aug. 6, 1934.

The internal revenue taxes reaped by the United States Government in consequence of the adoption of the Repealer Amendment have been as follows, in year ended June 30, 1934—on distilled spirits and wines, $89,951,747; on fermented malt liquors, $168,959,585.

The various States also derived large sums from liquor licenses and other forms of tax. In New York state, from Dec. 5, 1933, to July 31, 1934, the receipts exceeded $10,500,000, from 12,000 licenses.

FINE ARTS

THE two simplest divisions that man can make of what he sees about him are nature and art. A thing is either natural or artificial; either God made it or man made it. The things that man can make are usually either useful or beautiful; or they are a combination of beauty and utility, as in architecture. The beautiful arts are called the "fine arts," and are usually listed as architecture, painting, sculpture, music and poetry; of these the most nearly related—the sister arts—are architecture, painting and sculpture.

Just what the meaning of art is has caused philosophers to ponder through the ages, and to fill volumes with their speculations. It used to be thought that art was the premeditated creation of the beautiful; but many things, especially some modern paintings, are not beautiful in the sense that we have heretofore understood beauty. But unquestionably they are art. So a more modern definition is that art is the expression of an emotion. Art is surely an evidence of the divine in man. It is something that distinguishes him from all the rest of creation. It is a message that the artist receives from his Creator, and it is his duty and joy to pass it on to humanity. This is the reason why the artist has always been revered.

There are other fine arts—some more, some less fine—such as dancing, the drama, oratory and the opera; and there are those industries where the arts of painting, sculpture or architecture are closely intermingled, as ceramics, leaded and stained glass, jewelry, weaving, cabinet making, and many others.

The general terms that divide art into chronological or historical divisions are unfortunately very loose and uncertain. Usually they are listed: Prehistoric, Ancient, Medieval, Renaissance and Modern.

Prehistoric Art. It is only during the last fifty years that we have discovered that a truly great and noble pictorial art existed among our ancestors 50,000 years ago. The Cromagnon men, who lived in caves in Europe in the Paleolithic, or Old Stone Age, left drawings and carvings of animals long since extinct which compare very favorably with the work of the early Greeks. This work we call prehistoric art, and so also can be classified the work of any race produced before the dawn of its recorded history; such was the art of the lake dwellers of Switzerland and of the mound builders and cliff dwellers of America.

Ancient Art. About 5000 B.C. the Egyptians built the first of their tombs and invented the system of picture-writing, or hieroglyphics. This makes a convenient date for the beginning of ancient art. The course of ancient art continues through the lives of the ancient inhabitants of Chaldea, Babylonia, Assyria, Persia, Phoenicia, Crete, Greece (where in the sixth and fifth centuries B.C. it reached its greatest glory) and Rome. The art of Greece and Rome is termed "classic," and on it alone is based all the subsequent art of Europe and our art of today. In the fall of Rome and the Western Empire in 426 A.D., ancient art may be considered to have ended.

A Smiling Angel

Angel of the thirteenth century in Reims Cathedral, France. This beautiful conception by an unknown sculptor is an important contribution to art.

Medieval Art. Medieval is the name given to the period of a thousand years that followed the fall of Rome. This span of time we call the "Dark Ages" and the "Middle Ages" in western Europe and in the Eastern Empire in Byzantium, now called Constantinople. The Middle Ages has to do politically with the beginnings of modern western nations out of the wreck of the ancient Roman Empire, and socially with the gradual civilizing of the northern barbarian hordes which had overthrown Rome. Its most important phenomenon was the rise and increasing power of Christianity as exemplified in the Roman Catholic Church, with its head, the Pope, in Rome. Throughout the Middle Ages the Pope ruled with temporal and spiritual powers often greater than those of any king or emperor. This was also the romantic period of chivalry and of the feudal system, of King Arthur and his Round Table, of knights and ladies, of castles and dungeons. During the Middle Ages occurred the Crusades, the romantic and long-drawn-out struggle of the Christian nations to recover the Holy Land from the Moslems. Christianity triumphed over Mohammedanism in the struggle for the possession of Europe. England was won by William the Conqueror. Fearful plagues, decimating the populace, swept time and again across the land. While the Middle Ages often descended to the depths in ignorance, poverty, cruelty and wretchedness, at the same time it was a period glorified by the highest examples of chivalry, ecstatic faith and courage.

The art of the first half of the Middle Ages was termed Romanesque in western Europe, and Byzantine in the Near East. They are contemporary, and have many things in common. The second half is glorified by the art which in painting, sculpture and architecture we call the Gothic. Its greatest expression and achievement was the cathedral, which marked the culmination of the art of the Middle Ages.

The Renaissance. Renaissance means "re-birth" and refers to a re-birth of classic ideals—the ideals of Greece and Rome. The Renaissance is used, in a strict sense, to cover the period from 1420 to 1500; and, in a broad sense, it includes the entire period up to the present time. In architecture and sculpture, Europe, beginning with Italy in the early fifteenth century, began to use again the ancient forms and methods of Greece and Rome. In learning, there was a corresponding interest in Greek and Roman literature. This intellectual activity spread to science and exploration. Perspective was discovered, and a new beauty of the human body, both of which gave birth to modern painting. Printing, gunpowder, the telescope, the circulation of the blood, the Copernican theory of the universe, the discovery of America—all are early Renaissance gifts, where "Man discovers himself and the world."

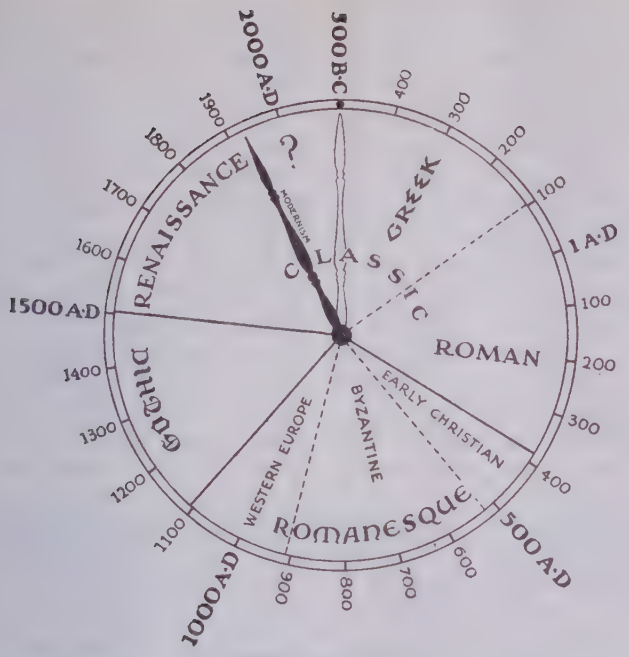
The early years of the Renaissance were concerned with spreading the new arts over Europe, and with wars determining the boundaries of European nations; the later years, generally speaking, were concerned with the development of science and industry. The outstanding event of the Renaissance was the discovery and rise of America. The

Renaissance witnessed the Reformation, the French Revolution, the Independence of America and, in its later phases, it beheld the discovery of the steam engine, anesthetics, the telegraph, the telephone, the incandescent light, the radio, the automobile, the airplane. This interesting era also saw the displacement of a love of the fine arts in the minds of people by a greater interest in science and the useful arts. In the opinion of many, the period of the Renaissance in its broadest sense came to an end in the World War.

Modernism. We are so close to modern events that it is difficult properly to appraise their significance. There is no doubt that vital changes, social and artistic, were accomplished by the World War; and the world we live in today is a very different one from that of 1913. In fact, there are many reasons for believing that we are seeing the birth of a new era in culture and art—an era that future historians will classify as following the Renaissance and, perhaps, as being as different from it as the Renaissance was different from the Middle Ages. We are so close to the scene that it is difficult for us to realize in its proper perspective what is going on about us.

Divisions of the Fine Arts. Architecture has often been called the "mother of the arts"; and certainly, in her sheltering arms, painting and sculpture have been nourished and protected. It is architecture, therefore, that best shows in its development the chronology of art described above, but all of the arts to a greater or less degree keep step with architecture in their march through the centuries.

Sculpture, the eldest, is ever present. In ancient Egypt, every building was adorned with carving or attended with statues in the round. In Greece, in the age of Pericles, sculpture reached a height which in perfection of craftsmanship, beauty of form and nobility of conception it has never surpassed and which, in significance, it has never since attained. In the Middle Ages sculpture shared, side by side, the fortunes of architecture: they begged by the roadside in the Dark Ages, but were the hosts of popes and kings in the portals of magnificent cathedrals of the thirteenth century. At no other period were their fortunes so closely interwoven. From the time of the Renaissance, sculpture has strayed farther and farther from the mother fold of architecture; but there are indications that after four hundred years of brilliant and often wayward independence she, for her own salvation, will return to her ancient protector. The possibilities of free-standing sculpture sometimes seem almost exhausted, yet there are tremendous opportunities opening up for the sculptural adornment of the mighty creations of modern architecture.



If we go back to the adornment of the Pleistocene caves, the art of the Cromagnons —a combination of painting and engraving— appears to antedate architecture, although obviously anything in the nature of a structure could not have survived the enormous stretch of the centuries. We know much of the pictorial and painted art of the Egyptians. We know that it was bound with the chains of priestly tradition and law, and in consequence it seldom rose above the level of a decoration. Of Greek painting we know little, but it seems to have been a neglected Cinderella sitting at the fireside of architecture and sculpture. In medieval times, painting appeared in new forms garbed in the gorgeous beauty of stained and leaded glass, in the somber dignity of Byzantine mosaics, and in the countless varieties of the art of the weaver and the illuminator. Painting and its sister arts, drawing and engraving of various kinds, did not come to full flower until the Renaissance. First, in late medieval times, came the fresco and altar-piece; and in the fifteenth century, appeared the art of perspective, painting in oils, development of the easel picture and engraving of various kinds. Painting was no longer the handmaid of architecture and of the Church; it became the independent and splendid consort of a new era. The painting of the Renaissance is certainly comparable to the sculpture of Greece in the Periclean Age. The graphic arts, which include painting, are, with the possible exception of music, the most popular and widely distributed of all arts. Besides the various forms of painting in oils on canvas, such as murals, portraits, still life and landscapes, there are water-colors, wash-drawings, line-drawings of many kinds, etching, aquatints and dry-points, mezzotints, steel and copper plate engraving, woodcuts and wood-blocks, lithography, and the many commercial and mechanical forms of reproduction, such as halftones, zinc etchings and color reproduction. Interior decoration and the design of furniture is, and always has been, more closely allied to architecture than has any other art. So true is this that characteristic ornament often occurs simultaneously in furniture and architecture. Such features as choir stalls, if movable, would be regarded as furniture; connected to the structure they become a part of the architecture, and the same is true of other decoration. The fine arts, in graphic form, have never been with us and about us more than they are today. If science and the machine have crowded them out of the position closest to our hearts, they are nevertheless as indispensable to a happy and healthy life as they ever were. It is our duty, and should be our joy, to know them and love them.

Court of Honor, World's Columbian Exposition

A jewel in a setting of grandeur was the Court of Honor at the Columbian Exposition in Chicago in 1893. The colossal fountain in the foreground by MacMonnies, one of the greatest of American sculptors, was one of the outstanding beauty spots of the exposition.

ARCHITECTURE

Architectural Clock

This diagram shows the lapse of time in terms of architectural style from 500 B.C., when our architecture began, through nearly twenty-five hundred years to the present time. Note the large space on the dial, nearly two-thirds of the whole, in which Classic influence prevailed.

THE art of building beautifully is architecture. Sheds and silos are not architecture unless some effort is made to make them beautiful. Architecture, from the dawn of history, has constantly so touched and mingled with human life in the home, the shop and the temple that often it is the best history and commentary we have of the life of its creators. On account of its universality and its ancient origin, it is often called "the mother of the arts." Today, next to agriculture, architecture employs more people directly and indirectly than does any other occupation. It is the most useful of the fine arts, and the noblest of the useful arts.

Construction. There are three elemental types of construction that alone, or in combination, control the form of all architecture. They are: first, the lintel, in which openings are spanned by a flat slab or beam supported at each end by uprights; second, the arch, where the opening is covered by a number of pieces of masonry arranged usually in a curved form (the vault and the dome are forms of the arch); third, the truss, where pieces of wood or metal are joined together in triangular formation and supported at each end. The modern invention of reinforced concrete, whereby concrete is immensely strengthened by embedded steel bars, is often regarded as a fourth.

The lintel form was used exclusively by the Egyptians and the Greeks. The Romans added the arch, and used both. In the sixteenth century the truss was invented, and this made possible the roofing of great areas. Today, with reinforced concrete we have the advantage of using all these methods.

Style. The architecture of different countries and of different periods in the same country vary in marked degree in appearance. These differences, which may be fundamental but are usually superficial, are classified into styles. They are much like family likenesses. All of the architectural styles of Europe and America, except aboriginal styles such as the splendid Mayan of Yucatan in Mexico, are derived through ancient Rome from Greece. In the broadest sense they may be grouped in three great divisions: Classic, Romanesque and Gothic.

Egyptian Architecture. Egypt is extraordinary and marvelous in many ways. The earliest Greek architecture dates from about 650 B.C., but in Egypt, on account of its climate and its isolated position, there are buildings in excellent preservation that were built four or five thousand years ago. Notwithstanding the vastness and sublimity of Egyptian architecture, it had almost no effect on the architecture of Greece, and has none at all on ours. In that sense it is a dead art, whereas Greek art is still a vital thing and an inspiration to every architect today.

The Egyptian buildings that have come down to us are tombs and temples. The temples were probably palaces as well. They employed exclusively the lintel type of construction. The buildings were built of stone or granite, usually of huge size, and the walls were covered with word pictures, or hieroglyphics, and with figures of men and gods, which were usually colored. The great pyramids built, perhaps, about 3500 B.C., are the most impressive of the tombs. There were other rock-cut tombs, such as that of Tutenkhamon, which have given us not only the mummified bodies of the royal occupants themselves, but their furniture, jewelry, toys and even food. Besides the tombs there were obelisks, sphinxes and great figures of the kings, who were regarded as gods. The temple-palaces were equally extraordinary—that of Karnak being a vast assemblage of pylons, colonnades and the hypostyle hall, covering in all an extent of 1,215 feet in length by 376 feet in width. The great columns are seventy feet in height and twelve feet in diameter. Other great temples are at Edfou, Luxor, Denderoh and Philae.

Egyptian art lasted until about 300 A.D.,

Temple of Ammon, Karnak

Built about 2200 B.C. Although our architecture owes no debt to ancient Egypt we view such magnificent remains of an ancient civilization with admiration and astonishment.

long after the conquest by Rome, and maintained its character to the last.

Chaldea. Recent excavations at Ur, the ancient Biblical capital of Chaldea and the birthplace of Abraham, indicate that the art and culture of Chaldea are as ancient as those of Egypt. The Chaldeans were greatly handicapped by having little, other than mud, to build with; but they did the best they could. They made the mud into bricks and with these they built low buildings with

The Parthenon (in ruins)

Built about 447 B.C. on the Acropolis in Athens, the masterpiece of Greek Classic architecture and generally regarded as the building nearest approaching architectural perfection. It is in the Doric style.

immensely thick walls on the top of stupendous terraces of brick and clay. Decorative effects they secured by applying glazed colored tiles and carved slabs of precious alabaster to the face of the walls. Not having stone or even wood of large sizes, their rooms, as we should expect, are very narrow; possibly some were vaulted, as the Chaldeans seem to have understood the use of the arch. No evidence of windows has been discovered, and these strange hall-like rooms reflected from their tiled walls only the flickering light of lamps and the daylight that entered the single door. Many houses today, in the same locality, dispense with windows as a protection against the terrific heat. The principal remains of Chaldean art and architecture are found at Ur, Birs-Nimroud and Nippur. Babylon became the capital of Chaldea about 1900 B.C. Of its vast hanging gardens, which in ancient times were one of the Seven Wonders of the World, and of its proud magnificence, only shapeless mounds of clay are left.

Assyria. To the north of Chaldea, in the valley of the Euphrates, was its fierce rival, Assyria. The Assyrians possessed stone and wood in limited quantities, and understood well the arch and vault. Nevertheless, they copied the uncomfortable plans of the Chaldeans, and their ornament seems to have been derived equally from Chaldea and Egypt. Very strangely, they seem never to have made use of the column. The remains of architecture in Assyria are extensive owing to their use of stone, and are to be found at the great Palace of Sargon at Khorsabad, Nineveh and Nimroud.

Persia. From 536 to 525 B.C. the Persians, under Cyrus the Great and Cambyses, became masters of ancient Assyria, and Chaldea, and Egypt as well. At Persepolis and Susa they built great palaces from the remains of which we can form excellent conceptions. The Persians continued the building traditions of Assyria and Chaldea in the use of glazed brick and tile on terraces and thick walls; but they added the use of the column, thereby attaining vast rooms in which slender columns of stone, of a curious design, supported timber roofs. The arts which they borrowed from the conquered countries were, in a sense, the cause of their downfall; for, sunk in the softness of oriental luxury, they were unable to protect themselves against the attacks of youthful Alexander and his Greek phalanxes, and the great Persian empire fell in 331 B.C.

Syria. Of Jewish and Syrian architecture our knowledge comes almost solely from the Bible, which contains a detailed description of the Temple built by Solomon. Added to and rebuilt by different rulers it presented, during the life of Christ, an extraordinary combination of Egyptian, Assyrian and Roman elements, and must have been one of the most magnificent buildings of its day. The great contribution of the Hebrews to civilization is in the realms of religion, literature and law, not in art.

Greek Classic Architecture. As we have said before, our architecture owes little or nothing to the great civilizations that preceded or existed side by side with that of Greece. Their architecture more properly lies in the realms of archaeology. The great stream of art that now covers Europe and the two Americas began as a tiny rivulet in the rocky peninsulas and islands anciently called Hellas, but glowing in the minds of all of us as Greece.

The mind of the Greek was sharply distinguished from that of the Egyptian, the Assyrian or the Hebrew. Joined to a love of nature, of whose attributes he created deities, was a highly intellectual, analytical and symmetrical mind. The Greek lived close to the sea (a circumstance which made him a trader and traveler), and in a land rich in structural, if not in agricultural, resources. The Egyptian had granite; the Assyrian, clay; the Greek, marble. The beginnings of Greek art, "intimations of immortality," are original, vivid and human. The art of Egypt was frozen; that of Assyria, monstrous. So at Knossos in Crete, and in Mycenae on the mainland, we find remains that, for all their antiquity, are strangely modern.

However, it is with the invention of the orders, about 700 B.C., that Greek architecture takes a definite form. The type of construction adopted by the Greeks was exclusively of the lintel form; the arch and vault, if not unknown, were at least never used. The lintels were upheld by posts or columns. These columns, together with the lintel which they supported, were of three distinct varieties, called "orders." The first had sturdy columns from five to seven diameters in height, without any base, and with a cap of great simplicity and beauty composed of a square block (abacus) above a curved molding (echinus). The lintel, more properly in this case called the entablature, was composed of three members, the architrave, frieze and cornice, each arranged in a characteristic fashion. This is the Doric order, and supposedly was invented by a vigorous northern tribe of Greeks called Dorians. The Ionian Greeks gave us the second order, called, in their honor, the Ionic. The curious and beautiful capital, with its delicate spirals (volutes), is its characteristic feature. The entablature is divided into three parts, but is differently ornamented from the Doric. The columns have bases as well as caps, and are more widely spaced. The Doric, even by the ancients, was likened in its vigor to the masculine form; and the Ionic, in its grace, represented the feminine. The third order is the Corinthian, little used among the Greeks, and the last in origin. It is the same as the Ionic except for the cap. This is an inverted bell in form, richly decorated with acanthus leaves arranged below four small protruding volutes. The shafts of all these columns were lined vertically with delicate grooves (flutes); and temples, particularly in the Doric style, were highly colored. These orders, while usually

The Colosseum

One of the greatest monuments of the Roman Classic styles; completed in 82 A.D. Its great arena furnished amusement for its many thousands of spectators.

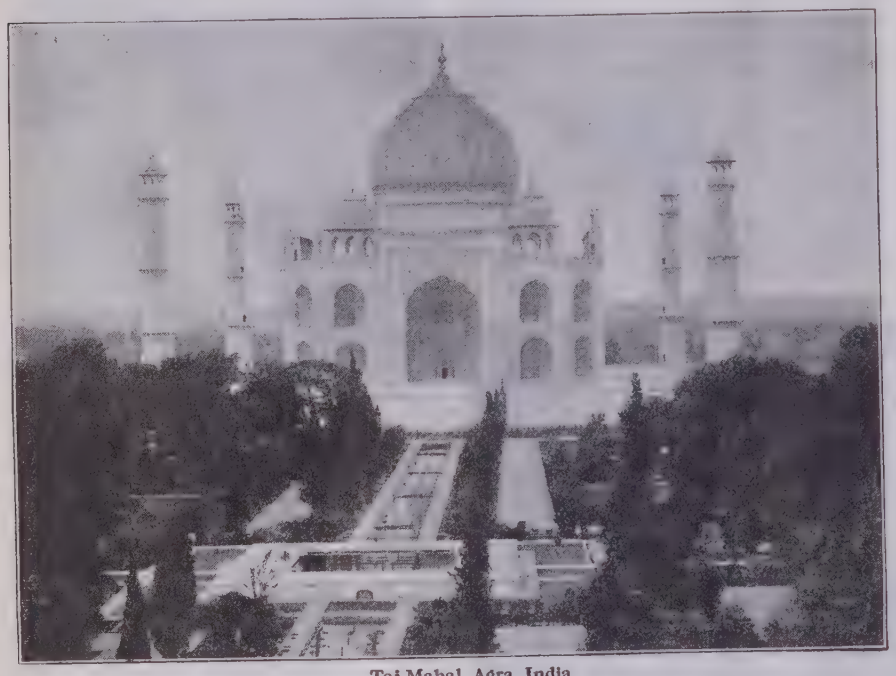
used exclusively in a building, were sometimes mixed.

The Greek solved his problem perfectly, but we must admit it was very simple. Buildings that have come down to us were chiefly of two kinds, temples and theaters. The temples were composed of a rectangular room, to which in various ways was attached a colonnaded portico often embellished with sculpture. The theaters were usually semicircular, uncovered, and occupied a natural depression in a hill. The noblest period of Greek architecture is the age of Pericles, 460 to 410 B.C. To it belong the three gems of Greek architecture—the Parthenon, the Erectheon and the Propylaeum. Greek architecture became more florid in the age of Alexander the Great, 300 to 100 B.C., but lasted through the Roman domination, from about 100 B.C. to 200 A.D.

Roman Classic Architecture. The five or six hundred years in which the Western World was under Roman domination, from about 100 B.C. to the fall of Rome, form one of the great cultural eras of mankind. This era was fitly expressed by a characteristic architecture. The Roman was ambitious, hard-headed, a great organizer and builder. He was not the artist or the individualist that the Greek was. His architecture is based on the three Greek orders, which he altered and elaborated. His favorite was the Corinthian, which became the principal vehicle for the "grandeur that was Rome." In construction, the Roman made great and original contributions. He developed the arch, the vault and the dome from the primitive arched construction of the Etruscans, and these he united with the column and lintel of the Greeks. He used concrete for vaults and walls, facing it with stone and marble. Where the Greeks had but one or two types of building, the Roman had a dozen, and these often on an enormous scale. Temples, basilicas, theaters, amphitheaters, circuses, triumphal arches, vast baths, palaces and houses in their ruins attest the might and engineering skill of the Romans. In every Roman city, from Italy to Britain, was a forum or civic center adorned with statues, colonnades and monumental buildings. The greatest of these that have come down to us are the Pantheon, the Baths of Diocletian and of Caracalla, the Colosseum, the Forum and many arches—all in Rome; the Maison Carrée in France; ruined temples in Timgad, Africa; Palmyra and Baalbec in Syria; and, perhaps most interesting of all, the entire city of Pompeii, at the foot of Mount Vesuvius, in Italy. In 79 A.D. this Roman suburban city was entirely engulfed by mud and ashes from the volcano, and has thereby been preserved through the ages. The excavated houses and other buildings show us, in minute detail, the daily life and surroundings of a Roman citizen in the century in which Christ lived. The great pagan Roman empire became Christian by an edict of Constantine in 313 A.D., and hardly more than 100 years later, in one of the most extraordinary cataclysms in history, it fell before the onrush of vast hordes and tribes of northern barbarians. Civilization was almost snuffed out, and a period of a thousand years ensued, called the "Dark Ages," in which a new culture slowly emerged from the ruins of the mighty Roman Empire.

Sancta Sophia (interior)
In Constantinople, ancient Byzantium. One of the great masterpieces of architecture; built 532-7 A.D.; earliest and best example of the eastern form of the Romanesque known as Byzantine. The ugly disks are Turkish additions.

Romanesque Architecture. The architecture and art of Europe between 500 and 1100 A.D. is called the "Romanesque," which of course means "like Roman" or "derived from Roman." While it was derived from Roman art, it soon developed characteristics that made it very distinct. There was very little building after the fall of the Empire. Temples and villas lay empty and forlorn. The artists and artisans had been killed or dispersed, and their knowledge had died with them. The small amount of construction was done with fragments of imperial buildings. The only thing the Romans had not built in profusion was churches. The early Christians refused to use pagan temples, but had no objection to using the law courts, or basilicas. These were low, oblong buildings, usually divided by two parallel rows of columns into a central space, or nave, with an aisle on either side. At the end opposite the entrance was a bay, or apse, that held the judge's seat. The Christians replaced the seat with an altar, and the basilica made an excellent church. Our own churches today can be traced back, step by step, to the basilica. The great Christian basilicas of St. Paul, St. John Lateran and many others in Rome have come down to us. Romanesque art is almost entirely concerned in the building of churches and monasteries. Columns soon took a secondary place, and Romanesque buildings are usually attempts, often crude, to use the arch in decorative forms and some kind of vault or dome to cover the aisles and nave. Heavy walls, deep shadows, recessed doors and windows, with rough and barbaric carvings of animals and men, often gave the buildings a fierce and gloomy aspect.



St. Trophîme
The entrance portal of the church of St. Trophîme at Arles, France, built in the twelfth century. This is an excellent example of the Romanesque style of western Europe. Witness the round recessed arches and the rude ornament.

In the East, at Constantinople (or Byzantium, as it was called), the Romanesque appeared in a startlingly different form—the

Notre Dame Cathedral
In Paris. One of the masterpieces of the Gothic style.

Byzantine. It appeared suddenly, fully developed, in one magnificent building—Sancta Sophia, built by the Emperor Justinian, 532–7 A.D. This is one of the most precious buildings in the world; perhaps it ranks next to the Parthenon in importance and, except for certain Mohammedan disfigurements, exists in its pristine splendor. In it a great structural device appears for the first time; Justinian's architects, Anthemius and Isodorus, supported the great dome on the top of four mighty arches, filling in the space between the arches with four spherical triangles (pendentives). This became the method used thereafter, in the building of domes, as it made possible the roofing of a square plan by a dome. The Byzantine dependence on color by the use of inlays of marble and mosaic for their decorative scheme became the basis of all Mohammedan and Near-Eastern art, and the exquisite arabesques and inlays of the Alhambra, built by the Moors in Spain, are all offspring of Sancta Sophia.

Taj Mahal, Agra, India

Although said to have been designed by a European is nevertheless regarded as the pearl of Indian architecture. The perfect setting and superb workmanship are important factors in its beauty.

The principal monuments of the Romanesque elsewhere in Europe are: in Italy, Saint Mark's in Venice, showing strong Byzantine influence, and the Leaning Tower, Cathedral and Baptistery in Pisa; in France, many vaulted churches which vary in their constructional scheme according to their locality; in England, all the Norman churches and cathedrals, such as those at Durham and at Canterbury; along the Rhine, a number of fine brick churches of which the Cathedral of Mayence is a good example; and in Spain, many churches (such as that at Salamanca), often altered into the succeeding Gothic.

The Gothic Style. The fifth century B.C. in Greece, and the thirteenth century A.D. in France, are usually regarded as marking the highest peaks to which architecture, as a fine art, has attained. Perhaps future historians will place our present epoch beside them. In the thirteenth century in France and in other European countries were built the great cathedrals which have immortalized the Middle Ages. Their style is called "Gothic"—not a very appropriate name, but one too firmly entrenched to be uprooted.

Romanesque architecture rather suddenly developed into Gothic through the invention of three architectural devices. The first was the ribbed vault; the second, the flying buttress; the third, the pointed arch. All three made it possible to build naves of great height (Beauvais is 165 feet in the clear); but it is the pointed arch which gives the style its characteristic appearance, because this form was uniformly used in ornamental as well as in structural features.

Whereas the Romanesque found its limited opportunity in the abbey church, the monastery and the fortress, the Gothic found a broader and more magnificent field in the great cathedral and in secular buildings of various kinds, such as town halls, palaces and college buildings. The Gothic style owed much to its sister arts, sculpture, stained glass, and even painting. Every cathedral with its piers, buttresses and towers leading heavenward, its niches filled with statues of saints and kings, its great windows glowing with the fires of stained and leaded glass, its altars hung with rare fabrics and painted with scenes from the Scriptures, became a symphony of beauty and exaltation. No wonder they thrill us today! The Gothic style can usually be dated by its window tracery, which became, in its development, more complicated and ornate.

The monuments of the Gothic style are far too numerous to list. Some of the great cathedrals are: in France—Chartres, Amiens, Rheims, Paris; In England—Salisbury, Westminster Abbey, York, Canterbury; in Germany—Cologne, Strassburg, Freiburg; in Belgium—Antwerp; in Spain—Seville, Burgos, Toledo; in Italy—Florence, Orvieto, Siena, Milan. Other examples of Gothic occur in Belgium's town halls and Italy's civic buildings.

The Classic Renaissance. The meaning of the Renaissance has already been suggested, and its architectural peculiarity—the abandonment of medieval forms and the return to the classic—(the architecture of Greece and Rome) has been pointed out. Architecturally, the Renaissance began in 1420 when Brunelleschi, the architect, used classic forms in the addition of the great dome to the Cathedral of Florence. Classic art became the fashion; Gothic was looked upon with contempt. We know the names of very few ancient or medieval architects. With the Renaissance they became important personalities. Alberti, Bramante, Peruzzi, Raphael, Michelangelo, Palladio, Vignola—all followed the example of Brunelleschi, and developed the application of Classic art to modern problems.

About 1500 the Renaissance, partly through French conquest, but mostly through fashion, spread to France. Here it became associated with the reigns of brilliant kings, each of whom developed it in some characteristic fashion, and gave his name to the period,

St. Peter's, Rome

The largest church in Christendom is the greatest monument of the Renaissance. It was built during the sixteenth century by a number of architects, the greatest of whom was Michelangelo.

such as Francis I, Henry II, Henry IV, Louis XIV, Louis XV, Louis XVI, The Empire (Napoleon).

The English work in its early stages was less sophisticated and much cruder than her models. Here the periods are named from the reigning families or rulers, such as Tudor, Elizabethan, Jacobean, Georgian. England has given us perhaps the best known of all architects, Sir Christopher Wren, the builder of Saint Paul's Cathedral.

Germany, through the influence of its great artist, Albrecht Dürer, adopted the Renaissance. Here it developed in a manner somewhat similar to that of England. Spain produced in the Plateresque and Churrigueresque styles the most fantastic variations of Classic motives that are to be found.

The American colonies, before our government was founded, were active participants in the Renaissance. Our beautiful Colonial is an importation of the English Georgian, tastefully adapted to our needs and materials.

The only thing which the Renaissance held in common with the Gothic was its dependence on the sister arts. Renaissance buildings, particularly in Italy, were embellished with the most beautiful painting and sculpture. The art of the landscape architect was a new development; and great palaces, such as those at Versailles in France, owe much of their effect to the gardens, fountains and trees. Though the architects of this period borrowed the orders and most of their constructional features from ancient Rome, and their dome construction from Sancta Sophia, yet they used great ingenuity and a high degree of skill to conform these to the complexities of modern life. They also, in the invention of the true truss, added a great structural principle to architecture. The amount of building in the Renaissance vastly exceeded that of all the preceding periods, and almost all of it exists today. Only the briefest summary can be made here.

Italy. This land, which had so woefully lagged behind in the Gothic period, inaugurated and predominantly led in the Renaissance. The Pitti and Strozzi Palaces in Florence; the library of Saint Mark in Venice; palaces and churches almost without number in such cities as Sienna, Milan, Vicenza, Genoa; and especially the Farnese Palace, the Vatican, and the greatest church in Christendom—Saint Peter's in Rome, culminated one of the most brilliant architectural epochs in history.

In France we find the chateaux of the pleasure-loving monarchs, such as Blois and Fontainebleau; great churches, like the Invalides and St. Sulpice in Paris; and the magnificent palaces of Versailles and the Louvre.

England gives us many manor houses, the palace of Whitehall by Inigo Jones, and the famous churches and Saint Paul's Cathedral, all from the mighty hand of Sir Christopher Wren.

In Germany the buildings were fewer, comprising town halls of picturesque design and the ruined castle of Heidelberg.

The architecture of Spain varies between the greatest exuberance, as at Salamanca, to the utter frigidity of the Escorial, the palace and tomb of Philip II.

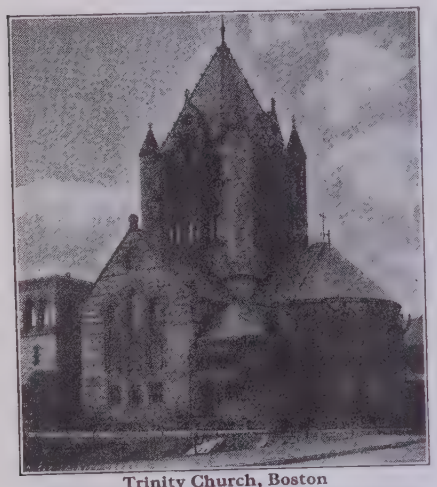
Town halls and churches were built in lesser degree in Holland, Belgium and Scandinavia.

Later Architecture in Europe. About 1800 the Greek buildings of the Acropolis in Athens became, for the first time, widely known. This gave rise to an architectural fashion known as the Greek Revival. Its best monuments in England are Saint George's Hall, Liverpool, and the British Museum. Germany gives us its art museums and the Brandenburg Gate; France, much more original, the beautiful Madeleine and the magnificent Arc de Triomphe. Towards the middle of the century there was a Gothic revival in England that produced the houses of Parliament; and in France, a rich form of Classicism under Napoleon III that has given us the gorgeous Opera House in Paris. At the close of the century Italy produced the ostentatious Victor Emmanuel Monument. Our own century has seen the birth of secessionism, or "modern art," in Europe. Most original and interesting work has been done in Germany and the north countries, especially the railroad station at Helsingfors, Finland, and the city hall in Stockholm. At the present day, modernism, which is a departure from classic examples, is growing apace; and in the direction particularly of construction and of planning, America is exerting an increasing influence in Europe.

Mount Vernon

The home of Washington is a beautiful example of our Colonial, sometimes called Georgian, architecture. It was built about the time of the Revolutionary War and stands on the banks of the Potomac near Alexandria, Virginia.

Mohammedan Architecture. From the eighth century A.D. onward for a thousand years, a characteristic and often magnificent type of architecture was practiced at varying times in the great stretch of territory from Spain on the west along the southern shores of the Mediterranean to northern India on the east. The style is based on the Byzantine. Structurally, it depends on the dome and vault; decoratively, on the elaborate geometrical surface ornament and on color (rather than on light and shade), for effect. Its buildings are principally mosques, palaces, tombs and city gates. Its great centers are in the Moorish cities of Spain where the Alhambra, the Mosque of Cordova and the Giralda Tower furnish magnificent examples; in the Arabic city of Cairo, with its many mosques, of which the mosques of Omar and of Sultan Hassan are characteristic; in Constantinople, where the Turks have built the great Mosque of Suleiman; in Persia, with its tomb at Sultaniyeh; and finest and noblest of all, the buildings of the great Mogul Empire in northern India. The Taj Mahal at Agra, the gem of the style, was built as a tomb by Shah Jehan about 1650. In beauty of material, proportion, workmanship and setting it is hardly surpassed by any building in the world.



Oriental Architecture. The Hindu and Buddhist styles of India and the architecture of China and Japan are so remote, and their contact with our arts so slight, that a description of them must be very brief. Indian architecture dates as far back as 279 B.C. It has various manifestations, and the buildings are either domical shrines to Buddha (called "topes"), rockcut temples, or monasteries. Use was made of both domes and columns, and surfaces were elaborately carved with ornament and allegorical figures. Horizontal emphasis predominates. Monuments are scattered over the whole land, but predominate in the South.

Chinese and Japanese Architecture. The architecture of China and Japan has been chiefly of wood and perishable material, and is oriental in general appearance. With the exception of tower-like pagodas, the temples are low and insignificant, and are usually aggregations of small buildings. It is remarkable that the splendid sense of beauty in decoration in both these races has not led to a noble architecture. Perhaps this is responsible for the fact that European architecture is supplanting the native styles.

Architecture in the United States. Architecture in the United States used to be summarized in, and dismissed with, a paragraph or two. The extraordinary development and expansion of building in the last thirty-five years has, however, raised America to world supremacy, and its architectural development has become a thrilling story that all should know.

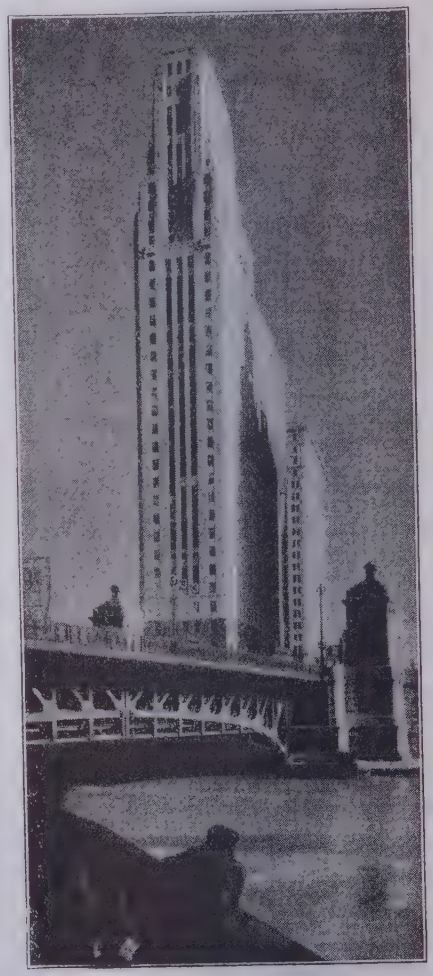
Colonial Style (1630-1800). Our colonists and the citizens of our infant republic looked to England for their models in

building; so the early American houses built before 1700 were small, crude, very simple, and without architectural detail, very like houses of the reign of Elizabeth in England. Such is the Capen house, Toppsfield, Massachusetts, or the Paul Revere house in Boston. About 1730, safety, prosperity and regular intercourse with England were established, and with them the architectural style of the mother country was imported. This is the

Trinity Church, Boston

Georgian, a form of the Renaissance which makes great use of the orders and classic detail. The orders, with excellent taste, were altered in proportion to fit American material, which was for the most part good white pine. For the greater part of the century the style was vigorous and robust—the influence, doubtless, of Sir Christopher Wren. After the Revolution the style became delicate and attenuated, following the mode dictated in London by the Adam brothers, famous architects and designers. Buildings were limited to houses, churches and a few town halls. Good examples exist in Mount Vernon, the home of Washington; Old South Church, Boston; St. Michaels, Charleston; and Independence Hall, Philadelphia.

Post Colonial (*1790-1820*). Thomas Jefferson, on his return from France, where he had been the American minister for four years, turned our eyes from England to France. Jefferson built three important buildings—Monticello, his home; the capitol at Richmond, and the University of Virginia. Professional architects began to appear, such as Charles Bulfinch. The old City Hall in New York City was built in the French manner. At Washington the Capitol was under construction, and the White House was built.



Greek Revival (*1820-1850*). We have mentioned the Greek Revival in Europe. It was introduced into America by a famous architect, Benjamin Latrobe, and, curiously enough, it flourished among our pioneers. The Greek style was used for every kind of building from the Atlantic Ocean to the Great Salt Lake and throughout the Southern States. Arlington, Virginia, the home of Robert E. Lee, is a fine example; perhaps the best is Girard College, Philadelphia.

Parvenu (*1850-1880*). Our attitude toward architecture was decidedly provincial in the years immediately preceding and following the Civil War. These years mark the low ebb of taste in America. We attempted to borrow the architectural fashions of the hour from England, and, at the same time, from France. The first exists in many examples of a debased form of Gothic made popular in England by John Ruskin; and the second, by the fashionable and elaborate Classic style, popular in Paris under Napoleon III. Look about you for houses with cupolas and mansard roofs. They all belong to this period. Good examples exist in Memorial Hall, Harvard University and in the Philadelphia City Hall. The Centennial Exposition, Philadelphia, 1876, marked the high point of the Parvenu era.

Romanesque Revival (*1880-1893.*) H. H. Richardson, a famous architect, built Trinity Church, Boston, in 1877. It caused a sudden and extraordinary vogue for building in the Romanesque style, second only in popularity to the rage for Greek art of fifty years before. During this era, about 1886, the skeleton steel frame for skyscrapers was invented, of which the first completed example, now torn down, was the Tacoma Building in Chicago.

Eclecticism, 1893, to the World War. The World's Fair in Chicago, 1893, of which Daniel H. Burnham was architect-in-chief, overthrew the Romanesque revival almost overnight, and reintroduced the Classic style in its various forms. McKim, Mead and White in the Boston Public Library became leaders in taste, while Ralph Adams Cram and Bertram Goodhue revived the Gothic. Many professional architects appeared after the Fair, and all styles were practiced with skill. More or less standardized types of buildings were developed, such as railroad stations, banks, Y.M.C.A. buildings and high schools. Great examples are the Pennsylvania Station, New York; the Union Station, Washington, D. C.; St. Thomas's Church, New York; the New York Public Library; Harkness Memorial, New Haven. Beautiful villas were built in Newport, in Santa Barbara and in Lake Forest, Illinois. Throughout the country, architects struggled with the problem of the skyscraper, and although they developed it mechanically, they failed to find its true form of artistic expression. Some of the great skyscrapers of the period are the Times Building and Woolworth Tower, New York City. Louis Sullivan, a courageous and brilliant architect of Chicago, in his Transportation Building at the World's Fair, suggested an original kind of design which attracted many young men who hoped from it to develop a purely "American style." Sullivan's dictum was that form must express function. The best-known disciple of Sullivan is Frank Lloyd Wright. His Midway Gardens, Chicago, was an excellent example. The Eclectic period is by all odds our most prolific one, and reflects the vast wealth and power of our country as developed in the last thirty-five years.

Modernism. Vast changes have occurred in the culture and art of the world since, and perhaps on account of, the World War. In architecture this is made evident by the use of new forms in ornament, and by a vast improvement in the designs of the skyscraper which is, after all, America's greatest contribution to architecture. The second prize design in the Tribune Tower competition by Eliel Saarinen, in which he eliminated all cornices, had a great deal to do with this; so did the New York building laws, which enforced "step-offs" and thereby gave buildings a terrace-like effect. All great skyscrapers are now built according to the new inspirations. Famous examples are the Telephone, the Chrysler and the Empire buildings in New York City, the Palmolive, the Daily News, the Civic Opera buildings in Chicago and the Telephone Building in St. Louis. The Merchandise Mart in Chicago and the new State House in Lincoln, Nebraska, are important examples of the modern style. The Caddo Parish Court House in Shreveport, Louisiana represents well the modernized Classic. The Bok Singing Tower in Florida is in the Gothic tradition treated with modern freedom.

The Skyscraper

The 333 North Michigan Avenue Building, Chicago, is typical of the new era of the American skyscraper. In the whole history of the world no nation has approached America in the extent and cost of its architectural productions.

You who have read this article are living in a wonderful age. You are seeing greater things being created in architecture than the world has ever seen before. You are witnessing perhaps the birth of a new era. It is a glorious opportunity. Know it, and be a part of it!

SCULPTURE

SCULPTURE, in the strict sense of the term, refers only to works carved or cut by hand in some solid substance; but it is extended to include all plastic forms, cast, molded, hammered, carved or engraved—everything, in fact, where a surface is changed by man's intervention directly or indirectly.

The Materials of Sculpture. Almost every imaginable material has been used, the most popular being gold, silver, bronze, ivory, marble and other stones, clay, enamel, wax and plaster. Sometimes several materials are combined. In the chryselephantine (from the Greek words meaning "gold" and "ivory") sculpture of the Greeks, some parts of the surface of a statue were of gold and others of ivory. In many medieval and Renaissance wood carvings the surface was entirely concealed by a thin coating of plaster which, in turn, was colored; silver was often gilded, and stone and terra cotta were coated with stucco.

Polychromy. We are so accustomed to a colorless sculpture in stone that we forget how large a part was played in the past by polychromy, or the art of giving a colored surface to sculpture. This was particularly the practice among the Babylonians, Egyptians, Assyrians, Persians and early Greeks. It even survived through the best Greek periods and was also used by Etruscan, Roman, Medieval and Renaissance art. Of course most of this color gradually wore off when exposed to the weather, and this makes it difficult for us to understand exactly how a great deal of the sculpture appeared when it came from the sculptor's hand. One method, the glazed and colored terra cottas, was permanent. The lions and other animals and figures built up of enameled tiles in relief, found at Babylon, Susa and Khorsabad, show how familiar this method was to the ancient Orient. The most famous later examples are the terra cottas of the Italian Renaissance, called "Robbia" ware. Many medieval and Renaissance ivories, wood carvings and stuccoes also preserve a rich coloring.

The polychromatic remains of Greek sculpture are naturally much less well preserved, but there is enough to show that brilliant and heavy coloring was used at an early date, especially in architectural sculptures. As soon as marble replaced other stone it was not necessary to stucco and paint the entire surface, and the polychromy was gradually restricted to patterns and borders, to shading the eyes, the hair and other details. The interesting statues of women found on the Acropolis, after being buried there since about 480 B.C., show the most exquisite of the early coloring. The so-called "Sarcophagus of Alexander" in Constantinople is the best preserved example of the latest and most delicate work. We are told that Nikias, a famous painter, was accustomed to color the masterpieces of the Greek sculptor, Praxiteles.

Surface Treatment. There is great variety in the treatment of surfaces, from sculpture in the round, at one end, to intaglio at the other. In the process of intaglio (depressed below the surface), used particularly in precious and semi-precious stones, the design is excavated and often reversed. Sometimes the design is merely scratched or outlined on the surface, as in Greek and Etruscan bronze mirrors and jewel cases. Next comes work in which the background is but slightly lowered (stiacciato), the figures being kept flat with cameo-like unreality, sometimes in connection with figures in higher relief in the same composition.

The Age of Bronze
By Auguste Rodin. One of his first important works and counted by many one of his finest.

In low relief, whether Oriental or Greek, it was the early custom to carve all figures on the same plane. The Romans added the idea of combining figures on different planes in a single composition in which the figures in the foreground are so nearly detached as to be held by only one or two members of the figures behind them, giving practically the effect of statuary.

Statuary and sculpture in the round is where the surface is free standing on all sides, as in statues that stand out on pedestals, to be viewed from any point. But the majority of such works in the past have been made to stand against some background, in a niche, in the gable of a temple, in the portal of a Gothic cathedral and in similar locations; they were often left unfinished in the parts that could not be seen.

The Mission of Sculpture. Sculpture of the human figure has a triple mission: to express plastic beauty of form; to embody thought and feeling, and to act as a chronicler of facts. It was not always able to carry out this triple mission; in fact it did so only during three periods: the Greco-Roman, the Gothic and the early Renaissance. The particular genius of sculpture assigned to it certain limitations. If could not, of course, tell a story with the same detail as painting. On the other hand it could embody—better than could painting—the deeper, broader moods of typical humanity.

At the other extreme is sculpture turned into pictorial channels; this was mainly in relief work, especially when the Romans had, as we have already seen, opened up the way by using a multiplicity of figures in several planes. The Alexandrine reliefs of Greco-Roman art—with their backgrounds of landscape and architecture and the spiral narrative of Trajan's column—lead up to such elaborate compositions as the early Renaissance scenes in Ghiberti's *Gates*.

THE HISTORY OF SCULPTURE

Considering its broad historic lines, we find that sculpture has had a history of nearly 6000 years. For the first 3500 years (from about 4000 B.C. to 500 B.C.) it remained a form of narrative, an embodiment of certain facts or persons. It was instructive, but not intended to convey any pleasure. It had little or no esthetic value. Such was the sculpture of Egypt, Babylonia, Assyria, Persia and other nations of the East.

About 500 B.C. the Greeks began to make of it not only a vehicle of thought and feeling, but an end in itself—a thing of beauty and interest. Sculpture then became in every way an art. The Romans continued this idea, with variations and a gradual loss of beauty, until the final downfall, about 300 A.D.

Sculpture had thus been of esthetic value for about eight centuries. It then lapsed once more into an embodiment of fact; but, more than in its earliest stages, it was used to express thoughts and beliefs, though with infirmity of technical skill. This esthetic eclipse, this dark age, lasted for nine centuries, from about 300 A.D. to 1200.

Then, contemporary with the Gothic impulse in the North, came to Italy a new birth similar to that of Greece, combining in the same way a love of nature and artistic imagination, perfection of technique and a wealth of ideas to be expressed. Sculpture once more was complete and practiced for its own sake. During the Renaissance, imagination gradually gave way to an emphasis of naturalism. Types were displaced by individuals. Post-Renaissance work becomes somewhat artificial and spectacular, leading to the simplicity of the neo-Classic revival as a reaction. But, dissatisfied with its cold artificiality, the leading sculptors of the nineteenth century have in various ways sought the secret of plastic expression mainly through naturalism, simplicity and occasionally by a forceful realism that is inspired as if by the primitive passions of earth.

Egypt. Aside from the crude figures of prehistoric animals outlined on the rocks by cave men, the earliest sculptures are those of Egypt. There is a monotonous uniformity in

Egyptian sculpture during the 4000 years of its history; but a real vitality appears at two periods: at its beginning and again under the Ptolemies. This shows itself especially in portraiture. The heads may be rigid, but they are certainly realistic; this realism was less a matter of art than of religion. It was believed that the soul of the deceased would return at intervals to inhabit the body, and in case anything should have happened to the body, portrait statues were provided with heads so realistic that the soul would be sure to recognize it. Hence the fanatic pains to reproduce every smallest peculiarity and hence, also, the filling of the chamber tombs of Egypt with such statues. With the waning of religious belief came also a decline in this realism. The famous *Seated Scribe* in the Louvre, the *Kneeling Washerwoman* and the *Mayor of the Village* at Cairo, are among the most extraordinary works in this style thus far found.

In royal and divine figures, Egyptian sculpture is sometimes vastly impressive.

An Egyptian Queen

Nefertete, Queen of Egypt and wife of Iknahton, "The Heretic King," (fourteenth century, B.C.). A vivid presentation of refined beauty.

The statue of *King Khufu* of the Great Pyramid, at Cairo, and the colossal rock-cut statues at Ipsambul, are plastic embodiments of the genius of Egypt and rise to the dignity of works of art. They are the exceptions. There is decorative value and delicacy of detail in much Egyptian relief work, especially in the Middle Empire; but the dead hand of traditionalism always checked progress in the study of the figure.

Babylonia, Assyria and Persia. Although sculpture began in Babylonia almost as soon as in Egypt—not long after 4000 B.C.—it never equaled it either in amount or value. The sculptors suffered from lack of adequate material, and the hard diorite, an imported rock, gave an even more disagreeable stiffness to statuary than was the case in Egypt. The statues from Tello in the Louvre are typical.

In Assyria (Babylonia's successor in artistic leadership in western Asia), numerous quarries of soft limestone gave an opportunity to develop relief sculpture and to spread the exploits of the Assyrian kings on the inner palace walls. In this same way the walls of tombs and temples had been covered in Egypt. Although sculpture was still chiefly narrative and still hampered in movement, we must confess to receiving a distinct impression of force from the muscular and energetic Assyrian warriors, and of animal vitality from the hybrid monsters who guard the portal of the palaces. The Assyrians were great sportsmen and hillmen; they therefore knew and studied animal life and could reproduce animals far more faithfully than men. The lions, wild asses, deer and hounds that we see in the royal hunts—wounded, slain or led—are full of character and realism. In fact, in the opinion of some critics, one must go forward 2500 years to the modern work of Barye to find equal understanding of animals in action. One Assyrian reproduction of a wounded lioness, with paralyzed spine, dragging herself along, is famous.

All the other peoples of the Near East practiced sculpture to a certain extent; but among the numerous works of Persian, Hittite and Phoenician artists, nothing emerges of especial interest. Nearly everything is a more or less lifeless imitation of Babylonia and Assyria, or, occasionally, of Egypt.

The Sculpture of Greece. Greek sculpture may be divided into four periods: the archaic style, before 480 B.C.; the grand style of the fifth century; the beautiful style of the fourth century; the dramatic and picturesque style of the Hellenistic Age.

First Period. A few carvings of an ancient Aegean art have been preserved. Recently other interesting remains from the Minoan period have been found in Crete and in the Peloponnesus. The Dorian invasion seems to have wiped out this strange civilization, and it is not until the sixth century B.C. that sculpture reappears. Two distinct racial schools were formed: the Ionic, originating in Asia Minor, and the Doric, with its center in Greece, in the Peloponnesus. We are accustomed to these styles in architecture; they were quite as real in sculpture. The Ionian school developed relief work and the draped female figure, and showed poetry and imagination in types of gods, heroes, legends and myths. The Dorian school studied particularly the nude male figure, and perfected the athletic type. Both schools made an attempt at portraiture and realism in details, a fact which proves considerable power of observation, though as yet there was no sense of life. It was an age of incubation. The most interesting exceptions are those fascinating "priestesses" from the Athenian Acropolis, each a different character study.

The famous statues of the gables of the Temple of Aegina, now at Munich, are the best works of the pure Doric school. The recent discoveries at Delphi have given notable works of both schools to this age: the unique *Bronze Charioteer*, purely Doric, and a series illustrating the development of relief sculpture during the century preceding the Parthenon (550-450 B.C.).

The reaction against the stiffness of the early athletic figures, with arms glued to their sides, already evident at Aegina, is emphasized in the group of the tyrant killers, *Harmodius* and *Aristogiton*, carved by Critius and Nesiotes, of which a copy is in Naples. They are rushing forward vehemently to strike the tyrant Hipparchus. This vehemence is itself eliminated in the works of the greatest predecessor of Phidias, Myron, in which mastery of physical form in action is complete and yet repressed. His two masterpieces, of which copies remain, are the *Discobolus* (disk thrower), bending low for the throw, and the *Marsyas* (a god of nature, resembling Pan), starting back as he sees the flutes of Athena. The *Marsyas* is in the Lateran at Rome. All traces of the archaic have disappeared except in such minor details as the hair. Yet the grand style does not appear, for Myron was a materialist, and great art required the creative imagination of a Phidias. The charming *Girl Runner* in the Vatican shows a similar mastery of the trained female form at this time.

Another preparatory work was the gable sculpture at the Temple of Zeus in Olympia, excavated by the Germans. It represented, at one end of the buildings, a fight between Lapiths and Centaurs, and at the other a chariot race. The grouping and posing are freer than at Aegina; here there is promise of great achievement soon to follow. Apparently the artists, said to be Paeonius and Alcamenes, relied considerably on polychromy and distance. The stately Apollo in the center is still somewhat archaic, while the reclining seer is a realistic portrait. It is archaic art made supple and human before the advent of the Phidian types.

Second Period. The decorations of the Parthenon are the greatest works of sculpture of any age. They are nearly all collected in the British Museum. It is impossible to say whether Phidias himself actually handled any part of them, or whether he did more than merely plan them; but as all his famous masterpieces, such as the colossal statues of *Athena Parthenos* and the *Olympian Zeus*, have disappeared, they are our only clue to his style. The two pediments stand closest to Phidias. One pictured the *Birth of Athena*, the other the *Contest between Athena and Poseidon for Athens*. The most wonderful of the remaining male nude figures are the *Theseus* and the *Cephisus* or *Ilissus*, both reclining. Of the females, the group of the *Three Fates* is perhaps the grandest in existence—grand in its majestic beauty; in the drapery, minute yet broad, free yet clinging; in the full yet supple forms, showing so richly in Ionic softness.

The frieze representing the Panathenaic procession in honor of Athena had an average relief of only one inch and a half, but the extraordinary modeling makes the figures appear to project much farther, and this effect is increased by the skillful overlapping managed through inclining the planes. The most beautiful of the figures in repose is the group of the three gods from the east frieze, still in Athens; but it is difficult to select one slab as more perfect than another among the graceful groups of Athenian horsemen and maidens. They are the embodiment of idealized humanity expressed by an art as subtle in the rendering of personality as in that of form and texture.

There was another great master in the fifth century, Polyclitus. Being Dorian rather than Attic, he naturally excelled in athletic figures. His masterpieces are the *Diadumenos*, a young victor binding the fillet around

his head, and the *Doryphoros*, an athlete with a spear. The latter embodies in his square, massive build the law of proportions for the human body which Polyclitus established as a rule to be followed by all sculptors. The bronze originals are lost; but Roman copies in marble, more or less accurate, remain in various museums. Another noted work was a wounded Amazon, of which the best copy is in Rome (Vatican). Polyclitus' colossal statue of *Hera* (Juno) was as much admired as the *Olympian Zeus* of Phidias; the bust of the *Ludovisi Juno* in Rome and another in Naples have been supposed to reproduce its noble head.

Third Period. Praxiteles, about 350 B.C., introduced a new ideal of grace and beauty, a different feeling for textures and postures, a more humanized and less lofty esthetic ideal. This humanism was heralded by Cephisodotus, in his *Irene and Plutus* (Peace nursing Wealth), preserved at Munich in the marble copy of the bronze original. The most beautiful of Praxiteles' statues was considered by antiquity to be the *Aphrodite of Cnidus*. Of the lost original, the best copy is in the Vatican. It was the most famous of Greek nude Aphrodites: soft and voluptuous, yet broadly developed; shrinking, yet conscious of her beauty. She has the melting, dreamy gaze characteristic of Praxiteles. Almost as famous was the *Satyr*, of which an admirable torso is in the Louvre; but the best copy, as a whole, is in the Capitoline Museum (Rome), where he rests against a tree-trunk with left hand on hip, careless and playful. There are many less artistic replicas. But there remains one original by the hand of Praxiteles himself which, though less famous in antiquity, is far more precious to us because it gives his own handling, which was so great a part of his art. It is the statue of Hermes holding the infant Dionysus, found at Olympia, a masterly combination of strength and tenderness, of structure and finish. The feeling for texture is equally exquisite in flesh, hair and drapery.

Another sculptor, quite as great as Praxiteles, and as dramatic as Praxiteles was self-poised, was Scopas. His is the spirit that heralds the coming age. He took part in the most ambitious sculptural work of the times, the Mausoleum of Halicarnassus, built after 351 B.C. Many superb pieces are in the British Museum, especially the majestic colossal statue of Mausolus himself, and the frieze of the Amazons, which is interesting to compare with fifth century work. It is less crowded, more delicate and lithe. The museums are full of the statues of the schools of Scopas and Praxiteles: gods and goddesses (particularly Eros and Aphrodite), satyrs and fauns, as well as various portrait statues of poets and philosophers. This period was the golden age for well poised, beautiful, calm humanistic types. There was also, however, the dramatic and pathetic side to this art, represented especially by Scopas, and there are copies of one group of statues in particular that render this spirit splendidly: the statues of Niobe and her children being slain by Apollo and Artemis. The best are in Florence. Among the numerous figures, the son of Niobe with upstretched arm and sweeping drapery and Niobe herself protecting her youngest child, are especially appealing. Among single figures the *Meleager* of the Vatican is typical of Scopas and typical, too, of Roman translation.

Latest of the fourth century masters is Lysippus, a prolific and popular artist who headed the Dorian or Sicyonian school. He revived the Polyclitan idea of a canon, or rule of proportion, of the human figure, which he made slenderer and with smaller head. The best copy of his masterpiece, the *Apoxyomenos* or the athlete cleaning himself with a scraper, with its light pose and agile strength, probably embodies his law. *Agias*, a more recent find at Delphi, is believed to come closer to the actual art of Lysippus.

The most beautiful work of the end of this age, and the best preserved work of Greek sculpture, is the *Sarcophagus of Alexander* from Sidon, in Constantinople. Its hunting and battle scenes between Greeks and Persians are even more picturesque than the Amazon frieze of Halicarnassus; and the effect is enhanced by the perfect condition of the surface, on which every detail of the delicate polychromy remains to show us how perfect art can eliminate the hard whiteness of the marble.

Fourth Period. The conquest of Alexander assisted in the spread of Hellenic sculpture throughout the East, and changed its character by creating new centers of artistic production. Athens, and even Greece itself, ceased to lead. The principal schools were at Alexandria, Rhodes, Pergamon and other cities of Asia Minor. Sculpture became more pictorial, dramatic, realistic. Landscape, portraiture, genre, child life, colossal figures and groups, historic scenes and theatrical episodes became the fashion. The placidity and grace of the previous age were lost. Many among the best known Greek originals and copies belong to this period. Conspicuous is the *Apollo Belvedere*, a Roman copy in marble of a bronze Greek original of Apollo as an archer—a graceful figure which became famous at a time when few Greek originals were known. The statue of Apollo's sister, *Artemis* (Louvre), as huntress is a companion to it.

To continue examples of types of the Olympian gods: the famous Otricoli head of *Zeus* (Vatican), popularly thought to represent the Phidian Jupiter, is a splendid conception of this time in a Roman copy. There are two spectacular figures of Hercules, the originals of which are of the school of Lysippus: one is the *Farnese Hercules* (Naples), an exaggerated muscular figure in repose, the other is the much admired *Torso Belvedere* (Vatican). Of the figures of Venus or Aphrodite, the foremost and the only Greek original is the wonderful *Venus de Milo* (Louvre), which rises above the achievements of our age, and is a thing of such serene beauty as to stand on a level with even the sculpture of the Parthenon. The exquisite handling of flesh and drapery, and the grace of the pose, are subordinated to the artist's conception of the goddess as superwoman.

A Greek original dating from the very beginning of this age (about 306 B.C.) is the statue of *Victory* found at Samothrace (Louvre), a nobly exultant work adorned with flying drapery.

The Fates

From the east pediment of the Parthenon. Considered by many the noblest sculptural group in the world. "A most marvelous translation into marble of flesh and of drapery—the highest ideal of womanhood in Greek art."

Pergamum, in Asia Minor, was the seat of the Attalid kings. Its greatness was due to Attalus (241 B.C.), whose victories over the hordes of Gauls were commemorated in a group of bronze statues. The intensely dramatic figure of the *Dying Gaul* (Capitol, Rome) is an early marble copy of one of these masterpieces, and a realistic study of a barbarian hero. Another copy from this series is the Gaul slaying himself and his wife in preference to falling a captive (Terme Museum, Rome). Eumenes, the direct successor of Attalus, built at Pergamum the great *Altar of Zeus*, called "one of the Seven Wonders of the World." It was surrounded by an enormous carved frieze, large parts of which have been excavated and are in the British Museum. The subject is *The Battle of the Gods and Giants*. It is for the Hellenistic age what the Parthenon sculptures are for the fifth century. The two finest sections are those where Zeus, in one case, and Athena, in the other, are engaged in combat. There is an exuberant and massive vigor about the figures, a restlessness and intricacy, a contrast of light and shade, a clashing of lines in the composition that, combined with the size of the figures, make it quite overpowering. The relief is so high that the figures are almost detached and have the effect of gable, rather than of frieze, sculptures. For nearly three centuries this great Pergamene altar influenced art.

This influence is shown in the spectacular group of the *Laocoon*, by Agesander and his

two sons. They were of the Rhodian school, and completed their work about 100 B.C. We see in this struggling and writhing mass an artificial form of the dramatic art of the earlier Pergamenians, in which everything is sacrificed to technical display. It corresponds to the late baroque style of Bernini after Michelangelo. To the same school and date belong the group of the *Farnese Bull* in Naples, representing the punishment of Dirce, fastened to a bull by her stepsons.

Portraiture was also developed. There are a number of characteristic heads of Alexander, conspicuous for his leonine locks, his deep-set eyes and his neck drawn down to one side. In the Naples Museum are many bronze heads from Herculaneum of this age, some supposed to be portraits of the Ptolemies; others are of the famous Greek philosophers and poets. The boy with a goose, in the Louvre, after Boethus, and similar pieces in the Vatican, show the genre work that was so popular in Alexandria.

Louis d' Orleans
By Frémiet, a French sculptor, noted for his equestrian statues. At Pierrefonds, France.

Roman Sculpture. Rome added certain new elements to the heritage of sculpture. These were principally in portraiture, in historic relief, in equestrian statuary and in decorative sculpture. This is indeed a wide field.

Portraiture. In almost any of the large museums one is impressed by some characteristic Roman bust or portrait statue. Ancestor worship and the use of realistic wax figures and painted terra cotta portraits so common in Republican Rome explain why, under the Empire, portraiture in marble and bronze attained to a perfection never equaled before or since. It is a realistic art in which there is enough of idealism to save it from being a mere photograph of nature. This art kept its excellence for nearly three centuries. To compare the seamed and gnarled old man with near-sighted eyes in the marvelous head of the time of Cicero, with the serene countenance of Augustus from his statue in the Vatican, is to see the two sides of this art in its earliest stage. The technique is perfect but unobtrusive. One can gain a clearer idea of Roman character from these heads than from reading Latin literature. Heads of the equally rotund and unintellectual emperors, Vitellius and Vespasian, are amazingly characterized. And, before the art begins to stiffen, these are followed by numerous excellent portraits of Trajan and Hadrian. Even then there are remarkable exceptions, such as the heads of Caracalla, a masterly transcript of unbalanced fury, and vicious return to primitive type. How different all this is from the Greek ideal of concealing the emotions under a serene and perfectly balanced exterior, and of giving to sculpture the form of types instead of the form of individuals!

Many of the portraits belong not to busts but to life-size or colossal statues, in which one may say that Hellenic and Roman peculiarities were combined. The emperors were represented often as gods, and as nude or slightly draped figures of Hellenic type. They were also shown as orators and benefactors, in statues of a kind similar to those of Sophocles or Demosthenes produced by later Greek art. But they also appear as generals in full military panoply, like the Vatican Augustus, and this form is typically Roman. There never was a time in the history of sculpture when so many honorary portrait statues of persons of every sort, men and women, were erected. The squares of every town, the basilicas and porticos, the villas, the baths, the theaters and hippodromes, were all peopled with hundreds of these works. So we may say that the Romans throughout the world, were surfeited with sculpture to an extent unknown even to the Greeks.

Historic Relief Sculpture. The second peculiarly Roman field was historic relief sculpture. This was made possible by the new form given to work in relief. Roman artists revolutionized the art. Their realism seized on sculpture as a medium for expressing national and political life as well as mythological scenes. They attempted at first to do this without radically breaking away from the Greek methods. We see this in the reliefs covering the marble parapet that encircled the famous Altar of Peace. Erected in the Field of Mars at Rome in 12 A.D., its purpose was to celebrate the pacification of the world by Augustus. In contrast with the Hellenic symbolism, which left out the personality of Pericles and the other Greeks whose position corresponds to that of the Romans, we see here the imperial family headed by Augustus on their way to the great commemorative sacrifice.

Out of this graceful semi-Hellenic Augustan style it took a century to develop what was characteristically Roman—forceful, dramatic, picturesque and story-telling. A halfway stage was marked in 81 A.D. by the well-known relief on the Arch of Titus, with its triumphal procession and the carrying of the seven-branched candlestick. It was in 114 A.D., in the reliefs of the Arch of Trajan at Beneventum, that the final stage was reached and perfectly expressed. In them nearly all the principal events on Trajan's reign were represented: his triumph over the Dacians, his Eastern wars, his army reforms, his efforts to restore prosperity by the encouragement of agriculture and commerce. In order to tell these stories effectively the sculptor has adopted the method of placing his figures in three planes, in perspective, one behind the other. The figures in the front plane are sometimes almost detached, being held by an arm so that they have almost the effect of statues; the figures in the background, on the other hand, are almost flat, and sink back. This gave the sculptor the opportunity for the greatest variety of pose and direction, of groupings and composing. There is great play of light and shade, and this helps to give dramatic effect. To us, this may seem almost a commonplace; but until then these had all been unknown factors in sculpture. So carried away were the Romans of this time with the story-telling possibilities of relief-sculpture, that the same men who decorated this arch carved a continuous spiral band that unwinds itself on the column of Trajan in Rome, which tells the entire history of his two Dacian wars. It is in very low relief, and local touches are given by details of architecture and landscape, while originally its effectiveness was increased by brilliant coloring.

Equestrian Statues. Equestrian statues were used by Greek sculptors before the time of Alexander, whose figure on a prancing steed, engaged in battle, was a famous work often copied by Roman artists. The colossal bronze *Marcus Aurelius*, in the square of the Capitol, is the most famous equestrian statue in the world, and served as a model for many artists during the Renaissance and later. It is a powerful work and dramatic in a somewhat heavy style.

Decorative Sculpture. Another interesting innovation was the increased use of decorative sculpture, lavishly employed and fantastically varied. Encouraged by late Hellenistic suggestions, there developed a rank exuberance, a richness of decorative work, a charming mingling of figures and ornament. What could be more exquisite than some of the carved marble vases and altars in the Vatican Museum, or than many of the pilasters that served as models for the fanciful designs of the Italian Renaissance.

Even figures alone were made to serve a decorative purpose, as in the charming stuccoes in the walls of certain tombs on the Via Latina and in the Terme Museum at Rome. The artist would sketch, in the wet stucco on the walls, with a hand admirably sure, little genre scenes that have never been surpassed in delicacy and effectiveness.

During and after the reign of Septimius Severus there came a gradual decline. At the close of the third century, under Diocletian, figure sculpture had become lifeless and almost puppet-like.

Early Christian and Medieval Sculpture. It was the natural result of the decay of Roman society, rather than enmity to sculpture, that eliminated it from the field of art at about the time when Christianity became the religion of the State under Constantine. The friezes of the arch of Constantine—about the only parts of its sculpture that were not robbed from the earlier monuments—and the figures of consuls of this time found in the Roman Forum show that the growing incapacity of sculptors is a sufficient explanation, without bringing in the idea that the Christian church prohibited the art because it so frequently represented the idols of paganism. The decay was general throughout the Roman world, both East and West.

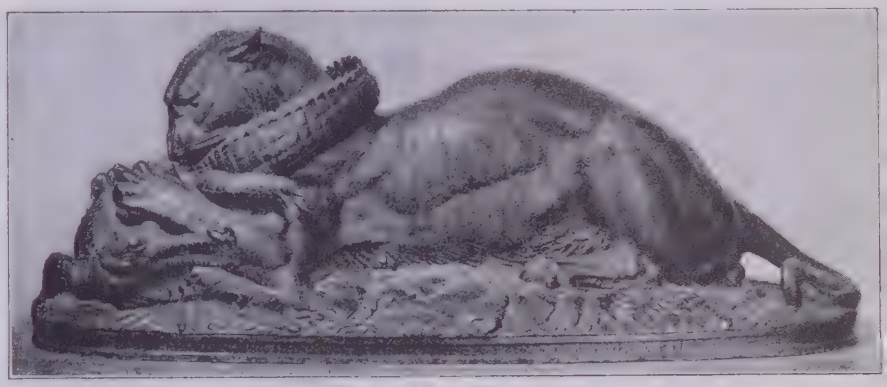
For a short time the Christian tombs were

able, in their reliefs, to tell in a mechanical way the story of Christian belief in the Bible and immortality; but even this phase, which left sculpture without esthetic value and on the same story-telling plane as in the pre-Hellenic days of Egypt and Assyria, came to an end in the fifth century. Painting alone was then used to teach the people the facts of faith and history.

After this, sculpture remained in eclipse for nearly seven hundred years, while the world went through many changes; the crumbling of the Old World, the invasion of the northern races, the rise of Mohammedanism, and the gradual growth of the nationalities and the culture of European peoples under the guidance of the Church. Architecture and painting fluctuated, yet survived; but sculpture did not rise above the level of industrial carving until, in the twelfth century, the later Middle Ages awoke once more to the joys of esthetic beauty, in a manifold and glorious effort to rejuvenate the world.

Gothic Style. It was at the close of the age we call "Romanesque" that sculpture, after having been reduced to decorating book-covers and reliquaries, once more assumed a really monumental rôle, and began an evolution that has no parallel except that of Greece. Even the Greeks and Romans had succeeded less completely in making of the plastic art an integral element, a logical assistant of architecture. This happened when the new art reached its flower in the Gothic style of the thirteenth century. This new union was fundamental, because the Gothic architects were usually sculptors as well, and not only furnished the drawings for a cathedral but carved its portals or its capitals with their own hands. By doing this they went further than either the Greek or Renaissance artists in the way of a practical union of the two arts.

France was not only the birthplace of the Gothic style but established its purest and best forms as well. The new sculpture was used to express the knowledge and the ideas then current throughout Europe. Artists and men of letters were aiding each other in the work. The cathedrals usually were the one place where all the people congregated, not only for worship, but for plays, for fairs, for public and political meetings; the cathedrals were used as the means for instructing the masses. Their walls and portals were carved with figures and relief which systematically summed up all the teaching and the knowledge of the time.



It took more than a half century to achieve this result. The figures set in the old porches of the cathedrals of Chartres and Le Mans have an architectural stiffness similar to an ancient Apollo or Artemis. They are intentionally elongated and straightened in order to give them almost the function of a column or a caryatid. In some faces we see even a reflex of the archaic smile. The artist is at the same pains to reproduce exactly the details of the face and costume of his models. He aims at a portrait rather than a type and, like the Greek sculptor before Phidias, he misses the sentiment of life. This realistic phase was just as necessary with the French as it had been with the Greeks in order to enable the artist, by careful study, to attain to that perfection of technical skill and knowledge of nature that will let him use his art freely. The sculptor is once more a man with a mission as he was in Greece in the fifth century B.C. Each cathedral is a museum of masterpieces, beginning at Notre Dame in Paris and continuing at the cathedrals of Bourges, Chartres, Reims, Amiens and others.

The perfection of early French sculpture is shown in the 530 figures which decorate the west facade of Reims cathedral. We have here a breadth of style, a grand treatment of drapery and a majesty of pose that reminds us of the Parthenon pediments. At the same time there is the greatest variety. A sense of humor is shown in many heads, as in the *St. Joseph*, and a capacity for grotesque effects that is quite Leonardesque, appears in many of the corbel masks. One of the apostles recalls an antique philosopher or poet—a Sophocles or Aeschines; St. Elizabeth is like a Juno.

Although it is true that most of the heads are types rather than portraits, there is an evident study of nature. This is seen, for instance, in the charming youthful head of the Virgin and in the piquant angel at Reims. Some of the finest statues are those dividing the main portal. The *Beautiful Christ* at Amiens, and the severer one at Chartres, the dignified *Virgin* at Notre Dame, the smiling and coquettish *Virgin* at Amiens and the rather self-conscious *Grande Dame* at Reims are all masterpieces. As a composition, one of the most symmetrical and artistic is the tympanum of the left doorway at Notre Dame, with the *Resurrection and Coronation of the Virgin.* Mannerisms and studied richness in drapery appeared later in the century, as in the apostles at the Sainte Chapelle. And the sculptors became more and more artificial as the fourteenth century advanced, until from the north, especially Flanders, came a wave of realism and character study, notable in the school of Burgundy, in the monuments of Dijon, in the tombs of the Dukes of Burgundy and in Claux Sluter's fountain called the *Well of Moses.*

Spain. French artists carried to Spain their decorative system and subjects. There are fine portals at Burgos, Leon and Toro, of the thirteenth century, and sculpture was more abundant here than in Italy or Germany; but though the designs were good, we seldom find the beauty of French work.

Germany. The Gothic movement reached Germany from France quite as soon as, if not sooner than, the corresponding architectural wave. Germany had begun an interesting use of monumental sculpture in the Romanesque age, especially in Saxony and neighboring provinces; and it was here, in the middle of the thirteenth century, that one finds the first works of real genius, with a mastery of technique and expression to rival the French works. These are the Golden Gate of the cathedral of Freiberg, the portals of Magdeburg cathedral and especially the statuary and portals of Bamberg, where the crudity of Germanic realism is modified. The most famous single figure is the equestrian statue of the Emperor Conrad III at Bamberg. There is little of the French idealism or love of pure beauty, little of creation of types; but rather there is a strong personality, sometimes artificial and clumsy. This art reaches great force in certain large figures in the choir of the cathedral at Maumburg, especially the twelve statues of the great nobles. Bold, free, strong and full of life, they have all the qualities and none of the defects of German naturalism, and are the most perfect embodiments of the feudal pride of the Saxons. Perhaps the finest are the Margrave Eckardt and his wife, Uta. Their date is about 1270.

Tiger and Crocodile
An incomparable rendering of animal ferocity. Although in miniature this is fundamentally monumental art. By Barye, the French sculptor.

At Strassburg Cathedral we find other great German masterpieces of a few years later, though in this Rhenish School French influence is much more dominant. The earliest part is the extraordinary *Angels' Pillar* inside the transept, which is still archaic; and the most perfect are the two famous statues of *The Church* and *The Synagogue*, outside the south transept. On the main façade the statues of the *Wise Virgin* and the *Foolish Virgins*, and of the *Prophets*, are less perfect but very striking and dramatic. They show the approach of the rather exaggerated art of the fourteenth century. The grand style now disappears; the center of production shifts to Nuremberg, to Cologne and Ulm.

Besides architectural sculpture the Germans were active in sepulchral monuments and shrines, which are better preserved there than in France, where the Revolution destroyed so much. Terra cotta and wood, also, were more generally used than in France, and here we can see more traces remaining of the polychromy originally in Gothic sculpture.

The Pre-Renaissance. We usually speak of the "revival" of art, in the sense of an early Renaissance, as beginning in Italy during the thirteenth century, with Giotto in painting and Nicola Pisano in sculpture. Yet Italy was far inferior to France during the Gothic age in the amount and quality of her sculpture. Nicola Pisano was her first great sculptor, and the famous pulpit in the Baptistery at Pisa, completed in 1260, his earliest masterpiece. In its bas-reliefs we see an interesting adaptation of Roman, Byzantine and French Gothic models. In the *Adoration of the Magi*, the Virgin is a Juno, and the angel seems taken from some work of the Emperor Justinian. The figures have none of the Gothic vivacity and slenderness, but are majestic and heavy, and an occasional nude figure shows plainly the study of the antique. Another pulpit at Siena is the work of the master with the help of his son Giovanni and several scholars. Here enters a dramatic element which was developed by Giovanni, who is far more of a typical Gothic artist than is his father: his pulpit at Pistoia, in St. Andrea, is his best. The great fountain of the square at Perugia is a joint work. Giovanni entered into the spirit of Gothic symbolism, as is evident in the caryatid figure of his pulpit for the cathedral at Pisa. He became over dramatic in his later works, but several of his statues of the Virgin with the Child are full of dignity.

This school of the Pisani spread over the entire peninsula. At Bologna is the shrine of St. Domenico, while the royal tombs in Naples prove how quickly the new movement conquered the south. In Florence and Orvieto, however, are the school's two most extensive undertakings. The façade of the cathedral of Orvieto is unique in Italy. Four broad piers separate the portals and are covered with a series of low reliefs representing a vast Christian poem in four scenes: *Genesis*; *the Tree of Jesse* with a choir of the Prophets of the Redemption; *the Life of Christ*; *the Last Judgment*. This epitome of the world from Creation is given in a charmingly poetic, and at times dramatic, style.

Giotto's tower in Florence has many five-sided reliefs (fifty-four in all), which were planned by Giotto himself, mainly in the spirit of allegory—the virtues and vices, the arts and sciences, the glorification of labor, commerce, industry and organized society. Of greater beauty and grace are the reliefs in the bronze doors of the Baptistery by Andrea Pisano, mainly devoted to the life of John the Baptist. These charming framed and grouped scenes are of a classic simplicity, and are quite perfect in their directness and grace. They remind one of the best French work, which they certainly equal. The last notable master of this school was Andrea Orcagna whose famous tabernacle at Or San Michele in Florence is a happy combination of architectural design and color with sculpture. This brings us to the eve of the Renaissance.

Of English Gothic sculpture there is little to be said. It is very abundant at Wells cathedral and fairly so at Lichfield and Salisbury, but not well arranged and too much addicted to isolated statuary. There are no individual statues of great artistic beauty as in France or Italy.

The Renaissance. Italy now wrests the leadership from France. The Renaissance was born in Tuscany at the beginning of the fifteenth century, and the revolutionary movement invaded all the arts almost simultaneously. Three men took the lead in the field of sculpture: Donatello, Ghiberti and Jacopo della Quercia.

Earlier Italians. Donatello was by far the greatest, and exercised the widest influence. His *St. George* is one of the famous statues of the world, standing solidly and earnestly, a masterpiece of simplification. On the other hand, nothing more rollicking and joyous can be imagined than his dances of merry children. His portraits are startingly vivid. He hewed great figures out of the rock, and he modeled tiny reliefs of exquisite delicacy. He shaped the first beautiful nude figure since classic times and created, in his *Gattemelata*, the first great equestrian statue since the *Marcus Aurelius*.

Saint George

One of the famous statues of the Renaissance, by Donatello. It has often been called the "Ideal Christian Hero."

Ghiberti, his contemporary, is chiefly famous for the bronze gates of the Florentine Baptistery. He is a connecting link with the Gothic past. In the first gate he imitates so closely the neighboring gate of 1336 by Andrea Pisano, with its small simple compositions, that he seems thoroughly medieval. A few years later he adopted an absolutely opposite scheme for his second gate—a scheme which Michelangelo thought worthy of *Paradise*. Here the scenes were few and large, the figures numerous and small. These reliefs, with their vanishing planes, their picturesqueness and elaborate scenario, struck an entirely new note in sculpture.

Jacopo della Quercia, the third in this early trio, was the forerunner of Michelangelo in his love of anatomy, his dramatic power, and above all in his feeling for mass. This is especially evident in his work at St. Petronio, in Bologna, in the reliefs of the portals in the façade and the group of the Virgin holding the Child. He was at the same time master of a delicate and penetrating charm, which he shows in the exquisite reclining figure of Ilaria del Carreto, on her tomb at Lucca, on a cenotaph decorated with children holding a long wreath, the most beautiful instance of a favorite motive copied from some Roman original.

Later Italians. The latter part of the fifteenth century is so crowded with talent, not only of Florentines (and other Tuscans) but also of Lombards, that it is difficult to single out special men and works. Mino da Fiesole's bust of Bishop Salutati, with its keen, ascetic face, is a highly finished example of Tuscan skill. Among the numerous sepulchral monuments in which decoration and figures were more happily combined than in any other class of works, the Marsuppini tomb by Desiderio da Settignano, and the tomb of Leonardo Bruni by Bernardo Rosellino, stand supreme. Among the pulpits the most harmonious is that in Santa Croce in Florence by Benedetto da Majano.

Robbia School. Luca della Robbia, a serene religious artist, is most noted as the creator of that form of relief sculpture in polychromatic glazed terra cotta known from him as "Robbia ware." It was extremely popular throughout Tuscany and farther south. His nephew, Andrea, almost equaled him in talent and productiveness. Later the coloring became more and more elaborate until under Andrea's son, Giovanni, it was at times crude. The Robbia school was the great representative of religion in the Italian sculpture of the Renaissance, as Fra Angelico and the Sienese artists were in painting.

As the culminating work of the early Florentine school came the greatest equestrian statue the world has seen, the *Bartolommeo Colleoni* in Venice by Andrea del Verrocchio, the faultless ideal of a fearless Renaissance adventurer. Horse and man are one, and full of force and life.

However, the days of masterpieces passed away for a short time; even the men who led the Florentine school just before Michelangelo, such as Sansovino and Rovezzano, were second-rate men.

Michelangelo was essentially a plastic genius, a sculptor "by first intention." It is evident even in his works of architecture and painting. He cut himself loose from traditions and schools. At first he steeped himself in classic sculpture, and imitated it so well in his *Faun* as to deceive the best critics. Then he passed through a phase of normal religious themes, as is evidenced in his *Pieta* at St. Peter's. This work of art, with its highly-finished surface, presents a magnificent group completed before its author was twenty-six years old. Michelangelo reached the full realization of his colossal talent in two works: the tomb of Pope Julius II, which was never completed, and of which the famous statue of Moses was a detail; and the monuments of the Medici at San Lorenzo in Florence, of which the tombs of Giuliano and Lorenzo were almost finished. We have in these works primitive, elemental sculpture used to convey general ideas of life and death. The mystery that has enveloped the reclining figures that we call *Dawn* and *Twilight*, *Day* and *Night*, has been continuous since the day of their execution. The *Lorenzo*, popularly called *Il Penseroso*, is far more than a portrait; it is brooding introspection. No artist before

Michelangelo had so openly played with the human form, and yet none had been so completely an idealist. His heads, especially the *David*, the *Brutus* and the *Lorenzo*, make an undying and vital appeal.

After Michelangelo came a decline. Benvenuto Cellini, to be sure, was an extraordinary technician. His *Perseus* with the head of Medusa shows that he could produce things other than the works of delicate and decorative beauty for which he was famous. Ammanati and Bandinelli were inflated and debased followers of Michelangelo's tempestuous mood. Giovanni da Bologna had better taste, and was the last classicist of any merit.

The French Renaissance. Though Italy certainly overshadowed the rest of Europe during the Renaissance, a great deal of interesting sculpture was produced in France, and its national character is now being more clearly seen. Its greatest representative in the sixteenth century was Jean Goujon, whose influence transformed the French school, combining with it characteristics both Italian and Flemish. His most famous figures are the *Water Nymphs* for the Fountain of the Innocents, in Paris, and the *Diana of the Fountain* for the Chateau at Anet. There is a touch of artificiality in pose and drapery, a self-conscious grace that is not at all disagreeable. The work of his predecessor, Michel Colombe, while quite different from the Italian style, is more closely related to it. There is a great deal of picturesqueness and atmosphere in his relief of *St. George Fighting the Dragon*, made for the Chateau of Gaillon. Germain Pilon left masterpieces in the tombs of Francis I and Henry II at St. Denis. So also did Jean Juste in his tomb of Louis XII.

The German Renaissance. The German Renaissance hardly ever reached a high level. Something seemed to prevent its sculptors from passing beyond a rather commonplace naturalism. One great exception was Peter Vischer. His exquisite shrine of St. Sebald at Nuremberg, with its beautiful apostles, shows Italian influence; his colossal bronze statues of Kings Arthur and Theodore at Innsbruck are quite original, and deserve to take their place beside the Gothic *St. Theodore* at Chartres and Donatello's *St. George*. It is curious that in all Germany, Austria and the Netherlands there is so little during the fifteenth and sixteenth centuries that is at all notable, considering that so much was produced in mere quantity: carved portals, stations of the Cross, altarpieces, sepulchral monuments. It is a national trait that wood should then be preferred to stone or marble by most sculptors. A notable example of this interesting art is the *Madonna of Nuremberg* by Veit Stoss.

Modern Sculpture. The seventeenth and eighteenth centuries were a rather futile period for sculpture. The spirit of the Renaissance was dead; the modern spirit, not yet born. There was nothing real or simple in art; all was artificial, and exaggerated, and designed to display technical skill. Bernini led this baroque style in Italy; Girardon and Puget in France, Andreas Schlüter in Germany. Draperies were inflated, attitudes twisted, compositions overdramatic. The *Vision of St. Theresa* by Bernini is more characteristic of him and of the mawkish religious sentimentality of the age than are his classic pieces, and the same is true of Girardon's monument to Richelieu. Puget's *Milo of Crotona*, *Andromeda* and *Alexander and Diogenes* introduced the manner even into classic themes. The climax of theatrical art so characteristic of the age of Louis XV is embodied in such works as the monument of the *Marshal of Saxony* by Pigalle at Strassburg.

One may perhaps date the real beginning of modern sculpture at the French Revolution, and preface it with Houdon's vivacious figure of *Voltaire*, its prophet. It was at first largely characterized by a new classic revival, necessarily artificial because it had no connection with the age. Canova, a Venetian, and Thorwaldsen, a Dane, were its leaders. Canova's influence became universal. Rome inspired them all.

Moses

Michelangelo's work, now in Saint Pietro in Vincoli, Rome. Designed to adorn the tomb of Pope Julius II. Considered one of the most sublime of all sculptural works.

Canova was an unusually prolific artist. Of his many works the early *Cupid and Psyche* and the *Pauline Borghese* as Venus are especially famous and illustrate his charm of line and softness of texture. The essential coldness of his style, however, kept his art from becoming great.

Thorwaldsen showed dependence on the antique—even more literal and more Hellenic. His frieze at the Quirinal in Rome proves that he was as accomplished in relief work as in statuary. Dannecker spread the new style in Germany; witness his *Ariadne* at Frankfort. Flaxman did the same in England, though his design was better than his modeling. Sculpture as the real reflection of the age had, however, its representatives, and grew stronger with the years. On the Arc de Triomphe in Paris, the stupendous group embodying the French Revolution, known as the *Chant du Depart* and the *Marseillaise*, is a work of vital drama by François Rude. A similar quality appears in his pupil, Carpeaux, whose nervous force is best expressed in the group of the *Dance* (1869) at the Opera in Paris. Barye came also with his wonderful interpretations of animal life, so familiar to Americans, and was followed by the strenuous Frémiet.

In Germany, Schadow created many public monuments and graceful works, well illustrated by his *Queen Louise and her Sister*. Then came Rauch, whose statues are perhaps the finest in Germany; especially is this true of his *Maximilian I* at Munich, and his *Frederick the Great* at Berlin. His pupil, Rietschel, was an excellent artist, but did not reach his master's level. His statues of *Lessing* (Brunswick) and *Luther* (Worms) and his *Pieta* at Potsdam are impressive.

Recent Sculpture. France has been the leader in the last two generations. National schools of sculpture have long since died, so far as style is concerned; the art is becoming rapidly international, and France has struck the keynotes. There has been the greatest variety in her styles. Dubois with his *Florentine Singer*, his *Young St. John* and his tomb of General Lamoricière; and Mercié with his *David*, his *Gloria Victis* and *Quand Même*, were inspired by the Tuscan Renaissance. Another sculptor of high rank was Chapu, whose *Joan of Arc* has been placed in the Louvre. Dalou sometimes suggests a combination of Rubens and the Hellenistic tradition, as in his *Triumph of Silenus*, and sometimes embodies modern realities, as in his *Mirabeau*. His monument to Delacroix is a paroxysm in bronze. Falguiére was a master of marvelous virtuosity; Saint-Marceaux, an artist of unusual imagination.

With Rodin we reach the ultimate break with the academic school, with all traditions, and with all recurrences to past types. He was at times as naturalistic as Donatello in his beginnings; as primeval as Michelangelo without the Italian's idealism. His *Kiss* is an embodiment of passion; his *Thinker*, the ruminant spirit of brute force. The weird group *The Burghers of Calais*, is extraordinarily original and full of power. Rodin's ill-balanced and extreme individualism made his works very uneven, sometimes "monstrous and abnormal."

Noted leaders in France today are: Bourdelle, Maillol, Despiau and Bernard. Less discussed, but perhaps of more lasting worth, are such admirable sculptors as Bouchard, Landowski and Jean Boucher.

Belgium has produced one great sculptor in modern times, Constantin Meunier (1831-1910). His simple and sympathetic renderings of workingmen, and particularly of coal miners, brought him the appellation of the "Millet of the Mines."

Among the prominent English sculptors of the last generation were Thornycroft (*The Mower*), Onslow Ford (statue of Henry Irving), Gilbert and Frampton. Gilbert Bayes, Alfred Drury, Bertram MacKennal, Albert Toft and W. Goscombe John are doing notable work today. In Sweden, the leading name is that of Carl Milles.

In Germany there are many sculptors of distinction, as Lederer, Metzner, Elkan, Hahn, Hoetger, Kolbe, Wackerle and Gaul (the latter making a specialty of animal subjects).

Italy has today, as always, many clever sculptors, but possesses few who can be called great. Bistolfi of Turin, and Andreotti of Florence, are well known.

Most important perhaps of all living sculptors is Ivan Mestrovic, born in Dalmatia in 1883. His *Fragments of the Temple of Kosovo* are among the truly sculptural products of our time. His religious reliefs are deeply tinged by the Byzantine inheritance of his people. His portrait of his *Mother* is a masterpiece.

My Mother
A masterpiece by the Jugoslav sculptor, Ivan Mestrovic. From copy in Art Institute, Chicago.

Brief is the story of sculpture in the United States, but its achievements give great promise for the future. Horatio Greenough (1805-52) was America's first professional sculptor and the first to study abroad. Like his contemporary, Hiram Powers, he was unavoidably influenced by the neo-Classic vogue of his day, and his *Washington*, like Powers' *Greek Slave*, might have been carved in the workshop of Canova. Thomas Crawford made a grandiose pediment for the national capital, and a lamentable equestrian *Washington* for Richmond. Other pioneers were Thomas Ball, Henry Kirke Brown, Randolph Rogers, John Rogers, William W. Story, Erastus D. Palmer, and William H. Rinehart. John Q. A. Ward was long the dean of American sculptors and will be remembered for his fine *Henry Ward Beecher* in Brooklyn. Our greatest sculptor was Augustus Saint-Gaudens (1848-1907) who, from his *Farragut* to his second *Lincoln*, produced a series of magnificent works. Among these are the standing *Lincoln*, the *Puritan*, the *Shaw Memorial*, *Adams Memorial* and *General Sherman*. Daniel Chester French has likewise created a host of admirable works, like the *Angel of Death and the Young Sculptor*, and the great *Lincoln* in Washington. He is the author of several of our finest equestrian statues. Frederick MacMonnies (1863) has won a great name both at home and abroad. He lived in France for many years and there he modeled his *Stranahan*, *Nathan Hale*, *Shakespeare*, *Bacchante* and *Columbian Fountain*. Equally well known abroad is Paul Bartlett whose *Columbus* and *Michelangelo* for the Congressional Library are very distinguished conceptions. His equestrian *Lafayette* stands in the court of the Tuileries in Paris. George Gray Barnard is characterized by much originality and vigor. His large groups for the State House of Pennsylvania are among the most remarkable of American sculptures. Herbert Adams has modeled female heads of exquisite beauty. MacNeil, Weinman, Dallin and Fraser are a few among an army of well trained artists. Of the later school, products of the American Academy in Rome, we have such men as Manship, Polasek, Keck, Fry, Gregory, Jennewein and others. Never has there been such skill in our studios, never so much demand for good sculpture. The outlook for the art in this country is indeed bright.

Adams Memorial
This sculpture, by Augustus Saint-Gaudens, in Rock Creek Cemetery, Washington, D. C. It is variously called "Grief" and "Death" and sometimes "The Peace of God." The greatest work thus far produced in America.

LEADING SCULPTORS

Italy
- Andreotti, Libero (?)
- Benedetto da Majano (1442–1497)
- Bernini, Giovanni Lorenzo (1598–1680)
- Bistolfi, Leonardo (1859–)
- Bologna, Giovanni da (1525?–1608)
- Canova, Antonio (1757–1822)
- Cellini, Benvenuto (1500-1572)
- Desiderio da Settignano (1428–1464)
- Donatello (or Donato) (1385–1466)
- Ghiberti, Lorenzo (1378–1455)
- Michelangelo Buonarroti (1475–1564)
- Mino da Fiesole (1431–1484)
- Orcagna, Andrea (1316–1376)
- Pisano, Andrea (1270?–1348)
- Pisano, Giovanni (1250–1329)
- Pollaiuolo, Antonio (1432–1498)
- Quercia, Jacopo della (1375?–1438)
- Robbia, Andrea della (1435–1525)
- Robbia, Luca della (1400–1482)
- Rossellino, Antonio (1427–1478)
- Rossellino, Bernardo (1409–1464)
- Sansovino, Jacopo (1486–1570)
- Verrocchio, Andrea del (1435–1488)

France
- Barrias, Louis Ernest (1841–1905)
- Barye, Antoine Louis (1796–1875)
- Bernard, Joseph Antoine (1870–)
- Bouchard, Henri (1875–)
- Boucher, Jean (1870–)
- Bourdelle, Emile Antoine (1861–1929)
- Carpeaux, Jean Baptiste (1827–1875)
- Chapu, Henri (1833–1891)
- Coustou, Guillaume (1677–1746)
- Coustou, Nicolas (1658–1733)
- Coysevox, Antoine (1640–1720)
- Dalou, Jules (1838–1902)
- D'Angers, David (1788–1856)
- Despiau, Charles B. (1874–)
- Dubois, Paul (1829–1905)
- Falguière, Alexandre (1831–1900)
- Fremiet, Emmanuel (1824–1910)
- Girardon, François (1628–1715)
- Houdon, Jean Antoine (1741–1828)
- Landowski, Paul (born in Poland) (1875–)
- Maillol, Aristide (1861–)
- Mercié, Antonin (1845–1916)
- Pigalle, Jean Baptiste (1714–1785)
- Puech, Denys (1859–)
- Puget, Pierre (1620–1694)
- Rodin, Auguste (1840–1917)
- Rude, François (1784–1855)
- Saint-Marceaux, Charles René de (1845–1915)

Germany
- Begas, Reinhold (1831–1911)
- Dannecker, Johann Heinrich (1758–1841)
- Elkan, Benno (1877–)
- Gaul, August (1869–)
- Hahn, Hermann (Bavarian) (1868–)
- Hildebrand, Adolf (1847–)
- Hoetger, Bernhard (1874–)
- Hundreiser, Emil (1846–)
- Klinger, Max (1857–1920)
- Kolbe, Georg (1877–)
- Lederer, Hugo (1871–)
- Lehmbruck, Wilhelm (1881–)
- Rauch, Daniel Christian (1777–1857)
- Rietschel, Ernst (1804–1917)
- Schadow, Johann (1764–1850)
- Schluter, Andreas (1664–1714)
- Siemering, Rudolf (1835–1905)
- Stoss, Veit (1431–1533)
- Tuaillon, Louis (1862–)
- Vischer, Peter (1460–1529)
- Wackerle, Joseph (?)

England
- Bayes, Gilbert (1874–)
- Brock, Thomas (1847–)
- Drury, Alfred (1859–)
- Flaxman, John (1755–1826)
- Ford, E. Onslow (1852–1901)
- Frampton, Sir George J. (1860–)
- Gilbert, Alfred (1854–)
- John, Sir William Gascomb (1860–)
- MacKennal, Bertram (?)
- Thornycroft, W. Hamo (1850–)

Switzerland
- Haller, Hermann (1880–)

Netherlands
- Sluter, Claus (? –1406)

Belgium
- Meunier, Constantin (1831–1905)

Yugoslavia (Dalmatia)
- Mestrovic, Ivan (1883–)

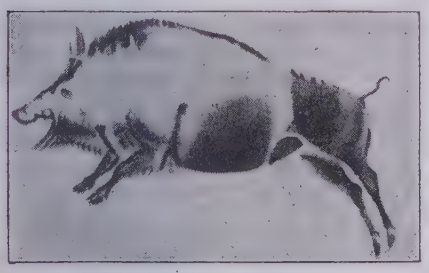
Sweden
- Milles, Carl (1875–)

Denmark
- Thorwaldsen, Bertel (1770–1844)

Austria
- Metzner, Franz (1870–)

America
- Adams, Herbert (1858–)
- Aitken, Robert I. (1878–)
- Bachelder, Evelyn Longman (1874–)
- Ball, Thomas (1819–1911)
- Barnard, George Grey (1863–)
- Bartlett, Paul (1865–)
- Bitter, Karl (born in Vienna) (1867–1915)
- Brown, Henry Kirke (1814–1886)
- Crawford, Thomas (1813–1857)
- Dallin, Cyrus E. (1861–)
- Fraser, James E. (1876–)
- French, Daniel Chester (1850–)
- Frishmuth, Harriet W. (1880–)
- Fry, Sherry E. (1879–)
- Grafly, Charles (1862–1929)
- Greenough, Horatio (1805–1852)
- Gregory, John (born in London) (1879–)
- Hoffman, Malvina (1887–)
- Hyatt, Anna Vaughn (1876–)
- Jennewein, Carl Paul (born in Germany) (1890–)
- Keck, Charles (1875–)
- MacMonnies, Frederick (1863–)
- MacNeil, Hermon A. (1866–)
- Manship, Paul (1886–)
- Mills, Clark (1815–1883)
- Palmer, Erastus D. (1817–1904)
- Polasek, Albin (born in Czechoslovakia) (1879–)
- Powers, Hiram (1805–1873)
- Proctor, A. Phimister (born in Canada) (1862–)
- Rinehart, William H. (1825–1874)
- Rogers, John (1829–1904)
- Rogers, Randolph (1825–1892)
- Saint-Gaudens, Augustus (born in Ireland) (1848–1907)
- Scudder, Janet (1873–)
- Story, William W. (1819–1895)
- Taft, Lorado (1860–)
- Vonnoh, Bessie Potter (1872–)
- Ward, John Q. A. (1830-1910)
- Warner, Olin (1844-1896)
- Weinman, Adolph A. (born in Germany) (1870–)
- Zorach, Wm. (born in Russia) (1887–)

PAINTING



THE art of painting is expression in terms of color, light and dark, and line. The spatial arrangement of these elements, the visual form that constitutes a painting, has two aspects—representation and design.

Representation refers to the meaning suggested by the arrangement, for instance, a solid body, a flower, a spacious landscape, a trait of character, a story. Design refers to the arrangement as such. Design and representation cannot be separated; they grow together in the creative mind of the artist. Any change in representation affects pattern and any change in pattern affects meaning—they are two aspects of a single whole. Artists vary in their emphasis, some being greatly interested in representation, others caring only for the fine organization of their color, light and line.

Fine quality in design seems to depend on the vitality and order of the pattern. Fine quality in representation seems to depend on the vitality and order of the meaning. There are various ways in which such order is manifested in a work of art: in balance, in similarity or repetition, in easy sequence or clearly felt gradation, and in that final unity, like that of a living organism, in which every part is essential to every other part. These are the so-called "principles of design" but no great painting was ever achieved merely by following them. The life and order of a great work of art is so complex and so subtle that it eludes our crude attempts to analyze. As one critic has said, artists can only work for order and hope for beauty.

ANCIENT PAINTING

Old Stone Age. The oldest paintings that we know were painted thousands of years ago by men of the Paleolithic or Old Stone Age on the walls and ceilings of caves in southern France and northern Spain. These men were hunters and painted their familiar world, a world of animals—the reindeer, wild horse and mammoth, the bison,

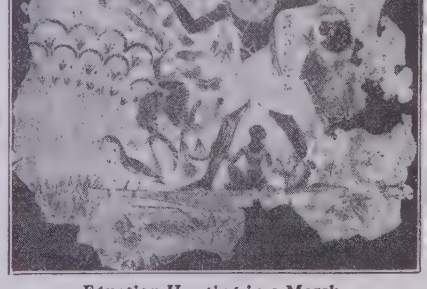
Galloping Wild Boar
Painted in a cave at Altamira, Spain. Perhaps about 15,000 B.C.

wolf and wild boar. Sometimes they were shown at rest or grazing, but more often they were depicted running, galloping, fighting; and always they were painted with the most astonishing keenness of vision, and with a line that was swift and sure.

There was a development covering thousands of years, from the early drawings cut into the rock with a sharp flint, or sketched in red or yellow chalk, to the great polychrome period of some 15,000 years B.C., when the strong contour lines were filled in with shaded color masses of red, yellow, brown and black—earth colors mixed with animal oil or fat.

Probably later, perhaps toward 10,000 B.C., a different people in the south and east of Spain left in caves and under overhanging rocks some remarkable paintings of human figures. These people had the bow and arrow, and their paintings were largely of bowmen in action—in the hunt, fight or war dance; occasionally there were other scenes, such as a man taking honey from a tree while the angry bees fly about him. There was no such realism of form or rhythm of line as was shown by the animal painters, but there was a great aptitude for expressing movement.

Hind
With small drawing of a bison. Painted in a cave at Altamira, Spain. Perhaps about 15,000 B.C.



New Stone Age. By 10,000 B.C. it is supposed that the climate and geography of Europe had become about the same as it is today; and with this change the Paleolithic men seem to have disappeared. The people of the Neolithic or New Stone Age were a different people with a very different art. Neolithic man learned to cultivate grain and domesticate animals; he built houses, wove cloth and made pottery. In Europe his painting was confined to geometric designs on pottery—lines, zigzags, curves, spirals—with rarely any suggestion of the human figure. Such designs had more meaning for him than they have for us, but the full representation of the Old Stone Age had completely disappeared.

Egyptian Painting. In the years between 4000 and 3000 B.C., when Europe was still in the Stone Age, Egypt had discovered metal, invented a system of writing and started to build up a high civilization. Before 2000 B.C., paintings were not very numerous, and we must trace the pictorial tradition in painted low reliefs. But after that there is a continuous history of painting down to the Christian Era. The Egyptian loved the out-of-doors so much that he brought it into his house, painting the floors with lotus, ducks, birds and fishes; the walls with trees, and the ceiling with stars in a blue sky. But the houses have perished, and only fragments of such painting remain. There were also paintings in temples, in papyrus manuscripts and on the coffins of the dead; but most Egyptian painting is found on the walls of tombs.

This tomb painting is not a gloomy art: far from it. There are pictures of the Egyptian's gods, of his adventures in war, but especially of his own intimate little world. He loved life and all its hard-won luxury and, being quite materialistic, he wanted depicted on the walls of his tomb all the good things of his life on earth as reassurance that they would continue in the life hereafter. We see him gliding in his reed boat in the marshes hunting ducks, perhaps accompanied by his wife and daughter, who are gathering lotus; or harpooning fish, or feasting at a banquet where dancing girls sway to the music of harps. We see his butchers cutting, his masons building, his slaves reaping and threshing the grain, picking grapes and making wine.

The Egyptian painter worked in outlines and flat color tones: long, swift, continuous lines strong harmonies of vivid blue, green, red and yellow. He liked symmetry, and since he ignored light and shade, volume and distance, his painting is flat and decorative.

Representation caused him trouble. At first he could not see in his imagination the figure as a whole, from a single point of view. He drew the face in side view, eye front, shoulders front; and then, by a mysterious twist he drew the body below the waist in side view. This rendering became traditional and scarcely changed through the centuries. By the Eighteenth Dynasty (1580-1350 B.C.) considerable progress had been made; greater freedom in pose and movement, more nowing line, overlapping of figures, an occasional face in front view. In the time of Iknahton (1375-1358), the great king who believed in one God, there was a great outburst of naturalism; but with his son-in-law Tutenkhamon came a reversion to the old forms in art as in religion.

Egyptian Hunting in a Marsh
From a Theban tomb of the Eighteenth Dynasty (1580–1350 B.C.). In the British Museum, London.

There is no deep space in Egyptian painting. If an object is to appear as behind another, it is placed above. A pool of water is drawn in floor plan and not as it appears to the eye. The flesh of men is always dark, that of women light. But in spite of all his difficulties the Egyptian tells his story well, with expert craftsmanship and a feeling for fine design.

Aegean Painting. In Europe it was the

part nearest Egypt that first emerged from the Stone Age—the lands around the Aegean Sea, Greece, Asia Minor and the nearby islands, especially Crete. Apparently it was in Crete that the new culture arose and attained its greatest height, and from there spread throughout the region. Excavations of the great palace at Knossos (built about 1500 B.C.) have revealed a series of frescoes in vivid colors that tell a story of luxury and splendor and of an amazing art.

We see a strangely modern looking people with irregular European features, pinched waists, elaborate coiffures, tight bodices and flounced skirts. A youth marches in procession bearing a silver vase, a naked boy picks crocuses, women in low cut gowns watch a bull fight from a balcony, and youths and maidens engage an angry bull. A vivacious young girl, with a curl in the middle of her forehead, presents her profile with a large front-view eye—for the Cretans had the same trouble with the human figure as did the Egyptians.

Ceremony at a Cretan Tomb

Painted on the side of a sarcophagus. About 1450 B.C. On the right a boat and two calves are being offered to the spirit of the dead man. On the left a priestess pours a libation into a vase placed between columns surmounted by double axes. In the Candia Museum, Crete.

A fresco from Melos (perhaps 1600 B.C.) shows flying fish darting through the water in rhythmic movement.

Cretan paintings, like Egyptian, are in outlines and flat color tones; they have no distance, neither have they light and shade; and the similar convention of brown for the skin of men, white for that of women is seen. But their line is less continuous; it has a quicker and more lively tempo and the contours have more individuality. While not so splendid in pattern, the Cretans knew better how to seize the dramatic moment and to create the impression of movement and of life.

Greek Vase Painting. It was an invasion of barbarians from the north that finally destroyed the Aegean civilization. About 1400 B.C. the palace of Knossos was burned; by 1100 the whole of Aegean culture had been overturned. Gradually this new people developed into the Greeks of historic times, and the Cretan world lived only in Greek myth and legend.

The earliest Greek painting (1100-800) consisted of geometric designs on pottery, with human figures and animals almost as geometric as the bands and zigzags. The eighth and seventh century pottery showed contacts with the Near East in its rows of animals and backgrounds filled with rosettes. In the sixth century, sudden progress foretold the glory of the fifth. Athens began to manufacture a splendid ware of great refinement of shape and beauty of decoration. There were water jars, mixing bowls, drinking cups, wine pitchers, oil flasks. In the sixth century they were black-figured, the decoration being painted in black glaze on the natural red-orange of the clay, with details of features and drapery scratched into the glaze, disclosing the clay beneath. The flesh of the woman was painted white, and white and purple were used for details.

Toward 500 B.C. this style was gradually being supplanted by the red-figured, in which the background was painted with black glaze and the figures and decoration were left in the reddish clay. Now all the details, instead of being cut into the glaze, could be freely executed with the brush. All through the black-figured period the Greeks had been making progress in representation, but in the first half of the fifth century they made the most amazing progress. They learned not only how to draw a consistent profile but also how to show three-quarters and front view. The figure becomes flexible; it bends and twists; its contours suggest some volume and solidity; stiff draperies change to flowing folds.

These vase pictures tell the stories of the Greek gods—those very human gods made in the image of man and enjoying all that he enjoyed—and of the heroes, the labors of Hercules, the adventures of the Trojan War. And they give a very remarkable picture of Greek daily life; we see children at school, women weaving, athletes at their games. There is still no deep space—a mountain is indicated by a tree, and the sea by dolphins. But there is always a splendid sense of pattern in line and mass.

Greek Painting. These humble vase paintings, which flourished until the fourth century B.C., are one of our best clues to the mural and panel painting of Greece, all of which has perished. This loss is a great tragedy in art history, for we know that the Greeks esteemed their painting as highly as their sculpture. Literature tells us about the famous painters, such as Polygnotus (active 480-450 B.C.), who still painted in outlines and flat color tones but who introduced the new freedom in representation that is reflected by the vases; it also tells us about the theatrical scene painters of the middle of the century who were interested in deep space and perspective and about Apollodorus who introduced light and shade and thus determined the future of European painting.

In the fourth century, murals for the home as well as for temple and public building became popular. Panel paintings increased. Portraits and scenes of everyday life rivaled the ancient myths and national wars. The conquests of Alexander were of tremendous importance in the history of art. After his death in 323 B.C. Greek culture was spread over all his vast empire. Athens yielded to new art centers in Asia Minor and in Egypt. Greek art thus transported to the Near East was destined to travel even to China and influence the art of the Far East. In this Hellenistic period (323-146 B.C.) painting rapidly became more expressive of emotion, of movement, of individual character; costumes grew realistic, landscape appeared—all this, however, often at the cost of great design.

Roman Painting. Rome in the second and first centuries B.C. became mistress of nearly all the countries bordering on the Mediterranean and of western Europe as well. From the third century her victorious generals had collected works of Greek art and pillaged conquered provinces. But the first century B.C. and A.D. saw a golden age of art production in Rome herself. There are many paintings of this period, some in and about Rome, but most from the excavated cities of Pompeii and Herculaneum, buried by Vesuvius in 79 A.D. The artists were mostly Greek or Greek trained. Many of the paintings were copies of old Greek works of the fifth and fourth centuries, others were in the Hellenistic mode of the day. Design often suffers, but there is convincing expression of the volume and weight of the modeled figures, and variety in pose and action.

These pictures, framed by painted architecture, give the Roman house, with its few windows, the effect of opening out on gardens and spacious vistas. They give an impression of bright color in subdued light, of garlands of fruit and flowers, gods and goddesses, half veiled dancers. Cupids play at being merchants, goldsmiths, wine dealers; they race in chariots on land, and on crabs and dolphins on the sea.

Landscape backgrounds had probably originated at Alexandria in Egypt, but on Roman soil they ceased to be mere backdrops and began to give the illusion of real space in which the figures took their proper places. This was the Roman contribution to Hellenistic naturalism.

Early Christian Painting. From the early years of the Christian Era we have paintings in the catacombs of Rome—those galleries below the ground where the early members of the new faith, forced to secrecy, buried their dead and held certain services. These frescoes belong to the second to fourth century, most of them probably to the fourth. The beginnings of Christianity caused no more upheaval in Roman art than in Roman life. Early Christian artists were Roman artists working in the Hellenistic style. Decorative settings were quite Pompeian. Only the subject matter was new—the Greek and Roman story was supplanted by the Jewish, and many of the old pagan forms were used as symbols to express new Christian meanings. The great change was in the quality of the painting; it became very poor. Design fell apart, and figures lost their relation in space as well as in meaning.

In the fourth century, when Christianity became a legal religion, Christians emerged

from the catacombs and began to build churches. The fifth century was a period of rich decoration of Christian buildings, mostly in mosaic with great splendor of color and gold. Ravenna was the chief center. The first frescoes and mosaics were distinctly classical; but in the sixth century a new style came in, called "Byzantine" because it was brought from Byzantium (capital of the Eastern Roman Empire) and the Near East.

Byzantine Painting. Byzantine was really an old Greek style that had been given an oriental point of view. When this Greek style traveled to the Near East, the Asiatic artists gradually flattened the rounded figures of the Greeks and turned their light and dark into a decorative pattern. We can trace this flattening out of the Greek forms through Asia Minor and Syria and even down to Egypt. Christian illuminated manuscripts best tell the story. These are the early Christian books written by hand on vellum, lavishly illuminated in gold and colors, and illustrated with pictures called "miniatures."

In the sixth century, when the mosaicists of Byzantium came to decorate the churches of Ravenna with pictures of Christ and the Virgin, solemn processions of apostles and of saints, gorgeous portraits of the Emperor and his court, they brought with them this new Eastern style which became so popular that it dominated art in Italy for centuries. Although highly decorative and emotional in its rich color, gold ground and rhythmic pattern, it was from the start quite lacking in any physical reality. Gradually it declined into mere lifeless repetition in which even the fine qualities of Byzantine pattern finally were lost.

But in the eleventh century there came a new period of building, and decoration received a new wave of influence from the Near East. This was the developed Byzantine style, still highly decorative and otherworldly, but not so flat, not so lifeless. Gold backgrounds are occasionally pierced by a clump of trees; figures show considerable modeling and are sometimes in vigorous movement. Painters, perhaps from Alexandria, who had kept alive the old Hellenistic spirit, must have given new life to early Byzantine art. It was still, however, an unrealistic art, solemn and gorgeous, well planned to inspire the awe and reverence that the medieval church desired and, through its color and its line, to create a religious mood. It remained the style of Italy until the thirteenth century.

EARLY ITALIAN PAINTING

In the last years of the medieval period there came about the changes that in the thirteenth century ushered in a new culture and a new art—the Renaissance or rebirth which reached its climax in the sixteenth century. The Crusades, the growth of the cities, the fervent religious revivals, all played their part in the tremendous stir of thought and feeling that characterized the thirteenth century. Men no longer looked to a future life as the only one of value but enjoyed their part in the present world.

A new naturalistic art was the result of two discoveries: the old naturalism of ancient art, now very congenial, and a fresh vision of the world of nature and of simple human things. In this new vision there was no greater influence than that of St. Francis of Assisi who brought man back to the nature from which the earlier Christianity had torn him. St. Francis praised the Lord for the earth and all its creatures, for the sun and moon and stars, for his brother the wind, for his sister water and brother fire. In 1226 he died, and immediately there grew up about him a whole cycle of picturesque stories, with a local Italian background, that furnished the artist with a new and very human world.

Early Florentine Painting. The great church erected over the tomb of St. Francis at Assisi has been called the cradle of Italian painting, for on its walls we find the beginning of almost all that was to come. There Cimabue, first of the Florentine school, tried to make the old Byzantine forms express the new fire and passion. There the colder

The Miracle of the Spring

Probably painted or designed by the Florentine, Giotto, at the end of the thirteenth century. In response to the prayer of St. Francis a spring appears to quench the driver's thirst. In the Church of St. Francis at Assisi.

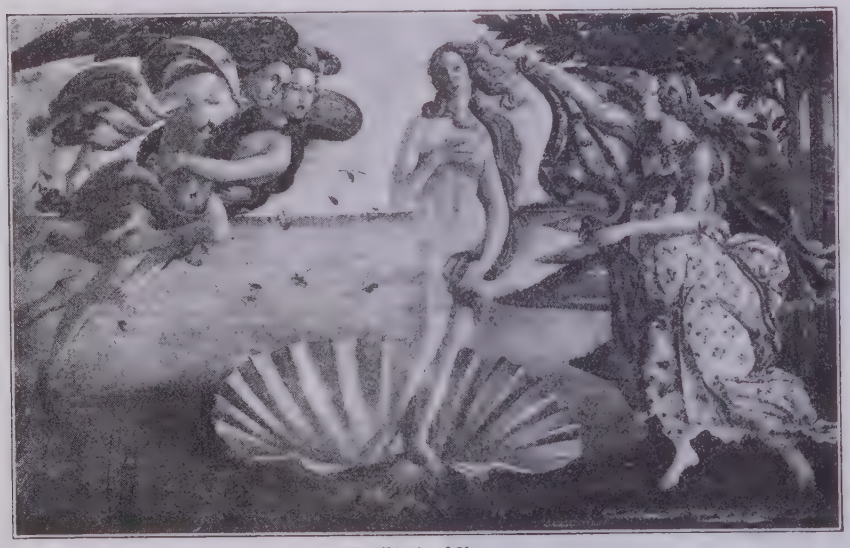
Cavallini of Rome drew his solid forms inspired by old Roman sculpture. And there Giotto, their young assistant, learned from them both and then created a new form of expression that was to determine the whole future of the art of Florence.

We are not certain as to what his share was in the fine series of St. Francis stories at Assisi—*St. Francis Preaching to the Birds*, *The Miracle of the Spring*, and many others. But in the Arena Chapel at Padua we are on sure ground. There Giotto told the story of the Virgin, her birth and childhood, her suitors and her marriage; there, also, he told the story of Christ, from his birth and the flight into Egypt through all the episodes of his life to that final scene of the women mourning over his pale body, while the men stand by in silent, helpless grief, and frantic little angels fly about the sky. He turned the whole of the Arena Chapel into a gallery of such pictures, all in soft, bright colors against an azure ground that suggests the sky.

His figures are massive, sculptural. Solid bodies underneath the clothes are suggested by the simplest line and light and shade. There is little space—a tree stands for a landscape, a stone portal for a town. There are troubles with perspective, but such difficulties pass unnoticed in the dramatic telling of the story and the unity of the design.

In 1337 Giotto died. After that all the painters of Florence adopted his manner, but throughout the fourteenth century not one approached his height. At most they made some progress in representation. As religious intensity lessened, the Bible stories tended to become events of the day, rich in incident and detail. So naturally there was improvement in showing landscape, architecture and objects of everyday life.

Sienese Painting. The founder of the Sienese School was Duccio, who lived about the same time as Giotto. In Siena the new naturalism never did away with old Byzantine ideals. Painters still delighted in rhythmic pattern of line, in rich color, brocaded stuffs, inlay, ornament. And they began to care very much for space, but the figures within the space had a tendency to flatness, and even when highly modeled had not the solidity of Giotto's. Space, harmonious line and lack of insistence on the physical gave the Sienese painting a religious feeling akin to that of Byzantine, but tempered with a sweetness of expression quite unlike the old Byzantine gloom.



Duccio's altarpiece executed for the Cathedral of Siena contains the elements of all later Sienese painting. On the front is the Virgin with the Child, enthroned in majesty, encircled by angels. At her feet kneel the patron saints of Siena; beside her extend long lines of girl martyrs and bearded evangelists. It is a flat decorative pattern of gold, deep color, flowing line. But on the back are thirty-eight scenes from the life of Christ and the Virgin, each a lively narrative, not so simple and dramatic as in Giotto, but with even more naturalism. In *Christ Entering Jerusalem*, for instance, the city towers stretch into the distance; an orchard appears beyond a wall, with people in the trees; a great crowd of diverse types streams from the city gate.

Sienese painting developed along these two lines; the decoration in line and color, and the narrative. Simone Martini of the next generation told some sprightly tales in paint, but he was chiefly the artist of the decorative altarpiece as shown in his exquisite *Annunciation* in the Uffizi in Florence. Ambrogio Lorenzetti, however, was the good story-teller. Sienese art had considerable influence on individuals in other Italian schools and even influenced French art when Simone Martini was called to Avignon in 1339 to paint at the court of the exiled pope. But for the most part it could not withstand the pressure of other schools, and although Siena continued, even in the fifteenth century, to produce artists of the old ideal, such as Sassetta, it was an ideal so little congenial to the spirit of the Renaissance that it finally died away or merged with other tendencies.

Fifteenth Century in Florence. Masaccio came at the beginning of the fifteenth century and lived only twenty-seven years. As one critic has said, he was Giotto born again and instantly making his own all that

had been gained in the years that came between. His figures are majestic in their breadth and mass; they look like real people and one can move around and among them. Both architecture and landscape assume a more normal relation to the figures; there is deep space and atmosphere—objects become increasingly blurred as they retreat. Light is used not merely to model up the figure but is a real light, casting shadow. There is interest in the nude and in facial expression. And the story-telling is as simple and direct as Giotto's.

As far as the religious subject is concerned, Masaccio is a true child of the approaching Renaissance. He humanized it, converted it into a story of man and his immediate world. At times he even let religious meaning be overpowered by some human element, such as the powerful realism of a naked man shivering with cold in his *St. Peter Baptising the Heathen.* As the century advanced, the religious subject was to yield more and more to other interests. Portraits became common, with plain or landscape background. There were battles, tournaments, historical scenes, and finally many subjects from ancient Greek and Roman literature, then being eagerly read in the great revival of classical learning that was the dominating characteristic of the Renaissance.

The Birth of Venus

Painted about 1487 by the Florentine master, Botticelli. Venus, born of the sea, is blown by the winds to an island. A nymph brings a rose-colored mantle to cloak the goddess. In the Uffizi, Florence.

All through the fifteenth century painters thought about the same things as did Masaccio. There were exceptions, it is true. The monk, Fra Angelico, for instance, somewhat older than Masaccio, showed in certain works that he was not unaffected by the new realism; but he preferred a pattern of sweeping rhythmic line and of bright harmonious colors. He is always deeply religious and has something in common with the spirit of Siena and also with the earlier illuminators of manuscripts.

LATER ITALIAN PAINTING

Early Renaissance in Florence. For the most part, however, fifteenth century painters carried forward the interests of Masaccio. They were not content with expressing the large essentials of form and movement. They studied anatomy because they wanted to be able to show the body in every variety of posture and of movement. They studied perspective to help them in showing the changes that objects undergo as they appear at increasing distance from the eye. They were ambitious to represent deep space, the vista of a long room, the far-sweeping Tuscan landscape. Sometimes they were so intent upon what they were representing that they quite forgot design and became recorders of facts instead of artists. But this was never true of the great men of the school. Their ability to show deep space and movement and three-dimensional form only added to the richness and variety of their expression and design.

Uccello had a passion for perspective and is sometimes rather amusing in his exaggeration of the rate at which his distant hills recede, and in those battle scenes where he fills the ground with broken lances, armor, dead cavaliers—all directed toward the "vanishing point." But he uses the new lines and spaces to make very rich designs.

Most powerful of all the realists was Castagno who knew all the secrets of bone and muscle and built up three dimensional forms of tremendous vigor and powerful design. Antonio Pollaiuolo made a systematic study of anatomy. He contributed an extraordinary knowledge of movement, especially of the nude figure fighting, wrestling or in other violent action.

Piero della Francesca, although an Umbrian (the Umbrian school derived originally from Siena), was in spirit Florentine. He wrote a treatise on perspective, but apparently his scientific interests only helped him as artist for he became one of the greatest designers of his day.

However, not all painters made contributions of this sort. Many, notably Fra Filippo Lippi and Ghirlandaio, were content with illustrating the stories and depicting the panorama of the Florentine life of their time. Especially do individual Florentines live for us in the amazing portraits of Ghirlandaio.

High Renaissance in Florence. Botticelli and Leonardo da Vinci both lived into the sixteenth century. Botticelli springs from Fra Filippo Lippi and Pollaiuolo, and his early work is what one might expect from an accomplished painter with his training. But he turned aside to indulge a passion for movement, not only of moving figures and fluttering draperies, but also of pure line—long and quiet or swiftly changing as a flame. He was quite willing to distort the figure, twist and bend it, lengthen legs and arms, if thereby he might better express its movement or weave his lines into a more living arabesque. He gives us idylls of the ancient world. Venus, born of the sea, sails shoreward, lightly poised upon a shell and wafted by the winds; or watches the coming of Spring, blown in by the West Wind, while Flora scatters flowers and the Graces dance for Mercury. But these visions of the ancient world after so many centuries are seen through Tuscan eyes and tinged with melancholy.

Leonardo cared for light and shade as Botticelli cared for line, not only for the sake of form but for its own sake, for the pure melody of its gradations. Leonardo used without a trace of effort all that the Florentines had achieved in representation since the days of Giotto. His figures surpass any before in delicate modulations of light and shade that suggest flesh as well as bone and muscle. His outlines waver in a veil of atmosphere. Landscape backgrounds, filled with air, recede into a far and luminous distance. Oil painting, which had come in during the fifteenth century, made possible a softer edge than tempera. His religious subjects are very human. His Christ Child is a real baby. His *Last Supper* is a dramatic rendering of the effect of one startling sentence, "One among you shall betray me," on twelve different men.

High Renaissance in Rome. Michelangelo was quite unlike Leonardo. He was chiefly a sculptor and wanted no lost edges or veil of air to soften the massive bulk and structure of his figures. He bends them back and forth in space in splendid balanced forms, and stops at no exaggeration that would increase the solid weight or rhythm of their forms. His great work is the ceiling decoration of the Sistine Chapel in Rome. A multitude of gigantic figures are held together by moving line and a subdued color tone of gold and violet. The subject is the drama of Genesis, the Creation and Fall and man's continued struggle. Painted architecture and nude athletes connect the paintings, and supporting this framework are great seated figures of sibyls and of prophets. Michelangelo is the culminating figure in Florentine expression of form and movement.

Raphael was not a Florentine but went to Florence in 1504 and fell under the spell of Leonardo and Michelangelo. He was Umbrian and he reflects all the outside influences of the Umbrian school—Sienese line and pattern, sweetness of facial expression and fondness for space, modified by Florentine realism, with its vigorous form and movement, and its powerful design. Raphael was always the skillful adapter of traits of other men, but he did create a combination that was quite

his own. In 1508 he was called to Rome to decorate certain rooms in the Vatican, and it is in these vast murals and in his masterly portraits rather than in his story-telling pictures and long series of Madonnas that his real achievement lies. His major interests were in line and in space, which he carried back further than had other Italian painters, and in splendid symmetrical designs.

Madonna and Child

By Baldovinetti, Florentine painter of the fifteenth century. The Virgin is placed against a landscape of hills and winding rivers and a pale blue sky. She wears a deep red robe and a mantle of old blue. In the Louvre, Paris.

Early Renaissance in Venice. In Venice there was such close relation to the East that the Byzantine influence lasted longer than elsewhere in Italy. In the fourteenth century it was softened by a new naturalism more suited to this gay, luxurious, nature-loving people. But it was not until the early years of the fifteenth century that Venetian painting was really stirred into new life. Then Sienese and Florentine traditions came to Venice through the visiting Umbrian painter, Gentile Fabriano, and his Verona follower, Pisanello.

The movement was carried on by Jacopo Bellini, the so-called "father of Venetian painting," and his sons Gentile and Giovanni. Jacopo's daughter married Mantegna of Padua, and this brought a fresh outside influence into Venice. Padua more than any other Italian city was under the spell of antiquity. Mantegna studied Squarcione's famous collection of ancient sculpture and whenever possible he used in his paintings Roman architecture, costumes and details of every sort. His fine form did not come from the antique alone—he knew also the frescoes of Giotto in the Arena Chapel and other work from Florence.

The early works of Giovanni Bellini show the Paduan style of Mantegna in their form and severe contour. But gradually Giovanni begins to modulate his light and dark, to clothe with flesh the skeleton. His style broadens; rich color takes on the beginning of Venetian glow; pastoral backgrounds foretell Giorgione's poetic landscapes. Giovanni lived to be ninety years old and took part in the whole development of Venetian painting from the Paduan influence to the triumph of those broad, simplified surfaces of light and color, with edges lost in atmosphere, that were created by his great pupils, Titian and Giorgione.

Venetian painting stands primarily for light and color. It never deserted the solid structure of the body but saw it in terms of light and color. It did not emphasize line as did Florentine painting—line, color and light entered together into Venetian design. Oil technique was very helpful in producing effects of light and air. Venetian art was not religious; it was quite worldly and delighted in depicting the joy of living. The Venetian loved beautiful textures, picturesque costumes, architecture, processions and pageants, civil or religious. He treated religious subjects in an intimate, everyday fashion. Carpaccio's *Vision of St. Ursula* becomes a picture of a Venetian room in early morning light, with a young girl asleep. The altarpieces of Madonnas and saints are in reality pictures of happy, healthy Venetians. Humanizing the religious subject removed symmetry of design in favor of an equally well balanced but more natural grouping. There is new emphasis on the nude and on landscape.

High Renaissance in Venice. With Giorgione we approach the High Renaissance. He abolishes the edge, discovers the color in deep shadows, builds his forms in broad masses of rich, glowing color. In his *Sleeping Venus* at Dresden he also weaves his lines into fine rhythmic pattern. Landscape is a natural outcome of feeling for color and light. It is not so much a background as in Florentine painting; the figures are not always in front of it but often in it. Giorgione made the greatest progress up to this time in landscape—luminous distance, luxuriant trees or bare trees patterned against the sky, the weather, the heat of a summer day or the cool of evening, the lightning flashes of a coming thunder storm. His portraits have a mood of reverie, his Arcadian idylls belong to some past golden age.

With Titian we reach the climax of the school. He was born a year before Giorgione and outlived him sixty-six years, dying in 1576, aged ninety-nine. At first he resembles his master Bellini, then Giorgione. But gradually his own personality asserts itself—he changes from the lyrical to the more dramatic style shown in the vigorous action and exuberance of his *Bacchus and Ariadne.* He is more complicated and powerful than Giorgione, more solid and real, and still more splendid in color. His range was vastly greater—he left a huge number of works of all kinds, portraits, altarpieces, nudes, classic myths and great decorations. He can be thoughtful and profound, as in the splendid *Entombment* of the Louvre; his portraits are often intense studies of character. His large altarpieces, although often grandiose, are always rich designs in line, light and color.

Tintoretto's style is quite different. There is no trace of calm and serenity. All is tremendous energy, movement and drama, due largely to the brilliant lighting of parts and their dramatic contrast with shadow and also to swirl of line. Tintoretto carries space further back than Raphael; he composes his lines and light in depth. He also uses his brush in a new way, with evident delight in the strokes as such.

Veronese, who came from Verona to Venice in 1528, painted enormous canvases of great decorative richness—usually very spectacular pictures with imposing architectural backgrounds giving the illusion of great space. He turns the *Last Supper* and the *Marriage at Cana* into contemporary Venetian banquets. He does not retain the Venetian glow but paints in cooler tones.

The Decadence in Italy. The decline of painting was not so rapid in Venice as elsewhere in Italy. Even in the seventeenth century Venice produced sound painters, and in the eighteenth had a brief but brilliant Renaissance of which Tiepolo was the greatest master. The decline everywhere began with the imitation and exaggeration by lesser men of the obvious traits of the great masters of their time: Michelangelo's muscles and twisted torsos, Raphael's "ideal" figures and grace of line, Correggio's light and shade. Correggio's influence was especially destructive. He was a north Italian painter who lived in the first half of the sixteenth century. In certain churches he actually painted away the architecture, giving an overpowering illusion of real figures soaring into clouds with hosts of angels. His light and shade, derived from Leonardo but carried further, lent itself to very sentimental and exaggerated treatment by his followers.

The Eclectics (meaning "choosers") tried to revive art by combining "the line of Angelo, the color of Titian and the grace of Raphael," but their ambition was not rewarded. There was one new movement in the sixteenth century in revolt from the artificiality of the Decadence—that of the Realists headed by Caravaggio of Naples, who painted murders, quarrels and the like, and used even for his religious paintings Neapolitan types of the day. These he painted with most striking effects of narrow

The Storm

By the Venetian master, Giorgione, painted at the beginning of the sixteenth century. The lightning and the coming rain show his new naturalism in landscape. In the Giovanelli Palace, Venice.

lights coming out of dense shadows, and with very limited color. His treatment of impressions of light was later to influence Rembrandt and Velasquez and thus be passed down to modern art.

MEDIEVAL PAINTING IN THE NORTH

By northern painting we mean chiefly that of England, France, Germany, the Netherlands and Spain. Not many mural and panel paintings of the period before the fifteenth century Renaissance have survived. But there are many paintings in illuminated manuscript books throughout the Middle Ages, and also considerable stained and painted glass of Gothic period, in which we can trace a continuous history of the period.

These manuscript books were the product of the monasteries, written and illuminated by the monks who civilized and Christianized the men of the north and preserved for them the remains of ancient culture. Some were copies of old Greek and Roman manuscripts but most of them were religious books: Bibles, lives of the saints, books of devotion, service books for the church. The paintings in them were a mixture of the native art of the north and the traditions brought from Rome and Byzantium.

Celtic Painting. The chief quality of native northern art was line movement. In Ireland and England this was most developed. Irish painting is entirely unrealistic, mostly ornament. Ribbons and spirals are elaborated with animal features; birds, dragons and serpents are stretched into patterns, their tongues and tails prolonged into ribbons interlaced and tied with wonderful dexterity. Human beings become purely geometrical animals very much like the kings and queens of playing cards. The unity lies in the continuous, rhythmic movement. The most important manuscripts preserved belong to the seventh century A.D.

Continental Painting. When Charles the Great restored the Roman Empire (800 A.D.) he wanted to make his court at Aix the home of all the ancient culture that had survived, and the center of a new culture that would radiate to all parts of his empire. To that end he gathered scholars and artists from Italy, England, Spain and wherever he could. The pictures in the magnificent volumes executed at his court show a curious mixture: Celtic ornament combined with classical and Byzantine, stiff Byzantine portraits of Evangelists in frames of architecture, or perhaps with a perspective background that hints at Hellenistic sources.

Away from Aix, especially at Reims, we find the old Hellenistic naturalism preserved. One important book, the *Utrecht Psalter* (ninth century), seems to be a translation into outline drawing of some old Hellenistic painting, but with a greater sweep of line and movement due to the northern temperament. It shows an immense number of small, restless figures in the most lively action, draperies fluttering wildly, in a spacious landscape that looks like windswept dunes.

The style of the *Utrecht Psalter* had an enlivening influence on painting after Charlemagne's time, and when it was imported into England in the tenth century, its rhythmic linear movement proved so agreeable to Anglo-Saxon artists that it became the favorite style for two centuries. And when England was brought into the fold of the continent by the Norman invasion of the eleventh century, the linear style returned to the continent and became the inspiration of Romanesque painting and sculpture in France.

Gothic Painting. For the arts, the twelfth and thirteenth centuries are periods glorious and unique. With architecture

Angel of the Annunciation

From the masterpiece of the Flemish painters, Hubert and Jan van Eyck, in the Cathedral of St. Bavon, Ghent. Finished in 1432. The angel, on the outside of the left wing, faces the Virgin who is on the right.

dominating, sculpture, painting, illumination, stained glass, tapestry, embroidery and all the allied crafts were joined in an amazing unity. The center is no longer the monastery; it is the town and the cathedral. The artists begin to be laymen instead of monks. Subject matter is no longer exclusively religious; manuscripts, for instance, include historical, literary and scientific subjects. As the cathedral rose to dizzy heights and the openings grew larger, painting was transferred from the walls to the glass of the windows. More splendid color has never been produced. The colors are luscious shades of rich reds and deep blues, yellows and greens in smaller quantity. The pieces of colored glass are very small, and when from a distance the difference between the colors is lost, the whole becomes a purple of wonderful richness. Details were painted in brown enamel on the colored glass and then fired, thus fusing enamel with the glass. The figures, always small in the early twelfth century glass, were used in a series of medallions, each one telling some sacred or legendary story. Thirteenth century glass was much the same except that some larger figures appear. In the fourteenth century large figures are everywhere, shadows and relief appear, as does a whole range of delicate half-tones. But the glory of the earlier centuries has vanished.

Thirteenth Century. For painting proper our chief source is still the manuscript. Books became small in this century and pictures delicate and minute. Books are resplendent with burnished gold and rich colors, especially blue and red, reflecting the brilliance of stained glass—black outlines even suggesting the leading of the glass. Backgrounds were commonly of gold, blue or red, with no suggestion of surroundings other than perhaps a tower or patterned tree. Later in the century the little figures became supple and delicate in body and feature, slightly modeled in color, and took on a certain gentle gayety—in form and spirit they resembled Gothic sculpture.

Fourteenth Century. Naturalism increases. Drawing becomes more flexible, lines are more flowing, the figure becomes elastic and swaying, the narrative more lively. Colors are still rich but more varied. Modeling creates an effect of third dimension. Backgrounds become elaborate with stippled gold and pattern. Occasionally they are broken to admit a bit of landscape or interior view. By the fifteenth century the formal background yields entirely and the figures take their place in natural surroundings, interior or landscape.

The subject matter has been broadening. In the late fourteenth and fifteenth centuries, literary and historical works increase and manuscript books of all sorts are made in great numbers, not only for churches and monasteries, but especially for the magnificent libraries of the great princes and nobles. In the fourteenth century we can trace the gradual changes that mark off English, French, Flemish, Dutch and Spanish manuscripts as the life of the different countries takes on distinct national character. In general we may say that illuminated manuscripts, with their rich imagination, incredibly fine craftsmanship, brilliant colors and lavish gold upon the silken texture of fine vellum, are among the most exquisite remains of the Middle Ages.

NORTHERN RENAISSANCE PAINTING

Paris was the great artistic and intellectual center of the fourteenth century, and a brilliant French Renaissance was about to unfold there when civil war and later disasters plunged France into misery. The Renaissance of northern painting took place in Burgundy at the hands of Flemish artists. In the fifteenth century the dukes of Burgundy had united under their peaceful and prosperous rule all the Netherlandish provinces. Netherlandish art flourished and even the manuscripts of the great French patrons were done by Flemish painters. (Flemish is a time-honored term for the art of the whole Netherlands until the seventeenth century when the term Dutch is used for the separated provinces—Holland—in the north.)

Panel paintings had been increasing in the fourteenth century, but the fifteenth was their real flowering period. Paintings were now made for the home, guild hall and town hall as well as for church and chapel. Religious feeling was still fervent but no longer dominated; art tended to become a record of

the splendor and great wealth of princely merchants and manufacturers.

Flemish, Fifteenth Century. The greatest Flemish painters were the brothers Hubert and Jan van Eyck, whose altarpiece at Ghent, *The Adoration of the Lamb*, was all —and more—to painting of the north that Masaccio's frescoes were to that of Italy. In this painting all the interests of the Flemish school are revealed. When the wings are opened the color has the blazing splendor of stained glass. Above, a great figure of God in jeweled robes is enthroned, with Mary (a Flemish Virgin, fair and blonde) and John beside him. On either side are singing and playing angels in rich brocades heavy with gold embroidery and with jewels. Beyond are naked figures of Adam and Eve shown in stark realism. Below is a Paradise of green with violets, cowslips, daisies, roses and purple flags; in the far distance are the towers of a city and snow-capped mountains against a blue sky. In the meadow, angels with rainbow wings surround the Lamb on the altar. Hosts of worshipers stand and kneel —popes and cardinals, poets and philosophers —while from either side hermit, pilgrim and warrior saints wind through a wooded country toward the scene of adoration. On the outside of the wings are portraits of the donor of the altarpiece and his wife, solid, weighty forms, full of character.

These were the qualities handed down to northern painting of the fifteenth century by Hubert and Jan van Eyck: brilliant color; a rugged realism; minute detail; delight in the texture of stuffs, of jewels, wood and stone; a tendency to angular line pattern instead of curves; an enthusiasm for portrait and landscape. Jan van Eyck's little portraits are powerful renderings of form and character, and unified in design in spite of their detail. Landscape was very spacious, with a high horizon giving what is often called "bird's-eye-view perspective" because the point of view is from a height. It was an assembled landscape in the sense that many bits studied from nature were put together in an imaginary whole.

The Van Eycks have been credited with the invention of oil painting. It was not oil painting in the modern sense but the use of an oil varnish mixed with the white or yolk of egg (or both) as a medium for the ground pigments. Probably the Van Eycks perfected this method and it became the traditional technique of the north just as was tempera in the south before the introduction of real oil painting in the sixteenth century.

A quite different personality was Roger van der Weyden whose home was in the southern part of the country and who was more like the French in temperament. His religious pictures express most intense emotion and are bound together by a rhythmic flow of line. Dirk Bouts of Haarlem contributed to the color and light of landscape; Hugo van der Goes made further contributions to realism in his study of light and everyday types of people.

Memlinc, who lived some fifty years after Jan van Eyck, put flesh upon the bony structures of the Van Eycks with his more delicate transitions of light and dark. He loses their powerful form, however; his figures have little weight or solidity—they are ethereal and other-worldly. His line is flowing and his design is beautifully patterned within the limits of a strict symmetry. On the panels of a little shrine he tells the story of the martyrdom of St. Ursula and her eleven thousand virgins in the spirit of a medieval fairy tale on a background of castles and the swelling sails of boats. He is never dramatic but he does impart a definite spiritual quality to his religious pictures even when he must introduce in the foreground careful portraits of the donor and his five sons and the donor's wife and her eleven daughters.

Mystic Marriage of St. Catherine

Painted in 1479 by the Flemish master, Memlinc. The child places the betrothal ring upon the finger of St. Catherine. St. Barbara is reading beside her tower. Beyond the figures of St. John the Baptist with his lamb and St. John the Evangelist with the poisoned cup are shown various scenes from their lives. In the Hospital of St. John at Bruges.

Flemish, Sixteenth Century. Quentin Matsys, transitional between the fifteenth and sixteenth century, played a rôle similar to that of Leonardo in Italy in his humanizing and dramatizing of the religious story, in his enthusiasm for light and dark and in his creation of form by softly modulated tones. Sometimes the genre element overwhelmed the religious sentiment, as in the case of a martyrdom of St. John in which the fiendish stokers are obviously of more interest to the painter than is the exalted saint in the caldron of boiling oil. The next step was to paint the genre subject for its own sake, and in this Matsys was the pioneer. Matsys has the splendid color of the earlier men with more variety, shimmer and sparkle.

Jerome Bosch and Pieter Bruegel were both from the Holland country. Bosch was the inventor of a world of nightmares and monstrous beings, a master of caricature and satire, always in the splendid color tradition of his school. From him descended Bruegel, humorist, satirist of the vices and foibles of humanity, but a painter of such broad interests that he could turn from the most involved allegory to the depiction of a village fair, a peasant dance, or a landscape more natural than any we have seen before. With Bruegel, landscape becomes truly local instead of an imaginary assemblage of bits. Often he lowers the horizon line so that his perspective is from the "normal" point of view. He is distinguished for his light and color and for his spatial pattern.

Bosch died early in the sixteenth century; Bruegel lived through the middle. Both men were the natural outgrowth of the Van Eyck tradition. But in the early years of the century there had developed a new and elaborate style which reflected the changing taste of the time. In this new painting there was an abundance of impossibly fanciful architecture, and saints and Virgin appeared in the latest fashions of the day. This extravagance was further complicated by Italian influence.

In the fifteenth century the Italians had been eager to learn the secrets of Flemish craftsmanship, but after the Italian Renaissance had culminated in the achievements of Leonardo, Michelangelo and Raphael, the

situation was quite different. Early in the sixteenth century the Flemings were fired with enthusiasm for Italian art, and there was a pilgrimage of artists to Italy with the most unfortunate results. They could not make their natures Italian, and the outcome was a strange mixture that sometimes reached the grotesque. They imitated the great compositional schemes of the Italians and especially their treatment of the nude; it became the height of ambition to be known as the Flemish Raphael. Probably the leading artists were Jan Gossaert and Van Orley.

No period is wholly decadent and there was some progress made, chiefly in greater breadth and freedom in representation. Pictures of contemporary life and the portrait flourished. Landscape became of more importance than the figure interest, thus pointing the way to the seventeenth century development of landscape for its own sake with no figure interest at all.

French Painting. In France in the fifteenth century there are few famous names. Certain anonymous paintings such as the great *Virgin of Pity* from Villeneuve, now in the Louvre, illustrates perfectly the French style with its northern realism modified by feeling for line, its emotion and masterly arrangement. Ever since Simone Martini went to Avignon during the exile of the popes there had lingered a Sienese influence very agreeable to the French temperament. This, in the course of the fifteenth century, yielded to realistic Flemish influence as shown in the work of Nicholas Froment. Jean Fouquet is the greatest name of the century, a painter of simple and direct portraits and also of miniatures in manuscripts, some of which give intimate pictures of his country and his time.

In the sixteenth century France, like Flanders, was in the grip of Italianism. Italian artists were even brought to the court to cover palace walls with paintings in the southern manner. But unlike Flanders, France was able to adopt Italian tradition and to build upon it a new style. Pictures of allegory and mythology with many nude figures grew common, but at the same time there was an intense enthusiasm for portraits. Jean Clouet, of Flemish origin, and his two sons, François and Corneille, were the most famous of the portrait painters. Their portraits are light, delicate, with few colors and few lines, but they express the personalities of the aristocracy of the time with great vitality.

German, Fifteenth Century. In the fourteenth century a school of painting had emerged from manuscript illumination, supposedly under the leadership of one Master Wilhelm of Cologne. The style of this school was not expressive of ceremony but rather of private devotion. There were small Madonna pictures for private oratories, and Paradise pictures with Virgin and Child surrounded by saints in a medieval garden.

In 1430, Stephen Lochner, a stranger from Swabia, came to Cologne and became the leading master of the school. Lochner quite lacked the force and grandeur of the Van Eycks—he is simple and human with no trace of the austere realism of the Flemings. The Virgin sits in a garden, eyes lowered, smiling and ecstatic, holding the Child; small angels gather around her in clear tones of red, blue, green and rose. Flesh tones are luminous and the bright colors have a soft modulation.

As the century advanced the religious story took on the flavor of everyday life; painting deserted the mystic garden and told new stories in the spirit of naturalistic observation. After 1450 Flemish influences, especially of Bouts and van der Weyden, turned the school from fourteenth century idealism and fondness for line to realism and modeling in light and dark.

From about 1480 Flemish influence, especially that of van der Weyden, came to predominate in the south also. The most influential painter of this epoch was Martin Schongauer. In general the German schools may be distinguished from the Flemish by their harsher and heavier color, their angularities of gesture and attitude and their more crowded and less organized designs.

German, Sixteenth Century. In the sixteenth century came the same Italianism that had overwhelmed the other countries. But several great artists learned from Italy and still maintained their German spirit. Chief of these was Dürer. He was the learned artist of the time, curious, theoretical. He worked for a time in Italy, and developed

Anne of Cleves
By Holbein, German painter of the sixteenth century. The fourth wife of Henry VIII, in crimson velvet and gold against a ground of peacock blue. In the Louvre, Paris.

from the Venetians an absorbing interest in light. In spite of an incredible amount of detail his compositions are held together by their lighting which is emotionally expressive —somber gloom, unearthly glitter, soft sunshine. He adopted Italian schemes of design and absorbed all of Italian progress in representation. He tried to carry his expression even to the point of symbolizing abstract ideas. He advanced from a very complicated style to the simple broad unity of his last powerful work, the *Four Apostles*.

Two generations of artists continued more or less in Dürer's manner. Grünewald stands out as a great original colorist and master of emotional expression. His colors and his distorted forms can be agitating and harrowing, tragic and ecstatic. Grünewald as well as Dürer very strongly influenced Altdorfer, who is known for his color and light and for his landscape.

Hans Holbein, who was born and who died some twenty years after Dürer, fell early under Italian influence and was occupied with picturesque effects of strange and violent lighting, vast shadows and flickering lights. Then he went to England as court painter and became almost like a fifteenth century Fleming in his amazing realism, and with few exceptions painted portraits for the remainder of his life. He depicts not only the bodies but also the minds of his subjects. And he is never the mere recorder of facts; always he is emphasizing or reducing, enhancing a line or gradating a color, so that in the end his form seems quite perfect and unchangeable.

THE SEVENTEENTH CENTURY

In this century we find certain changes that contain all the germs of modern art. Interest in landscape led to a great interest in space. Tintoretto had carried his figures back into space; but beyond the figures space tended to flatten down and lose reality. Certain painters of the seventeenth century carried their realization of depth even to the horizon. Space stretched out as never before, not in parallel planes as was usual with Renaissance painters, but through great diagonals or curves that led attention in and out of the picture space. Space existed between objects. Design was no longer a matter of the surface, in relation to the rectangle of the picture, but moved in and out of depth.

At the same time an absorbing interest in light and color tended to break down expression of space and volume in favor of a mosaic of light and color that anticipated the nineteenth century impressionists.

Flemish Painting. With the giant Rubens a new golden age of Flemish painting emerged from the sixteenth century decline. Rubens, born in 1577, about the time of Titian's death, went to Italy and was able to assimilate Italian ideals without damage to his Flemish traditions, and to pass on to later centuries the elements of both. He has Venetian feeling for color masses, with Florentine sense of form and expressive line; but Venetian glow becomes reddish with Rubens, the strong modeling of Michelangelo is softened, line grows atmospheric and turns to shorter curves and double curves, Venetian composition becomes more florid.

Whether he painted myths, battles, animals, markets, peasant fêtes, altarpieces, landscapes, portraits, still-life—everything is in movement; if it is not a drama of human beings in movement, it is a drama of moving color, light and dark, and line. One has the impression of a great energy in continual transformation, but of a controlled and ordered energy, for Rubens is a great designer —a designer in space—even to the smallest unit of his great canvases. His chief followers were Jordaens and Van Dyck; and after them came the Flemish decadence.

Dutch Painting. In the seventeenth century the southern part of the Netherlands, modern Belgium, was still Catholic and was under the rule of Spain; but the northern Netherlands, modern Holland, had become Protestant and independent. There were no palaces for which the Dutch could paint, and no churches, because Protestantism disapproved of the decoration of churches.

A Canon of the Church
Painted in the early sixteenth century by the Flemish master Quentin Matsys. In the Liechtenstein Gallery, Vienna.

Instead they painted for the private house, the town hall, the homes of the various guilds and institutions. There was great enthusiasm for paintings of everything that had to do with their own people and their own country, now especially dear to them in their new and hard-won independence. Artists began to specialize as painters of portraits, of landscapes, of genre.

Frans Hals, next to Rembrandt, was the greatest of the portrait painters. He has left us a panorama of the Dutch people, the merchants and their wives, the archers of the civic guard, directors of the poorhouse, a laughing servant, a jolly toper, an old witch with her owl. He is known for his expression of life, due partly to catching his subject in a lively mood, partly to his vigorous and dashing brush strokes.

Rembrandt, the greatest genius of the Dutch school, painted not only portraits but scenes of everyday life, landscapes, still-life and a vast number of religious subjects. These were not monumental paintings for the church but stories of the Old Testament, told with splendor of imagination and with feeling for the ancient East, and pictures of the New Testament in the simple spirit of the Gospels. He treats of all ages, all emotions and all conditions of people. Most of his early paintings were executed with a sober realism and attention to form in minute detail. But in 1642, in his *Sortie of the Civic Guard*, he allowed himself, in his passion for light and dark, to forget the careful representation of form so dear to the Dutch heart. Only a few figures emerge clearly from the moving light and shadow—and the result was his immediate decline in popularity. Rembrandt's light is not natural but a light that is all his own, with which he brings volumes from the shadows into golden light and then lets them retreat again into gloom. Sometimes his fascination with light so dominated that his lights and darks mass into patterns that quite destroy form and foretell the complete visual impressionism of the nineteenth century.

The Dutch of the seventeenth century gave genre painting a distinct character. Their works are small, minute in technique, splendid in craftsmanship; placid little pictures that repeat over and over again favorite themes of peasant life, such as the fête, dance or market, or scenes from the home life of the rich burghers, as the music lesson and card party. The story is of little importance; the real concern is with color, texture and the decorative whole. The chief men were Ter Borch, Steen, Vermeer and De Hooch. The last two were fascinated with natural light, air filled space, effects of sunlight. Vermeer could show the most delicate differences in value (amount of light) of every spot of color.

Of the Dutch landscapists, Hobbema and Ruisdael were the greatest. Ruisdael studied the forms of trees and their manner of growth, the solid ground and vastness of the sky; his clouds have bulk and carrying power. Sometimes it is the country around his native Haarlem; again, with romantic imagination, he treats of strange rocks and hills and waterfalls.

Realism did not extend to color; Dutch landscape, with few exceptions, transposed the colors of nature into a scheme of browns and brown-greens, sparingly enlivened with blue and red.

French Painting. Italianism was less disastrous to France than to other countries. It continued even into the seventeenth century with happy results in the work of Poussin and Claude Lorrain. Poussin admired Raphael and ancient sculpture, and his work shows the spirit of the Italian Renaissance through French eyes. His sculptural figures are tied together in varied and rhythmical arrangements. His favorite subjects were stories of classical antiquity against a background of landscape carefully studied for its clouds, tree forms and the solid structure of the ground. When landscape was his chief interest he carried his design into deep space.

Claude Lorrain was primarily a landscape painter, although he always introduced some small and unimportant figure interest, biblical or classical. His special contribution lay in light and atmosphere. His landscapes are romantic, majestic, with great tree masses placed against a vast and mist-filled distance. Color is secondary, being submerged in a warm or silvery light enveloping the whole. Because of his fondness for introducing classical architecture he is often called "the father of classical landscape." It is an assembled landscape, built on the study of nature but entirely imaginary in its final form.

Spanish Painting. The history of Spanish painting during the Renaissance is largely one of foreign influences, but of influences that immediately took on a Spanish character. They were Flemish in the fifteenth century—Jan van Eyck visited Spain—and Italian in the sixteenth. A distinguishing feature of Spanish style in the fifteenth century was the primitive fondness for gold backgrounds—plaster relief covered with gold. The Eclectic Italians dominated the sixteenth century with their twisted torsos, exaggerated muscles, striking darks and lights.

In the late sixteenth century there came to Spain a foreign painter, Domenico Theotocopuli. He came from Crete and was popularly called El Greco (The Greek). He had studied Titian and knew the works of Michelangelo. In Spain his warm Venetian colors cooled, became dulled with black, and his whites became silvery. More than any other painter he expresses the religious emotion of the Spanish temperament. He is unique in the restless, flame-like rising of his forms, the flickering lights, the elongated, undulating bodies that he does not hesitate to bend at will for the sake of his emotion and design.

El Greco worked into the seventeenth century. Quite unlike him were the Realists, Zurbaran and Velasquez, who lived some fifty years later. Velasquez began as the accomplished student of all the traditions of his time. Later in his life he became court painter of Philip IV of Spain, and in the long series of portraits of the king and queen, the infantas, dwarfs and the whole nobility of the Spanish court, he revealed himself

Don Balthasar Carlos

in a new and individual manner. In the cool, diffused light of the Spanish palace there were no strong shadows to throw forms into relief; instead they tended to appear as color masses of various degrees of light. Velasquez became engrossed with purely visual impressions. So sensitive was he to the exact relations of values that at times he produced an uncanny illusion of space; but he

did it solely with his color and not with line or shadow. He was never a mere reproducer of nature's light and color, but always achieved a decorative unity by arranging his masses of color and light in finely balanced patterns. He grew fond of low-toned colors, casting aside the warm glow of the Italians for cool subtleties of blacks and whites and silver grays, with notes of rose red, blue and yellow. Velasquez was the chief influence on modern Impressionism.

THE EIGHTEENTH CENTURY

English. Painting was still on its downward slope in Italy and in Germany; Holland and Flanders, after the brilliant seventeenth century, had not a single great name. In England and France however, there was an art founded on that of Rubens. England had not developed a national school since the Middle Ages. In the sixteenth century she had imported Holbein from Germany as court painter; in the seventeenth, Van Dyck from Flanders. The first English painter was Hogarth, a portraitist and story-telling painter who satirized the social life of his day—as in *Marriage à la mode.*

About the middle of the century, chiefly under the influence of Rubens and Van Dyck and of the Venetians, there grew up a school of English portrait painters with Reynolds and Gainsborough as leading masters. Compared with the older masters whose secrets they sought to recapture, they have only surface charm; but their portraits of Garrick, Mrs. Siddons, Dr. Johnson and of the whole English aristocracy are a valuable record of the artificial elegance of the England of their day. Reynolds' form and design were better than Gainsborough's; but the latter had his own charm of light and texture and of vivacity and movement, with an undercurrent of romantic melancholy. The school ended with brilliant but shallow painting early in the nineteenth century.

French. The master who brought into France the color, light and movement of Rubens and of the Venetians was Watteau. He painted fairy-like fêtes of lovers in romantic landscapes and the Harlequins, Columbines and other actors of French and Italian comedy. He is slight as compared with Rubens, light and vivacious; but within his scope he is a master. His delicately modulated light and dark moves rhythmically in and out of space, his color breaks into jewel-like and iridescent bits. His fairyland art degenerated in the hands of his followers into shallow and frivolous imitation.

The ingenious decoration of salon walls and ceilings with make-believe shepherdesses, dairymaids and classical divinities had a special vogue in the eighteenth century. Painters like Boucher tried to merge the classical art of Poussin with the tradition of Rubens with resulting weakness but decorative charm. Fragonard was more successful. Nattier was the painter of many portraits, artificial but decorative, of the French aristocracy posing as classical divinities.

The Hay Wain
Painted in 1821 by the English landscapist, Constable. Exhibited at the Paris Salon of 1824, it became an important influence on French painting. In the National Gallery, London.

Chardin, next to Watteau, was the finest painter of the century. He was a genre painter who turned the most trivial subjects into poetry. He painted his wife and children, their kitchen, the vegetables, meats, pots and pans, and achieved a triumph in texture, color and design.

About the middle of the eighteenth century came the first important discoveries among the ruins of Pompeii and Herculaneum. French taste of the day turned to the classical subject. Louis David inaugurated a classical movement in painting which successfully put an end to the frivolities of the salon decorators but at the same time destroyed the whole tradition of northern art. David succeeded in imposing his style upon almost the whole of Europe—the classical subject, figures like marble statues in their clear cut contours and hard texture, flat tones of lifeless color, statuesque rigidity instead of movement.

Spanish. Goya, who like David lived through the first quarter of the nineteenth century, stands out in vivid contrast. His style descended from Velasquez, and he likewise was a painter of the Spanish court. He is distinguished for his character portrayal, his fine patterns of light and dark and his delicate color harmonies. In another aspect, in his illustration and satire of the corruptions and weaknesses of his day, he suggests the Flemish Bosch and Bruegel.

THE NINETEENTH CENTURY

Classical Movement. David's classical art proved to be only a curious break in the chain of tradition. Ingres, his greatest follower, also subordinated color to line; but his classical works had much more life, and there was movement and vitality in his linear patterns. Prud'hon was even romantic in his veiling of classical forms and his emotional use of light and dark.

French Romanticism. Classical art could not hope to express the emotion and passion for liberty let loose by the French Revolution. Swift on the heels of Classicism came the Romantic movement—life and color, play of light and shadow, the atmospheric edge, emotional expression, movement, the tradition of Rubens reinstated. Subject matter changed to heroic events of the day or, in reaction against the classical subject, to the medieval story—the Crusades, tales from Dante, Shakespeare or Byron. Delacroix was the leader. His special contribution lay in color which he used to express emotion and to contribute to the drama of the situation. Sometimes he let color dominate so that we see his pictures as a pattern of color masses before we can distinguish what the patches of color represent. In this he anticipated Impressionism.

Naturalism in England. Revolt against the idea that only subjects strange or remote in time or place were suitable for painting brought about a new naturalism—painters insisted upon expressing their fresh impressions of the world about them. This is sometimes called a new aspect of romanticism because of the emotional attitude toward nature. The greatest impetus came from England in the work of Constable who painted intimate scenes of his own England with the same love that the Dutch had lavished on the Holland country. He dared to cast away their green-brown scheme of color and paint nature's greens, making them more vital by painting what he called a "multitude of greens" in separate strokes instead of mixing them upon the palette. Constable painted only in the English summer but he caught its exact character, its breezes, heat and heavy coloring, storms, rainbows and sudden sunshine.

Constable is a great contrast to his contemporary, Turner, who painted landscapes in the tradition of Claude Lorrain—vast, majestic, artificial, but with great luminosity and brilliance of color. His technique for achieving this was like Constable's, placing spots of color side by side for the eye to mix.

The Barbizon School. Paintings by

Constable shown at the Paris Salon in 1824 stimulated Delacroix to further study of color, and inspired a little group of revolutionary spirits who were founding a new school of French landscape painting. Rousseau settled in the little village of Barbizon on the edge of the Forest of Fontainebleau and began to paint intimate scenes of the French countryside. The permanence and strength of nature appealed to Rousseau; he built up the solid structure of his trees and placed them against a blue sky or flaming sunset. Daubigny, Diaz and Dupré were also at work in the forest—all different personalities but filled with the same sincere desire to express their vision of the world about them.

Millet added to the new landscape, and, in the same spirit, the human figure. He had a great reverence for Poussin and Michelangelo, and this appears in his simple paintings of the French peasant when he seizes just the essential lines to indicate a movement or to create the solid volume of a figure against a far-reaching plain.

Corot never lived at Barbizon but he was allied in spirit to the group. His art was descended directly from Claude and Poussin. He introduced small classical figures into his landscapes and like Poussin created arabesques of line and mass. He was especially the painter of morning light, of the cool blue-green of foliage, of vanishing distance half-hidden by mist. He was even more important as a figure painter although less known as such. Corot as well as Rousseau and his group express the form of things in their

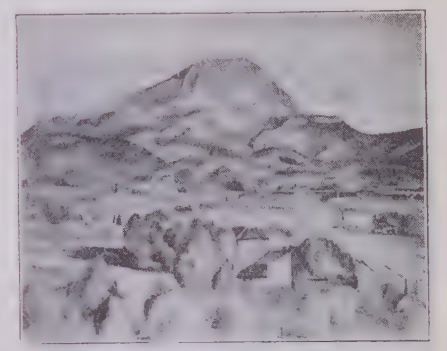
Girls at Piano
Painted in 1892 by Renoir, French Impressionist. In the Luxembourg Museum, Paris.

early work. Later, having become interested in color and light, they tend to see the world as a mosaic of color patches and, like Delacroix, anticipate the Impressionists.

Realism. It was not Millet but a more fighting personality, Courbet, who came to Paris in 1839 and succeeded in putting to rout the historic-romantic subject. He painted such subjects as a *Funeral at Ornans* and the *Stonebreakers*, and many landscapes and marines of great vigor and breadth and fine design.

Courbet was inspired by the old Spanish masters. Daumier, who was also important in the cause of realism, was descended from Michelangelo, Rembrandt and Bosch. He painted in rich, somber color, giving only the essential volumes of his figures and binding them into strong spatial designs. Expressive line is important in the part of his work devoted to satire and character studies.

Impressionism. Courbet had painted his out-of-door figures with the colors and shadows of the studio. Manet, who had discovered Velasquez, wanted to show the natural subject in natural light. Unlike Velasquez, his interest in light became so absorbing that he lost to a large extent his interest in form; and both his figures and background tended to become flat color masses. These he simplified so that they appeared to have almost no modeling and bound them into a decorative whole.



Light, as Manet once said, became the principal person in the picture. But Manet never went so far as his landscapist friends, Monet and Pissarro, who dissolved all form into atmosphere and broke up Manet's simple color masses into a wealth of changing hues. About 1870, Monet and Pissarro, in their desire to add to Manet's light the brilliance of out-of-door color, adopted a special technique of broken or divided color, based on the fact that a blue and red, for instance, placed side by side on the canvas, will produce a more luminous and brilliant violet than when mixed upon the palette. The stained glass painters of the twelfth century had understood this; so, to some extent, had Watteau, Constable and Turner. But the color impressionists made a scientific study of this technique; its possibilities stimulated new observation of nature and suddenly a whole new world of color was revealed, not the rich jewel-like gleam of the Flemish and Venetians, but splendid in quite another way, in the shimmer, glitter and radiance of the light and atmosphere of out-of-doors.

Impressionism took the final step in freedom of subject matter for when light and color became the chief interests no subject was too commonplace to interest the painter.

Post-Impressionism. The great Impressionists always designed, some of them, like Manet, Degas and Whistler, creating novel patterns in line and color under the influence of Japanese prints. But there was a general tendency merely to imitate the momentary appearance of some fragment of nature in some particular light.

The movement against Impressionism had two aspects, first a desire to recover for painting the interests that the Impressionists had lost, especially volume; second, a conscious endeavor to design. The new movement arose within the ranks of the Impressionists themselves. Renoir, one of the greatest of the group, became interested in volume and solidity and in his last work actually threw away his wealth of color, adopting a reddish monochrome because it helped his line create voluminous forms arranged in rhythmic movement back and forth in space. Seurat, although he carried the scientific study of color much further than the Impressionists, used his color technique not to record his fleeting color vision but to build up fine design.

But the real father of Post-Impressionism was Cézanne, who wanted to make something solid of Impressionism. He wanted volume and space as well as color. He began to use color to intensify his form, painting not the accidental patches of light and dark and color

Mont Saint Victoire
By the French Post-Impressionist, Cézanne. The rhythms of line, light, color and volume carry the eye through every part of the landscape. In the Barnes Foundation, Merion, Pa.

that destroy form, but studying the way in which hues change as they advance into light and recede into gloom and using such advancing and receding colors to help build up his forms. Volume in itself has no artistic merit but Cézanne's paintings, whether of apples and dishes on his kitchen table or of the far reaching plains and distant mountains of his home in southern France, have their volumes composed, ordered in some fine relation.

THE TWENTIETH CENTURY

The reaction against Impressionism began in the eighties but did not acquire momentum until the late years of the nineteenth century; from the time of Cézanne's death in 1906 it became a very definite movement. Cézanne was the most influential of all the Post-Impressionists. The term is very inclusive for the men who belong to the era "After Impressionism" are quite different in their interests. They are held together only by certain broad qualities such as these: a desire to express any impressions or ideas except the color and light mosaic of the Impressionists; a tendency on the part of many artists to express volume and solidity, and of others to paint in sober color, because this was the opposite of Impressionism; a greater simplicity for the sake of better emotional expression; a comparative indifference to subject matter because they believed that the real value of a painting lay in the organization of its color and form.

The frequent distortions of modern art are due to the fact that in the reaction against Impressionism the appearance of things to the eye had become of no importance, so that painters distorted at will in order to express better their ideas or emotions, or in the interest of better design.

Thus Cézanne altered color and light to achieve effects of form and space, or distorted his dynamic lines to create a new balance. Gauguin, in his idylls of Tahiti and the South

Seas, freely used his color and line in the cause of emotion and design. Van Gogh, the Hollander, used quite unreal color for its emotional value and carried his desire for emotional expression even into the use of his brush—the strokes of pure color being drawn into writhing forms that give not only a sense of life and motion in the world depicted but express directly the artist's own emotional excitement. Matisse was the leader of a group that made a still further

Nude Descending Stairs
Cubist painting by the French artist, Marcel Duchamp.

departure from visual appearance in the interest of such "expressionism."

Cubism. Cézanne, being interested in form, once said that nature could be expressed with the cube, cone and cylinder. Thereupon the Cubists—Picasso and Braque were the driving spirits—undertook to reduce nature to those geometrical essentials. Later in an effort to escape farther from the limitations of appearance to the eye, they substituted for the single aspect of an object the many aspects that might be preserved in the memory. These were arranged together, intersecting, or superimposed. Gradually emphasis on design turned Cubism into flat pattern although a few men continued to make their designs in space—in the very shallow space that is possible when dealing with cones and cylinders instead of spacious landscape.

There was a great development of other cults just before and after the World War. Germany, especially Munich, came to the fore as a new center. In general there seems now to be a tendency away from the more extreme forms of modernism toward those in closer touch with tradition. The intentions of modern painters are very diverse, but one desire at least seems to bind them together—a highly conscious effort toward creative design.

PAINTING IN THE UNITED STATES

Ever since the early nineteenth century Paris has been the clearing house for the painters of all Europe. Even ideas that came from other countries, notably England, matured there. There were always individuals who were not allied with any group, but in general we can trace in all European countries a development corresponding to the broad movements of modern French painting, and usually under direct French influence. This was true also of America.

Colonial Painting. In America the Colonial painting of the eighteenth century was really a branch of the English school. The leading portraitists, Copley and Stuart, spent years of their lives in England. Benjamin West left America in 1763 to settle in London and became the master of most of the American painters who came to London for instruction, such as Trumbull, the historical painter, and Sully, who continued the tradition of the English portrait school past the middle of the nineteenth century.

Nineteenth Century. When the influence of England declined after the first quarter of the nineteenth century painters turned to Düsseldorf, Munich, and finally Paris for their training. At the same time there was a native development in landscape known as the Hudson River School (Cole, Durand, Church). The accomplishment of these painters was not great but inspired by a new national enthusiasm for their surroundings they laid the foundation for the landscape development that has become a distinguishing feature of painting in the United States.

Of the next generation of landscapists, which was on quite a different level, the most important were Homer Martin, Wyant and George Inness. They correspond to the Barbizon group in France. The landscapes of Inness are distinguished for their harmony of color and mass and their emotional expression of nature's moods. His contemporary, John La Farge, was a painter of wide range, including large murals of religious subjects. Through wide travel he became familiar with Oriental as well as European traditions and played an important part in American painting through his influence as well as achievement. His emotional use of color suggests Delacroix and his technique, the Impressionists. He carried his color experiments also into the field of stained glass.

Realism and Impressionism. Winslow Homer, a powerful painter of the sea and the Maine coast, might be called the American Courbet. Thomas Eakins, the portrait painter, belongs also to the realistic movement. As in France there were always artists who worked apart from the general tendency, such as the visionary romanticist, Albert Ryder, the sensitive George Fuller, and, later, the poetic Arthur B. Davies.

The chief exponent of early Impressionism was Whistler who is also claimed by the British because he made London his permanent home. He was formed chiefly under the influence of Velasquez, the Japanese and of his friends, the Impressionists. Design was his chief motive—subtle patterning of line and tone and color. Even the meaningful portrait of his mother he calls *Arrangement in Grey and Black.*

Sargent also made London his permanent residence. He belongs to the Velasquez tradition but goes to the extreme in sacrificing form and often design to an accurate record of impressions of light. His brush work is very brilliant and stirring. Mary Cassatt, the painter of a long series of mother and child pictures, lived for the most part in Paris and was a follower of Degas. Corresponding to the color Impressionists are J. Alden Weir, Twachtman, Childe Hassam, Ernest Lawson, Glackens and Prendergast. Robert Henri belongs to the Manet tradition.

In the period of Post-Impressionism there was far more conservatism in the United States than in Europe. There were exponents of Cubism, Futurism and other ventures, but on the whole the painters who outlived Impressionism, such as George Bellows, Sloan, Kroll, Speicher, Henry McSee, are as firmly linked with the tradition of the old masters as with the new ideas of their age.

The Fog Warning
Painted in 1885 by the American artist, Winslow Homer. In the Museum of Fine Arts, Boston.

GREAT PAINTERS

	Italy			Netherlands	Germany	France
	Florentine	Sienese				
Thirteenth and Fourteenth Centuries	**Cimabue** ca.* 1240-1301 **Pietro Cavallini** (Rome) 1250-1330 **Giotto** 1276-1336 **Taddeo Gaddi** ca. 1300-1366 **Andrea Orcagna** 1308?-1368 **Spinello Aretino** ca. 1330-1410	**Guido da Siena** 13th century **Duccio di Buoninsegna** ca. 1260-1319 **Simone Martini** ca. 1285-1344 **Pietro Lorenzetti** active 1305-1348 **Ambrogio Lorenzetti** active 1323-1346?			**Wilhelm of Cologne** active ca. 1358-1378	**Jean d'Orleans** 1305-1408 **André Beauneveu** active 1360-1390 **Jacquemart de Hesdin** active 1384-1400
	Florentine	Umbrian	Venetian and North Italian			
Fifteenth Century	**Masolino** ca. 1384-ca. 1440 **Masaccio** 1401-1428 **Fra Angelico** 1387-1455 **Andrea del Castagno** ca. 1397-1457 **Paolo Uccello** 1397-1475 **Fra Filippo Lippi** 1406?-1469 **Benozzo Gozzoli** 1420-1498 **Baldovinetti** 1425-1499 **Antonio Pollajuolo** 1429-1498 **Andrea Verrocchio** 1435-1488 **Sandro Botticelli** 1447?-1510 **Domenico Ghirlandajo** 1449-1494 **Leonardo da Vinci** 1452-1519 **Filippino Lippi** 1457-1504 **Lorenzo di Credi** 1459-1537	**Gentile da Fabriano** 1360-1427 **Sassetta** (Siena) 1392-1450 **Giovanni da Paola** (Siena) ca. 1403-1483 **Piero della Francesca** 1416?-1492 **Melozzo da Forlì** 1438-1494 **Luca Signorelli** 1441-1523 **Pietro Perugino** 1446-1523 **Pinturicchio** 1454-1513	**Squarcione** (Padua) 1394-1474 **Jacopo Bellini** active 1430-1470 **Antonio Vivarini** active ca. 1440-1470 **Antonella da Messina** 1430-1479 **Cosimo Tura** (Ferrara) 1430-1495 **Gentile Bellini** 1429-1507 **Giovanni Bellini** ca. 1430-1516 **Bartolommeo Vivarini** ca. 1431-1499 **Mantegna** (Padua) 1431-1506 **Carlo Crivelli** ca. 1450-ca. 1493 **Francia** (Bologna) 1450?-1517 **Cima da Conegliano** ca. 1460-1517	**Limbourg Brothers** 15th century **Hubert van Eyck** 1370?-1426 **Jan van Eyck** 1390?-1441 **Robert Campin** 1378-1444 **Jacques Daret** active 1427-1468 **Roger van der Weyden** 1400-1464 **Dirk Bouts** (Dutch) ca. 1400-1475 **Peter Christus** ca. 1410-1473 **Aelbert van Ouwater** (Dutch) active ca. 1450-ca. 1480 **Hans Memlinc** ca. 1430-1494 **Hugo van der Goes** 1435?-1482 **Justus van Ghent** active 1460-1480 **Jerome Bosch** ca. 1460-1516 **Gerard David** ca. 1460-1523 **Geertgen Tot Sint Jans** (Dutch) ca.-1465-ca. 1493 **Quentin Matsys** 1466?-1530	**Stephen Lochner** active 1430-1451 **Michael Wolgemut** 1434-1519 **Martin Schongauer** ca. 1445-1491 **Bartholomäus Zeitblom** 1450-1518 **Master of Life of Mary** active 1460-1490	**Engerrand Charonton** 15th century **Henri Bellechose** active ca. 1415-1440 **Jean Fouquet** 1415-ca. 1485 **Jean Bourdichon** 15th century **Nicolas Froment** active 1476 **Master of Moulins** active 1480-1500

FAMOUS PAINTINGS IN IMPORTANT GALLERIES

I. In the Rijks Museum, Amsterdam

Title of the Painting	Painter	School	Comments
The Pantry	Peter de Hooch (1629–1677)	Dutch	A study of light and space. The rectilinear pattern is characteristic of Dutch art.
William of Orange and Mary Stuart	Van Dyck (1599–1641)	Flemish	The betrothal of William of Orange and Mary Stuart executed by the artist when he was painter at the Court of England.
The Mill	Jacob Ruisdael (1628–1682)	Dutch	The fine cloud structure and dramatic play of light and dark are characteristic of the artist.
Woman Reading a Letter	Vermeer of Delft (1632–1675)	Dutch	Masterly in values of light, balance of spaces and harmony of color.
Sortie of the Civic Guard	Rembrandt (1606–1669)	Dutch	This picture, much darkened and miscalled the "Night Watch," cost Rembrandt his popularity because he presented the members of this hooting company not as sober portraits but as objects for the rich play of shifting light and shade.
Syndics of the Cloth Guild			A triumph of his last years in which he holds in one unified impression six powerful and individual portraits.
Madonna and Child	Fra Angelico (1387–1455)	Florentine	The gold brocaded curtain and the pattern suggest the tradition of the illuminated manuscripts.

II. In the Royal Museum, Antwerp

Entombment	Quentin Matsys (1466–1530)	Flemish	Ordered in 1508 by the Antwerp Joiners' Guild. Shows innovations in the realism of the types and the brilliance and diversity of color.
The Seven Sacraments	Roger van der Weyden (1400–1464)	Flemish	Blends daily life of the people with medieval mysticism. The great cross appears supernatural in size and awe inspiring because it fills the high nave of a Gothic church.
The Mandolin Player	Ter Borch (1611–1681)	Dutch	A typical subject by Ter Borch who painted intimate home life of the Dutch aristocracy of his day.
The Dauphin of France	François Clouet (1505–1572)	French	Son of Francis I. Every stroke of the brush counts in the simple, vivid characterizations of the Clouets.
Saskia	Rembrandt (1606–1669)	Dutch	Portrait of the wife of Rembrandt, painted in one of the many elaborate costumes he himself had designed.

FAMOUS PAINTINGS IN IMPORTANT GALLERIES—Continued

II. In the Royal Museum, Antwerp—Continued

Title of the Painting	Painter	School	Comments
St. Barbara	Jan van Eyck (1390–1441)	Flemish	An unfinished panel revealing the method of painting in the fifteenth century; pigment used as a glaze after the picture had been completely drawn and modeled in monotone.
Adoration of the Magi	Rubens (1577–1640)	Flemish	The first work of his third period when his light and color reached the same height as his dramatic quality.
The Crucifixion			Known also as *Le Coup de Lance*. The calm majesty of the Christ is well contrasted with the violence of the two thieves.
Christ and Angel Musicians	Memlinc (ca. 1430–1494)	Flemish	Painted for the decoration of an organ in a church in Spain; figures, over life-size, stand out in soft, light tones against a gold background with clouds above and below them.

III. In the Kaiser Friedrich Museum, Berlin

Hieronymus Holzschuer	Dürer (1471–1528)	German	A powerful characterization of one of Dürer's friends, a man of impressive personality.
Madonna of the Goldfinch			Painted while Dürer was in Venice and showing the influence of Venetian light and color.
Portrait of a Lady			Lady against the sea. Executed in Italy with Leonardesque breadth of light and shadow.
The Pearl Necklace	Vermeer of Delft (1632–1675)	Dutch	A splendid relation of tones and of color—blue and old gold against a gray ground vibrant with light.
Altar of John the Baptist	Roger van der Weyden (1400–1464)	Flemish	A very small altarpiece showing the Baptism of Christ in the center, the Nativity on one wing and the Beheading of John the Baptist on the other.
Adoration of the Christ Child	Fra Filippo Lippi (1406–1469)	Florentine	Against a decorative background of rocks and dense fir trees, the Virgin adores the Child; above them, the Dove and the protecting Almighty.
The Concert	Ter Borch (1611–1681)	Dutch	An example of the perfect craftsmanship of the Dutch Little Masters. The textures and the coral color against the cool notes of the room are splendidly rendered.
The Prophet Elijah	Dirk Bouts (ca. 1400–1475)	Dutch	Shows the jewel-like color, the calm stiff figures and the angular pattern so characteristic of the artist; also his important innovations in landscape.
Man with the Pink	Jan van Eyck (1390–1441)	Flemish	Powerful and uncompromising realism in depiction of age and character.
St. John of Patmos	Geertgen (1465–1493)	Dutch	Brooding figure of St. John in a spacious and decorative landscape.
Madonna and Child	Quentin Matsys (1466–1530)	Flemish	Matsys changes the exalted Virgin into a very human mother kissing her child.
Etienne Chevalier and St. Stephen	Jean Clouet (1475–1540)	French	Portrait of the King's treasurer and his patron saint.
Hille Bobbe	Frans Hals (ca. 1580–1666)	Dutch	The rollicking soothsayer of Haarlem painted in the loose, bold brush strokes that contributed to the vitality of Hals' style.
Nurse and Child			Another aspect of his style showing a more minute technique in rendering flesh and texture but with no sacrifice of lifelike quality.
Portrait of Two Canons	Antonio Moro (1519–1576)	Flemish	Two impressively truthful portraits by one of the most illustrious Netherlandish portrait painters of the sixteenth century.
Lavinia	Titian (1477–1576)	Venetian	The daughter of Titian; showing his usual skill in the treatment of flesh and sumptuous fabrics.
Adoration of the Shepherds	Hugo van der Goes (1435–1482)	Flemish	Shows Van der Goes' interest in the realism of daily life in the shepherds excitedly rushing in to see the newly-born Infant.
The Bladelin Altarpiece	Roger van der Weyden (1400–1464)	Flemish	The Nativity—with the donor, Peter Bladelin—occupies the center; the wings show the Christ Child appearing in the sky as a star to the Magi and the Tiburtine Sibyl revealing to the Emperor Augustus a vision of the Virgin and Child.

IV. In the Museum of Fine Arts, Boston

Catalonian Fresco	(12th century)	Byzantine	Splendid Byzantine decoration of the apse of a little Romanesque church in Spain.
Infanta Maria Theresa	Velasquez (1599–1660)	Spanish	Painted after the artist's second visit to Italy in 1651, showing mastery of color values and relations, texture and brush.
St. Luke Painting the Virgin	Roger van der Weyden (1400–1464)	Flemish	Shows some influence of the Italians who were active when van der Weyden visited Italy in 1450. This one is thought to be the original of which various copies were made.
The Quarry	Gustave Courbet (1819–1877)	French	Hunting the roebuck in the high Jura. The artist himself is listening as the horn sounds the Hallali.
Emma and Her Children	George Bellows (1882–1925)	American	One of the most important works of this artist—a portrait of his wife and children. The bold technique, design and color are reminiscent of Goya, Daumier and Manet.
Portrait of George Washington	Gilbert Stuart (1755–1828)	American	Painted from life in 1796, at Philadelphia, and considered the standard likeness of Washington.

V. In the Art Institute of Chicago

Retable and Altar Frontal	(14th century)	Spanish	Scenes from the life of Christ and the Virgin in the style of an enlarged miniature dated 1396, with portraits of the donor and his family.
Assumption of the Virgin	El Greco (1545–1614)	Spanish	In this altarpiece El Greco uses the Titian motive of the soaring Virgin but the treatment shows the beginning of his own peculiar style.
Life of St. John the Baptist	Giovanni da Paolo (ca. 1403–1483)	Sienese	A masterpiece by this artist showing his imaginative and dramatic quality and his fantastic treatment of landscape.
Wings of Altarpiece	School of Amiens (15th Century)	French	Seven panels, all that remains of an altarpiece of great decorative quality painted for an ancient monastery near Abbeville.
St. George Combating the Dragon	Catalan Master (15th Century)	Spanish	Splendidly decorative and highly important in the history of the Catalan School.
Madonna and Child	Roger van der Weyden (1400–1464)	Flemish	Brilliant jewel-like color and texture.
The Story of Rinaldo	Tiepolo (1696–1770)	Venetian	A great decoration in a brilliant style telling the idyllic love story of Armida and the young Crusader Rinaldo.
In the Circus	Renoir (1841–1919)	French	Two little jugglers, notable in design as well as in color and radiant envelope of light.
Stoke-by-Nayland, Suffolk	Constable (1776–1837)	English	A very important landscape by Constable in his most spontaneous and vigorous manner.
Sunday at the Grande Jatte	Seurat (1859–1891)	French	A masterpiece of Seurat illustrating his pointillist technique and vigorous design.
The Bedroom at Arles	Van Gogh (1853–1890)	Dutch	The artist's own room at Arles showing the emotional intensity with which he could invest the most insignificant subject.
The Basket of Apples	Cézanne (1839–1906)	French	One of the artist's finest achievements in design and in expression of form through color.
The Interrupted Reading	Corot (1796–1875)	French	Showing Corot's mastery of the figure for which he is too little known.
The Home of the Heron	Inness (1825–1894)	American	Sensitive romantic treatment of mood in landscape.

VI. In the Dresden Gallery

The Sistine Madonna	Raphael (1483–1520)	Umbrian	The Virgin and Child float forward in the clouds. Pope Sixtus and St. Barbara kneel before them.
Sleeping Venus	Giorgione (1478–1510)	Venetian	Brilliant color and golden glow—prototype of a long series of Venetian paintings of the nude Venus.
Tribute Money	Titian (1477–1576)	Venetian	The story is told by two half length figures, the realistic tax collector and classic Christ, sharply contrasted in character and color.

FAMOUS PAINTINGS IN IMPORTANT GALLERIES—Continued

VI. In the Dresden Gallery—Continued

Title of the Painting	Painter	School	Comments
The Cheat	Caravaggio (1560–ca. 1609)	Neapolitan	An example of Caravaggio's realism and of his experiments in light.
Lady Washing Her Hands	Ter Borch (1611–1681)	Dutch	A sensitive treatment of the intimate scene, especially fine in rendering of textures.
Holy Night	Correggio (1494–1534)	Venetian	One of the later pictures of Correggio with movement and excitement among the figures and a dramatic light contrasted with night out of doors.
Finding Moses	Veronese (1528–1588)	Venetian	A splendid design in swinging curves. The Pharoah's daughter and the other figures wear gorgeous costumes of Veronese's day and Egypt is represented by an Italian landscape and the great bridge of Verona.
Madonna and Four Saints	Titian (1477–1576)	Venetian	A painting of beautiful texture and brilliant color in which Titian breaks up the old symmetry of the altarpiece by moving the radiant Virgin and playful Child to one side.

VII. In the Pitti Gallery, Florence

The Concert	Giorgione (1478–1510)	Venetian	Some critics attribute this to Giorgione; others think the strong form and dramatic quality of the central figure point to Titian.
Pope Julius II	Raphael (1483–1520)	Umbrian	One of Raphael's greatest character interpretations.
Granduca Madonna			So called because the Grand Duke Ferdinand was so fond of it that he took it with him on his travels.
Portrait of Ippolito de' Medici	Titian (1477–1576)	Venetian	A superb portrait of Ippolito in Hungarian hunting dress of rich purple velvet.
Portrait of Cardinal Bentivoglio	Van Dyck (1599–1641)	Flemish	A distinguished portrait, in a scheme of brilliant reds, painted in 1624 when Van Dyck was in Rome.
Madonna and Child	Fra Filippo Lippi (1406–1469)	Florentine	The design is well adapted to the circular panel. In the background are shown the meeting of Joachim and Anna and the birth of the Virgin.

VIII. In the Uffizi, Florence

Birth of Venus	Botticelli (1447–1510)	Florentine	Born of the sea foam, the goddess is wafted ashore by the breath of the Winds.
Adoration of the Magi			The group includes three of the de'Medici family and at the right the figure of Botticelli himself.
Spring			The goddess of Love presides over a springtime festival. Her son Eros aims his dart at the Graces who are dancing before Hermes. Flora scatters flowers before the Spring who advances in the embrace of the Wind.
Madonna Enthroned	Cimabue (1240–1301)	Florentine	New life injected into the Byzantine formula by the first great master of the Florentine School.
The Annunciation	Simone Martini (1285–1344)	Sienese	An exquisite decoration on a background of gold; Byzantine expression and gesture modified by Sienese feeling.
Heracles and Hydra	Antonio Pollajuolo (1429–1498)	Florentine	Hercules engages the many headed Hydra—an example of the artist's contribution to representation of the body in violent movement.
Madonna of the Harpies	Andrea del Sarto (1486–1531)	Florentine	So named from the harpies which are carved on the pedestal.
Portrait of the Duke of Urbino	Piero della Francesca (1416–1492)	Umbrian	Remarkable for realism of characterization and for unity of linear pattern.
Madonna of the Goldfinch	Raphael (1483–1520)	Umbrian	Raphael's characteristic pyramidal grouping against a spacious landscape.
Altar of the Portinari Family	Hugo van der Goes (1435–1482)	Flemish	One of the most important Flemish altar pieces, so called because it was ordered by Tommaso Portinari, representative of the Medici Banking House. Portraits of Portinari, his wife and their children are on the wings.
Holy Family	Michelangelo (1475–1564)	Florentine	One of the rare panels painted by Michelangelo. His interest lay in the composition and form of his figures, not in their religious significance.
Coronation of the Virgin	Fra Filippo Lippi (1406–1469)	Florentine	Painted for the nuns of St. Ambrosio—radiantly informal, joyous and exciting.
Deposition	Fra Angelico (1387–1455)	Florentine	Showing broad, panoramic treatment in the Lorenzetti tradition; rendered in pure sparkling color.
Adoration of the Magi	Leonardo da Vinci (1452–1519)	Florentine	This has been called the richest, most complicated, most beautifully ordered picture of the century. Unfinished.
Baptism	Verrocchio (1435–1488)	Florentine	It is supposed that the delightful angel at the left was added by Leonardo.

IX. In the Haarlem Museum, Haarlem

Officers of St. George	Frans Hals (ca. 1580–1666)	Dutch	Nineteen men alive and alert; ruddy flesh tones set off by black costumes with crimson sashes.
Banquet of Officers of St. George			One of Hals' earliest known pictures. A vivid portrayal of the group of banqueters caught with the most natural attitudes and gestures.
Officers of St. Adrien			Probably the most successful of his large group pictures of companies of archers; a wonderful canvas in which the subjects are completely characterized and bound into a decorative whole.
Regents of St. Elizabeth's Hospital			Such portrait groups of directors of charitable and other public institutions were much in demand in seventeenth century Holland.
Lady Governors of St. Elizabeth's			An impressive work in which every figure is a remarkably individualized portrait. Executed when Hals was past eighty years old.

X. In the Royal Museum, The Hague

Robert Cheseman	Holbein (1497–1543)	German	Portrait of the king's falconer richly dressed in fur-lined coat with red sleeves; textures marvelously rendered, especially the feathers of the falcon.
Anatomy Lesson	Rembrandt (1606–1669)	Dutch	Professor Tulp demonstrates on a cadaver. A group of excellent portraits in Rembrandt's manner before he had attained a greater unity through his use of light and dark.
Isabella Brant	Rubens (1577–1640)	Flemish	An impressive portrait of Rubens' first wife, suggestive of his Venetian inheritance.
Helena Fourment			A seated portrait of Rubens' second wife.
View of Haarlem	Jacob Ruisdael (1628–1682)	Dutch	Dramatic play of light and dark on a linen bleaching scene near Haarlem.
Anna Wake	Van Dyck (1599–1641)	Flemish	Showing Van Dyck's splendid portrayal of texture and interesting pattern, especially in the lace collar, sleeves, jewelry and fan.

XI. In the Hermitage, Leningrad

Evening	Claude Lorrain (1600–1682)	French	One of a group of landscapes expressing the mood of morning, noon, evening and night in this artist's imaginative and classical style.
The Swamp	Jacob Ruisdael (1628–1682)	Dutch	Sunlight playing through twisted trees, showing Ruisdael in his romantic attitude toward nature.
Isabella Brant	Rubens (1577–1640)	Flemish	Last and most interesting portrait of Rubens' first wife, with curtain and architecture in the Venetian tradition.
Helena Fourment			Impressive full length portrait of artist's second wife against a stormy sky.
Slav Prince	Rembrandt (1606–1669)	Dutch	Portrait of a magnificent Pole in a great head-dress and gleaming with the fire of jewels.

FAMOUS PAINTINGS IN IMPORTANT GALLERIES—Continued

XI. In the Hermitage, Leningrad—Continued

Title of the Painting	Painter	School	Comments
Return of the Prodigal Son	Rembrandt (1606–1669)	Dutch	Showing the intense feeling with which Rembrandt interpreted the Old Testament stories and his dramatic use of light and dark to give accent and mystery.
Sacrifice of Abraham			
Danaë			One of this artist's few essays in the nude figure.
Old Woman in Black Head-dress			No one before Rembrandt so well realized the picturesque possibilities for play of light and dark on wrinkled face and knotted hands.
Old Man with White Beard			
Card Player	Chardin (1699–1779)	French	Charm of subject together with a color, texture and pattern that delight the eye.
Philip, Lord Wharton	Van Dyck (1599–1641)	Flemish	Van Dyck in his best vein of sensitive portraiture.
Queen Henrietta			Wife of Charles I of England.

XII. In the National Gallery, London

Avenue at Middelharnis	Meindert Hobbema (1638–1709)	Dutch	Shows the splendid expression of distance developed in this century.
Jan Arnolfini and His Wife	Jan van Eyck (1390–1441)	Flemish	Minute detail does not ruin the power of this portrait; a new realism of light in every part.
Man with Red Turban			The great red turban sweeping around the impressive head contributes to the vitality of the portrait.
Madonna of the Rocks	Leonardo da Vinci (1452–1519)	Florentine	Believed to be either a later replica by Leonardo or a copy by his assistant, Ambrogio da Predis, of the Virgin of the Rocks in the Louvre.
Chapeau de Paille	Rubens (1577–1640)	Flemish	Portrait of the sister of Rubens' second wife who, after his wife, was the artist's favorite model.
Judgment of Paris			An example of Rubens' mastery of form and rendering of golden flesh against an atmospheric background.
Château Steen			Late in life Rubens bought the country place of the Dutch painter, Jan Steen, and from that time on landscape became a prominent interest.
Doge Leonardo Loredano	Giovanni Bellini (ca. 1430–1516)	Venetian	A direct, forceful portrait; beautiful play of color—white, gold and orange against the old blue of the background.
Origin of the Milky Way	Tintoretto (1518–1592)	Venetian	Figures lightly poised in air with a feeling of space around them; subdued color harmony and luminous shadows.
Bacchus and Ariadne	Titian (1477–1576)		Story of Ariadne, deserted by Theseus, overtaken by Bacchus. The effect of impetuous movement is carried through the whole group.
The Tailor	Moroni (ca. 1520–1578)	Brescian	Well designed in a cool color scheme suggestive of the Spanish.
Lord Heathfield	Sir Joshua Reynolds (1723–1792)	English	One of his best works; a complete picture of English characteristics.
Lady Hamilton	Romney (1734–1802)	English	A delicate portrait free from sentimentality.
Valley Farm	Constable (1776–1837)	English	An exhilarating, fresh, unaffected study of light in a landscape showing out-of-door colors and effective masses of clouds.
The Shrimp Girl	Hogarth (1697–1764)	English	Spontaneous, live painting; fresh color and bold handling.
Canon and Patron Saints	Gerard David (1460–1523)	Flemish	Strongly individualistic portrait of the canon and saints in a simple unified composition.
Mystic Marriage of St. Catherine			Shows the influence of Memlinc in the delicate treatment of light but the figures portrayed are much less spiritual.
Cornelius van der Geest	Van Dyck (1599–1641)	Flemish	Strong interpretation of character and masterly drawing. Supposed to have been done when the artist was only twenty-one years old.
Court of Dutch House	Pieter de Hooch (1629–1677)	Dutch	A spacious and luminous composition—a study of a bright day without sunlight.
Mrs. Siddons	Gainsborough (1727–1788)	English	The face with its brilliant painting of flesh holds the interest; the figure and surroundings are enveloped in harmonious color haze.
Philip IV of Spain	Velasquez (1599–1660)	Spanish	Extremely simple and subtle in its rendering of form by color values.
A Franciscan	Zurbaran (1598–1662)	Spanish	A study of an impressive figure of simple and powerful design.
Artist's Father	Dürer (1471–1528)	German	The most minute observation of wrinkles, veins, blunt fingers, and the intense vitality of the old man's eyes.
Self Portrait	Rembrandt (1606–1669)	Dutch	Portrait of the artist in later life—shabby, gray-haired, with deeply lined face; simple in representation but subtle in its pattern of light and dark.
The Fighting Temeraire	Turner (1775–1851)	English	Turner's brilliant color. The famous battleship is being towed to her last berth.

XIII. In the Prado, Madrid

The Young Cardinal	Raphael (1483–1520)	Umbrian	Striking portrait of Cardinal Alidoro in brilliant red robe and cap.
Family of Charles IV	Goya (1746–1828)	Spanish	The royal family group is presented with ruthless characterization in the richest color and sparkling light.
Marie Louise of Parma			An unusually live portrait, a full length figure in an interesting combination of blues and greens.
The Entombment	Titian (1477–1576)	Venetian	Titian, as Joseph of Arimathea, is supporting the body of Christ; the emotional effect is achieved by movement of figures and the play of light upon them.
Charles V on Horseback			A great portrait of the emperor as the victor of Mühlburg, imaginative rather than realistic, but highly expressive of the emperor's character.
Crucifixion	El Greco (1545–1614)	Spanish	An example of the painter's mature style; the elongated forms and swift contrasts of light and dark heighten the emotional tension.
Don Roderigo Vazquez			Subdued color harmony in yellows and greenish blacks. Face and features, ruff and chain all accentuate the triangular motif.
Portrait of a Man	Dürer (1471–1528)	German	A splendid portrait, strong in characterization, of Hans Imhof, a Nuremberg banker.
Martyrdom of St. Bartholomew	Ribera (1589–1652)	Spanish	Typical example of work of this artist in its striking treatment of light and in its scientific study of various movements of the body.
Marie de' Medici	Rubens (1577–1640)	Flemish	Painted when the queen summoned Rubens to Paris to decorate the galleries of the Luxembourg with the story of her life.
Maids of Honor	Velasquez (1599–1660)	Spanish	Picture of the Infanta Margarita as she, with her maids, dwarfs and dogs, wandered into Velasquez' studio while he was painting a portrait of her parents, the king and queen of Spain.
Infanta Maria Theresa			The Infanta, in rose and silver against a red curtain, stands facing the light. A splendid example of the magic of Velasquez' running, slippery brush stroke.
The Tapestry Weavers			In the royal tapestry works of Madrid. The women in the foreground spin wind and card the wool; the distant figures in the sunlight are cleverly differentiated from the realistic figures of the tapestry.
The Topers			The amazing life and realism of Velasquez' early manner. Painted for the king in 1628.
The Surrender of Breda			Often called The Lances. Represents the Spanish General Spinola receiving in 1625 the keys of the city of Breda.
Queen Mary of England	Antonio Moro (1519–1576)	Flemish	A gorgeous court portrait of the determined queen by a painter who preserved the best traditions of Flemish painting through the sixteenth century.
Adoration of the Magi	Jerome Bosch (ca. 1460–1516)	Flemish	The mystery of the Nativity is treated seriously but the artist's satiric fancy is shown in the actions of the rustics climbing on the roof and peeking around corners.
Donor and St. John the Baptist	Robert Campin (1378–1444)	Flemish	Two panels of a triptych in which the furniture and accessories are treated with the extraordinary minuteness characteristic of Campin.
St. Barbara			

FAMOUS PAINTINGS IN IMPORTANT GALLERIES—Continued

XIV. In the Alte Pinakothek, Munich

Title of the Painting	Painter	School	Comments
The Four Apostles	Dürer (1471–1528)	German	Last work of Dürer—life sized, intense and powerful figures showing a breadth and grandeur not found in his other work.
Daughters of Leucippus	Rubens (1577–1640)	Flemish	Extraordinary rendering of form and movement; illustrating the story of Castor and Pollux carrying off the daughters of Leucippus.
The Lion Hunt			The dramatic struggle of wild animals defending their lives against man. Even such violence of movement Rubens organizes into fine design.
Landscape with Cattle			One of Rubens' last pictures; showing command over representation of space and of design in depth.
Elevation of the Cross	El Greco (1545–1614)	Spanish	Swift contrasts of light and dark heighten the emotional effect.
Deposition of Christ	Rembrandt (1606–1669)	Dutch	Rembrandt manipulates his light for drama, emotional expression, and the revealing of significant forms.
Seven Joys of the Virgin	Memlinc (ca. 1430–1494)	Flemish	An altarpiece, depicting events in the life of the Virgin, painted in 1480 for the guild of Tanners; in a romantic landscape the minute figures stand out in brilliant and subtle gradations of color.

XV. In the Metropolitan Museum, New York

Ville d'Avray	Corot (1796–1875)	French	A river with trees "drenched with light," characteristic of Corot's work in the cool blue-greens of early morning light.
Abduction of Rebecca	Delacroix (1798–1863)	French	A spirited and romantic illustration of Scott's Ivanhoe depicting Rebecca being carried from the burning castle.
Portrait of Philip IV	Velasquez (1599–1660)	Spanish	Known as the Villahermosa portrait because it hung in the Villahermosa Palace in Madrid for many years.
Wheatfields	Jacob Ruisdael (1628–1682)	Dutch	Extraordinary illusion of moving light; sudden illumination of parts with clouds scudding across the wheatfields.
Woman Opening Casement	Vermeer of Delft (1632–1675)	Dutch	An effect of diffused light, as if from a northern exposure, throughout the picture.
Woman with a Parrot	Manet (1832–1883)	French	An extremely subtle color study in tones of yellow-rose showing the artist's special technique of broad areas of light and color.
Portrait of Madame X	John Singer Sargent (1856–1925)	American	The brilliant style of Sargent at his simplest and best.
The Nativity	El Greco (1545–1614)	Spanish	Flame-like movement throughout the canvas.
Don Sebastian Martinez	Goya (1746–1828)	Spanish	Portrait of lawyer and art patron of Cadiz; subtle range of color and economy of means in rendering the stiff texture contrasted with the detail given to the head.
James, Duke of Lennox	Van Dyck (1599–1641)	Flemish	Has the quality of distinction characteristic of Van Dyck and his splendid rendering of varied textures.
Junker Ramp and His Sweetheart	Frans Hals (1580–1666)	Dutch	A lively picture of a tavern scene. An example of Hals' early work in rich and varied color.
The Maine Coast	Winslow Homer (1836–1910)	American	By the American realist whose marines are known for their depth and weight and power.
Christ after the Resurrection	Roger van der Weyden (1400–1464)	Flemish	The third panel of a famous triptych, the other parts of which are in the Cathedral of Granada.
Holy Family	Rubens (1577–1640)	Flemish	Life size figures of Virgin and Child with infant St. John. St. Francis is at the left, St. Joseph at the right, and St. Elizabeth stands back of the mother and child.
Landscape	Poussin (1594–1665)	French	Showing depiction of far distance space, which was one of the chief innovations of the seventeenth century.
Madame Charpentier and Children	Renoir (1841–1919)	French	In the cool delicate color of Renoir's early period.
Meditation	Carpaccio (1460–1522)	Venetian	Two hermits meditating on the death of Christ; similar to Giovanni Bellini in design.

XVI. In the Louvre, Paris

Mona Lisa	Leonardo da Vinci (1452–1519)	Florentine	Often called La Gioconda. The most subtle interpretation of character and an equally subtle modeling of form.
Madonna of the Rocks			An original and intense conception of the Virgin and Child, little John, and an angel in a romantic setting.
Madame Récamier	Louis David (1748–1825)	French	The classical portrait at its best—a finely organized pattern of flowing line.
The Gleaners	Millet (1814–1875)	French	A poem of peasant life—powerfully constructed figures in rhythmic movement against a vast plain.
Marriage at Cana	Veronese (1528–1588)	Venetian	The Bible story converted into a gorgeous banquet of the Venetian Renaissance.
Man with the Glove	Titian (1477–1576)	Venetian	One of the great portraits of all time, in the lyrical spirit of Titian's youth.
The Entombment			A dramatic and poignant rendering of the subject, rich in color and in arabesque of line.
The Lace Maker	Vermeer of Delft (1632–1675)	Dutch	The broad and simple treatment of light in a scheme of blue and yellow that was characteristic of Vermeer.
Olympia	Manet (1832–1883)	French	Famous example of early Impressionism; remarkable for the delicacy of flesh set off by the varied whites of the scarf and linen.
Shepherds in Arçadia	Poussin (1594–1665)	French	Reminiscent of the ideal figures of Raphael and of ancient sculptured reliefs; a French version of the classical tradition of the Italian Renaissance.
Supper at Emmaus	Rembrandt (1606–1669)	Dutch	Showing Rembrandt's simple telling of the gospel story and his use of light and dark to create deep religious feeling.
Hendrickje Stoffels			Splendid modeling of the face with Rembrandt's characteristic illumination; suggestive treatment of fur, rich fabrics and sparkle of jewels.
Banker and his Wife	Quentin Matsys (1466–1530)	Flemish	One of the earliest examples of *genre* painting for its own sake, executed with the skill and detail characteristic of the Flemings.
Gipsy Girl	Frans Hals (1580–1666)	Dutch	Showing the artist's ability in creating an impression of life and movement and his dashing use of the brush.
Mystic Marriage of St. Catherine	Correggio (1494–1534)	Venetian	A study in light and in brilliant transparent color, like that of Venetian glass.
Pastoral Symphony	Giorgione (1478–1510)	Venetian	Showing the romantic quality of Giorgione's idylls and the warm glow of color characteristic of the Venetians.
La Belle Jardiniére	Raphael (1483–1520)	Umbrian	One of the finest of Raphael's series of pyramidal compositions of the Madonna and Child and little John in a spacious Italian landscape.
Virgin and Child with Chancellor Rolin	Jan van Eyck (1390–1441)	Flemish	Showing Jan van Eyck's jewel-like color, his portrayal of character, of texture, and of the intimate and picturesque details of Flemish life.
Portrait of Erasmus	Holbein (1497–1543)	German	Powerful characterization has seldom been carried so far as in this portrait.
Embarkation for Cythera	Watteau (1684–1721)	French	The lovers of Watteau's fairyland embark for the island of Aphrodite. The light suffusing the canvas moves in rhythmic pattern.
La Source	Ingres (1780–1867)	French	The simple modeling, the delicacy and truth of line reveal the classical qualities of Ingres; painted when he was seventy-six.
La Kermesse	Rubens (1577–1640)	Flemish	Realistic and exuberant portrayal of Flemish peasant life. The tumultuous and sweeping action is bound into a masterly design.
Landing of Marie de' Medici at Marseilles			One of the series of twenty-one decorative canvases of episodes in the life of Marie de' Medici.
Infanta Margarita	Velasquez (1599–1660)	Spanish	Exquisite color and subtle tone values in the satin dress and silky hair of this small daughter of Philip IV of Spain.
Charles I	Van Dyck (1599–1641)	Flemish	One of the artist's greatest achievements in color and clever subordination of unimportant figures.

FAMOUS PAINTINGS IN IMPORTANT GALLERIES—Continued

XVI. In the Louvre, Paris—Continued

Title of the Painting	Painter	School	Comments
The Mother	Whistler (1834–1903)	American	A subtle characterization although the artist said that his real interests were expressed in his title, "An Arrangement in Gray and Black."
The Burial at Ornans	Courbet (1819-1877)	French	This sincere and vigorous painting initiated the realistic movement. The mourners are Courbet's relatives and friends in his native town of Ornans.
Dante and Virgil	Delacroix (1798–1863)	French	Virgil escorts Dante across the river Styx. The dramatic intensity and rich emotional color are significant of the new Romanticism.
The Blue Vase	Cézanne (1839–1906)	French	A still-life by Cézanne alive with movement that is resolved into perfect order of line and color and space.
Madonna	Memlinc (ca. 1430–1494)	Flemish	Madonna adored by Jacques Floreins, his wife and their sixteen children, showing the artist's seductive color and polished technique.

XVII. In the Villa Borghese, Rome

Sacred and Profane Love	Titian (1477–1576)	Venetian	Titian at his height in richness of color and in the texture of nude forms and sumptuous fabrics. Misnamed by this title. Some think it shows Venus persuading Helen to harken to Paris or calling upon Medea to aid Jason.
The Entombment	Raphael (1483–1520)	Umbrian	Showing the struggles of Raphael to adapt the various influences to which he was open upon his arrival in Florence.
Diana and Her Nymphs	Domenichino (1581–1641)	Bologna	Spirited nude girls in a landscape setting, by an eclectic Italian whose influence may be traced all through Poussin's masterpieces.
Danae	Correggio (1494–1534)	Venetian	Showing Correggio's powers in illusion of depth and his imaginative treatment of the Greek myth.

XVIII. In the Vatican Gallery, Rome

Transfiguration	Raphael (1483–1520)	Umbrian	Good example of Raphael's space design and use of gesture to unite figures but over-dramatic and lacking in complete unity; lower part finished by Giulio Romano.
Madonna di Foligno	Caravaggio (1560–1609)	Naples	With portrait of Sigismondo Conti as donor.
The Entombment			One of his two most important paintings in which the artist turns the story into drastic contemporary tragedy.
Madonna in Glory with Six Saints	Titian (1477–1576)	Venetian	Below the Mother, Child and angels are the six saints, Catherine, Nicholas of Bari, Peter, Anthony, Francis and a sad Sebastian.
Portrait of Sixtus IV	Melozzo da Forli (1438–1494)	Umbrian	Historical portrait group of Sixtus IV, his librarian, and attendant cardinals, executed to commemorate the reorganization of the Vatican library by Sixtus IV in 1475.
St. Antonio and Saints	Antonio Vivarini (active ca. 1440-1470)	Venetian	Paintings of this altarpiece, dated 1464, are characteristic of conservative tendencies in Venetian painting before advances of the remarkable Bellini family.

XIX. In the Royal Gallery of Fine Arts, Venice

Madonna of the Trees	Giovanni Bellini (ca. 1430–1516)	Venetian	Showing the breadth of modeling and the life and vitality of the developed Bellini.
Ursula's Vision	Carpaccio (1460–1522)	Venetian	The angel offers to the dreaming Ursula the martyr's palm; one of nine canvases telling the picturesque adventures of Ursula.
Presentation			Ruskin considered this the most beautiful baby Christ in all Venetian art. Below is the Bellini motive of music-making angels which became a characteristic feature of Venetian painting.
Miracle of St. Mark	Tintoretto (1518–1592)	Venetian	Irresistible downward rush of figure in mid air, rhythm of movement in space and golden brilliance of color.
Death of Abel			Dramatic and poignant in expression; superbly balanced masses of light and shade.
Procession in Piazzo of San Marco	Gentile Bellini (1429–1507)	Venetian	A procession on Corpus Christi day showing the artist's capacity as painter of light and air; valuable as a record of the Square about 1492.

XX. In the Imperial Gallery, Vienna

Madonna of the Cut Pear	Dürer (1471–1528)	German	Showing Dürer's German type of Madonna painted with minuteness and precision.
Madonna with Cherries	Titian (1477–1576)	Venetian	In this early picture Titian shows the more mature type of Virgin and the informal composition that were to distinguish later Venetian painting.
Gipsy Madonna			This picture, under the influence of his master, Giovanni Bellini, foreshadows the splendor of his later coloring.
Portrait of Jane Seymour	Holbein (1497–1543)	German	Portrait of the third wife of King Henry VIII rendered in the miniature-like style that Holbein occasionally adopted.
Portrait of Helena Fourment	Rubens (1577–1640)	Flemish	Portrait of Rubens' second wife, nude with a fur coat about her.
Miracle of St. Ildefonso			One of his later masterpieces in which light and color had become major interests. The Virgin gives a chasuble to St. Ildefonso and the archduke Albert and his wife kneel at either side.
Infanta Margarita Theresa	Velasquez (1599–1660)	Spanish	A portrait of the Infanta in a color scheme of silver, black and coral that was characteristic of Velasquez.
Hunters in the Snow	Breughel (ca. 1525–1569)	Flemish	An innovation in landscape and representation of great space.
The Rustic Wedding			The wedding feast serves as a pretext for displaying all the artist's excellence of color; the red caps, white coifs and the yellow omelettes are combined in an unusual color harmony.
Portrait of His Mother	Rembrandt (1606–1669)	Dutch	Rembrandt was probably the first artist to interpret old age with sympathy.
Madonna of the Meadow	Raphael (1483–1520)	Umbrian	Painted in 1506 during Raphael's stay in Florence and under the influence of Leonardo da Vinci.
Birth of Christ	Gerard David (1460–1523)	Flemish	Remarkable for its effect of light which emanates from the Child's body and encompasses the Virgin and three adoring angels.
Virgin and Donor	Memlinc (ca. 1430–1494)	Flemish	One of Memlinc's small masterpieces depicting the Virgin and worshiping donor in the central panel, with full-length figures of the two St. Johns on the inside of the shutters and of Adam and Eve on the outside.

This list is merely an introduction to the great galleries of the world and certain of their treasures. It does not include all the great museums, omitting especially the smaller galleries which may be very important on account of the masterpieces they possess. Neither does it represent the most important paintings of the world, for there are many such paintings that are not in museums but in churches and buildings for which they were originally painted. For instance, we do not go to museums to see the works of Giotto, the great Florentine, but to the Arena Chapel at Padua; and the greatest paintings of Rome are not in the galleries of Rome but in the apartments of the Vatican decorated with the great frescoes of Raphael, and in the Sistine Chapel where Michelangelo spread upon the ceiling his great drama of creation.

THE GRAPHIC ARTS

THE graphic arts include the making, with tools, of pictures or designs on copper, zinc, stone and wood; and include the printing by hand or on presses for that purpose. The prints are made with ink on paper, vellum and, in some instances, on fabrics. The forms, named for the methods employed, are etching, soft ground etching, drypoint, engraving, aquatint, mezzotint, woodcut, block print and lithograph.

The advantage of the graphic arts over painting and sculpture lies in the wide dissemination of pictures at a moderate cost. It has been authoritatively stated that the world has been influenced more profoundly by the printed, than by the painted picture. Great paintings and sculpture are found in art galleries, museums and private collections where but limited numbers have the opportunity to study them. There are reproductions of these masterpieces; but they are reproductions only and are merely reductions of the originals.

In the graphic arts there may be varying numbers of prints up to hundreds, each print being an exact duplicate of the plate of metal, stone or wood from which it is made. Each is therefore an original—not a reproduction of the artist's work, but a duplication.

Printing involves the use of ink, usually black. This, however does not deprive the graphic arts of the range of color possible to painting; for methods of printing have been developed to such a high degree of perfection as to present all the range of color used in painting; this is accomplished chiefly through lithography.

An additional factor in the enjoyment, knowledge and possession of the products of the graphic arts is the fact that prints may be, and mostly are, limited to a size for easy handling. They range from plates no larger than a postage stamp to the average size which comprises most collections in portfolios, coming within the range of fifteen by twenty inches. Prints have been and are made in large sizes, the large lithographic posters on billboards being examples. Size is and should be determined by the medium used. Size has nothing to do with the quality of art, the acme of which may be included in a small space.

When the matter of rarity enters, printed pictures may equal paintings in cost, but first published prices are usually nominal and within the reach of moderate purses. Enthusiastic collectors of prints enjoy a game that brings deep satisfaction and the power to share it with others.

ETCHING

Chronologically, etching belongs at the end of the list of graphic arts; but because, at this writing, it is receiving more attention in America than it has in fifty years, it shall be considered first.

No etcher after Dürer made a lasting impression until Rembrandt began his notable work between the years 1628 and 1665. In him, the art reached its greatest perfection and found its widest expression; in all the intervening years no one has arisen to dethrone him. Before him, and somewhat after, etching was used as a mere adjunct of engraving with no separate existence of its own until he raised it to a high art; since then it has suffered periodical decadence and restoration to favor, coincident with the rise and fall of specialized interest in art.

The method of etching is suggested by its name translated from the Dutch (where it was first used): *etsen*, or the German *essen*, "to eat"; applied specifically, it denotes the eating or corrosive action of acids on metal.

This reference to acid should make it clear that etchings are not drawings in pen and ink, nor are they reproductions by photography. They are printed from a metal plate, usually copper or zinc, upon which the lines have been etched or deepened by acid.

Etching

Halftone of a self-portrait of Rembrandt, richly dressed, leaning on a stone sill. The greatest of all etchers did his work between 1628 and 1665.

Preparation of the Plate. The plate of polished metal is about one-sixteenth of an inch thick, cut to the dimensions required. In order to subject it safely to the action of acid, usually nitric, the plate must be covered with a protecting substance. This is found in a preparation of wax, asphaltum and pitch called a "ground," which is melted and spread thin by roller or dabber on the hot plate. When cold, this thin covering, free from impurities and holes, forms a smooth, hard surface, made black by smoking over a candle flame, through which lines are drawn by a steel needle.

Making the Drawing. Some artists work from the subject directly upon their plates with the needle, just as they would sketch with pencil on paper. In this case the drawing, when printed, will be in reverse. Others make careful drawings with ink or pencil on paper and transfer them, by various methods, to the plate in reverse. Such a picture, when printed, will be a positive. The transferred lines are visible on the wax ground, and may be followed with the needle. This insures greater accuracy in drawing and placing, inasmuch as all corrections may be made before the transfer; but the careful procedure is not so likely to convey that spontaneity and freshness of inspiration that is apparent when a well directed needle records the impressions of the moment upon the metal itself.

As the lines are drawn only through the wax, they must be made permanent upon the plate. This is accomplished by applying acid, usually nitric, nitrous fuming, Dutch mordant or perchloride of iron, in one of two ways: either by dropping it on the plate and moving it about with a feather, or by entirely submerging the plate (held by waxed strings) in a glass or porcelain dish. The strength of the acid to be used is determined by the atmosphere. If warm, it calls for a weak solution, say three parts of water to one of acid. Cold, on the other hand, produces sluggish chemical action and the solution must be strengthened accordingly.

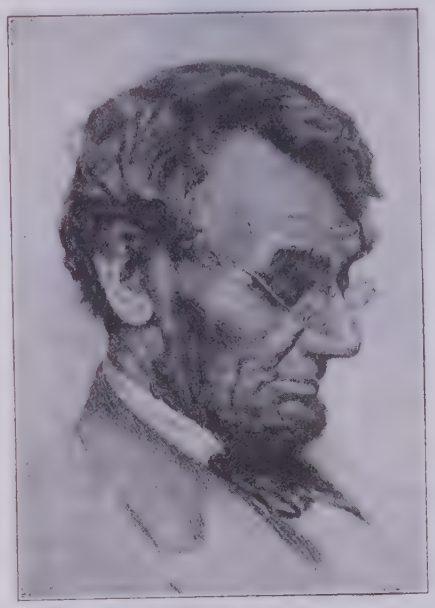
If the lines have been drawn with a fine needle, they may be varied in strength and depth by submitting them to the acid in longer or shorter intervals. Delicate lines representing distance should be exposed but a short time, probably a minute or two, according to the strength and biting of the acid. The plate is then taken out of the solution, washed carefully in cool water, dried and the finest lines covered by a small brush with stopping-out varnish. When dry, the plate may be returned to the acid, and exposed for the next grade of lines for a period of several minutes or more, after which the process of washing, drying and stopping out is repeated. In this way the work is carried forward until the variety of line desired is gained. Some etchers vary their lines by using fine and coarse needles, giving but one biting. Others work on the plate while it lies in the acid, putting the heaviest lines in first, and ending with the lightest. There is no way of determining, except approximately, what the acid is doing until the wax ground is removed by kerosene or turpentine after the plate is warmed.

There are three distinct chances for failure in making an etching: in the drawing, the biting and the printing. An artist may be an excellent draftsman and draw lines on the copper faultlessly, but the etching will not be a success unless he possesses the knowledge of how to bite lines into the copper. Again, he may have the skill to draw and bite, but his plate will be useless if it is not well printed. Many etchers do not attempt the printing, but leave it to persons who make that their profession. The most satisfactory results are obtained when the artist does his own work from the first drawing to the final print, but the expense of the necessary equipment is so great as to prohibit etching as a pastime. The practice involved in acquiring skill in printing plates is such as to put it out of the hands of most etchers for anything but the simplest proofs of their work.

The chief joy of an etching is its spontaneity. In the hands of a skillful worker, it may be rushed through to completion, and the etcher may look upon the moist print of his copper plate before the white heat of his enthusiasm cools. This joy is unknown to the artist who must send his plate to a professional printer for a proof. Even a day is too long to wait, and a day may turn into weeks. So the etcher who can take his plate out of the acid, wash and dry it for the last time, warm and remove the wax ground and

turn at once to his press to prove his hopes is the only one to taste the full fruition of pleasure in his work.

Printing. A thoughtful etcher will have prepared his paper before it is time to print by dipping it in clean water, or by sponging it, and putting it in little piles between blotters upon which are heavy weights. If he grinds his own ink, which is made of a fine black powder and plate oil, he will have that ready also.



With a smooth roller, or dabber, the thick ink that stands up in a shiny heap, is forced into the lines. The whole surface of the plate is solidly black. With a pad of open meshed cloth—tarlatan is best—the ink lying on the surface of the plate is carefully wiped off, leaving the sunken lines full. At this point, it might be stated, there are many methods of manipulation which would result in the production of various effects. An explanation of these, however, would be interesting and comprehensible only to a printer. Both bare hand and cloth may be used to free the plate from superfluous ink and yet leave what is necessary to produce the effect desired.

The plate, which should be warm, is laid on the steel bed of the press; over it is laid a sheet of paper moistened with water until it is limp and soft, but not wet. Over this are placed several fine white blankets woven for this purpose. Then the bed passes between two heavy steel rollers, as clothes are fed into a wringer, coming out and stopping on the other side. The pressure should be even and as heavy as it can be and still allow the bed to pass between the rollers. The soft blankets force the moist paper into the lines, and the sheet takes up all the ink it finds there. When the blankets are lifted and the paper peeled off the metal plate, permanently embossed upon the paper will be the ridges of ink that filled the etched lines, together with any tone left on the surface. This is the crucial moment in the whole work of etching. Up to this time there has been no certainty of what has been accomplished. The lines may be clearly seen upon the plate, but it is not enough merely to make a line; there should be fine lines, heavy lines, deep and shallow lines, black, gray, rich and ragged lines. The success of the biting lies in the quality of the lines. Hence it is a staid heart that does not quicken when the first proof of an etched plate is lifted.

Alterations. If the proof is satisfactory, the plate is ready for further printing. If some lines are too heavy, they are first scraped with a sharp edged scraper, burnished with a smooth polished burnisher and rubbed down with fine charcoal and a buffer, reducing them to the desired depth. If the lines are too light, the plate may again be covered with a wax ground and the lines bitten deeper. Lines may be added or erased, but never with ease; it is a slow and tedious process to make alterations on a plate.

Color. The color of an etching results from, and corresponds with the color of the ink with which it is printed. There may be color on the print where there are no lines; this is a thin film of ink left on the surface of the plate. Wiping a plate clean puts the whole burden of the story on the lines. If they are not expressive and full of quality, the picture may as well have been drawn with pen and ink. But a printer with a painter's touch knows how to make hard lines sympathetic, and draws them all together with a bond of tone. A plate, however well it may be etched, is not complete nor desirable unless it is well printed. Although etching is primarily a linear process, colors other than black are used; but they are always put on the plate and never on the paper, except in the way described above.

Paper. Both paper and ink are large factors in the success of an etching. Any plate that can stand the test of white paper and black ink is likely to be well done, for it is a severe combination. Ink that is slightly warmed by brown, printed on paper of a creamy tone, is generally more pleasing. Soft Japan paper is still more mellow, but not brilliant. All Japanese papers are likely to grow woolly with handling, and are difficult to clean. Handmade papers are desirable for their texture and lasting qualities. An etcher who makes prints for the future must look carefully to the paper he chooses. Most attractive of all are the precious sheets of old handmade paper made in early centuries, some of which are still discoverable in old shops in Italy, Germany, France and Holland. A rare proof may be seen on a worm-eaten sheet of paper, on the other side of which may be found accountant's notes of three centuries ago. But with its very age has come a tone and quality that cannot be duplicated in modern paper.

Drypoint

A halftone reproduction of a drypoint, portraying Lincoln reading. By O. S. Schneider of Chicago.

Perfect tonality is difficult in an etching, except with great labor and skill, and labor is the one thing that should not be apparent in an etching. The action should appear effortless and spontaneous, just as one would pen a letter to a friend. This is why etching is called the most autographic of all arts. Its strong points are brevity, freedom, precision and power; but coarseness of line is not to be confused with strength, nor does delicacy of lines indicate weakness. Etching is the intimate art—the art of the home and of the hand. Poring over a portfolio of master prints is a recreation that never palls, because the final word is never said; there is always a new impression to meet a different mood.

DRYPOINT

Drypoint is so frequently used and confused with etching, both as to method and result, that only those familiar with the work may be expected to name it correctly. The general term "drypoint etchings" (used even by dealers carrying prints), is the safe, though compromising, ground taken, the assumption being that if the print does not happen to be an etching, it may be a drypoint. True, it can be both, if both mediums have been used in the plate; but this is not easy for the amateur to distinguish.

An etching is etched with acid, as its name implies; a drypoint, on the other hand, is a method of engraving on metal with a sharp cutting needle or diamond point without the intervention of acid, hence the term "drypoint." The work is different and the result is different from etching, as the student will quite readily detect and understand with observation.

With a sharp steel point or, better, with a ruby or diamond set in a handle which is held in a slanting position, lines are cut into the metal plate lightly or deeply, doing at once what the acid takes longer to do. As the cutting edge acts much like a plow throwing a furrow, so the edge of a drypoint line holds a burr which, unless removed with a scraper, is the one distinguishing characteristic of the method. When the plate is wiped and inked, the burr catches it and spreads it like the edge of a tiny feather along the line, thereby producing a rich, velvety appearance not made by any other line. Not only the lightest line possible, but also the heaviest, makes drypoint a desirable medium for portraits and subjects in which great variation and delicacy are required. It lacks the freedom of the etched line because, in its making, it must be guided with pressure sufficient to carve out the metal. Moreover, a drypoint plate yields fewer proofs than an etched one because the delicate burr quickly wears away with the manipulation of inking and wiping the plate. Since the mechanical work of biting a plate is the greatest stumbling block in etching, the omission of grounding and biting and the directness of the method leads many artists to drypoint; but as they are more difficult to print than an etched plate, the preference is not without its drawbacks.

SOFT GROUND ETCHING

It is not recorded how or why a line that looks like a pencil or lithographic line was preferred to the clear sharp one given by regular etching. But probably soft ground etching was invented for the purpose of producing a line that may be used with perfect harmony in aquatints, which is a method employing tone made up of small dots.

Instead of using a pointed steel needle, soft ground etchings are drawn with a lead pencil on a metal plate covered with a wax ground which is soft instead of hard. Ordinary etching ground is mixed with tallow in such correct proportions that whether it be used

in summer or winter, it does not become hard. Over the plate is stretched a sheet of thin grained paper upon which a drawing is made with a lead pencil. When the paper is removed, it will be found that the ground has adhered to it wherever the pencil was used, leaving the lines exposed. These lines are bitten with acid in the regular way, producing varied depths by stopping out, just as in the regular etching. The principle of printing is the same. The result looks like a pencil drawing or a lithograph.

MEZZOTINT

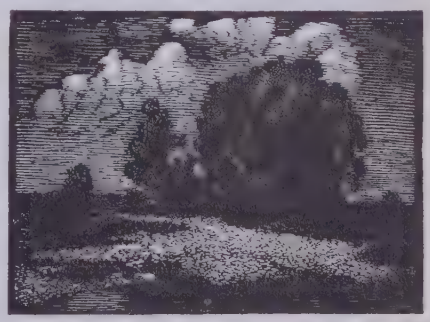
This, also, is a method of engraving in tone, not in lines, but the work is done with tools and without acid. A metal plate is uniformly roughened by means of a toothed instrument called a "rocker," or "cradle"—a method which dates back, as far as records tell us, to 1611. There may be from forty to 120 fine teeth to the inch of the tool. It is rocked in every direction, either by hand or by machinery, to produce tiny indentations with a slight burr on its edge like a shallow vol-

Aquatint

A scene in Coblentz. By Sir Frank Short of London. Considered one of the greatest craftsmen in aquatint and mezzotint, as well as etching.

AQUATINT

The art of engraving upon metal in tones with acid or, as it is technically called, "aqua fortis," produced the aquatint. The result strongly resembles a water color or wash drawing when printed in black or brown, hence the name "aqua tinto," or "aquatint." There are several ways of preparing a ground, the two principal ones being by powdered resin and spirit ground (resin dissolved in alcohol), poured on the plate and allowed to evaporate. There are elaborate devices for spreading dust, such as boxes with a fan to set the dust flying, or screens of cloth through which the dust is sifted on the plate. But simplest of all is to put powdered resin in a small bag of fine mesh which can be held in the hand and which may be struck lightly with a ruler, thus causing the particles to drop. The disadvantage of the latter method is that the particles might not be distributed as evenly as when allowed to settle from the air in a box. The plate must be carefully handled while it is being put on a heater where each grain of resin is crystallized, forming a hard but porous surface. Where no color on the plate is desired, the highest lights are painted out with stopping out varnish, and succeeding steps are followed as in biting etched lines: short intervals for shallow spaces, and longer intervals for deep ones. The removal of the ground, and printing, is the same as with etching, except that the tiny sections of copper that stand up will not yield as many impressions as the depressed lines. Aquatint is capable of many gradations of tones, and represents the painter's point of view rather than the etcher's. To lovers of etching it is less popular than the pure line, which requires more understanding.



canic crater. When the ground is completely covered with dots, the process may require as many as eighty rockings in all directions. If inked and printed, the result is a rich solid black surface. The object is to let the light through this dense black and to outline the subject, which is done by means of a bayonet-shaped scraper and a burnisher. Where a clear surface is desired, all indentations must be removed and the surface polished with a burnisher; this takes the plate back to its first state. From this point to the deepest, blackest shadows, it is a question of controlling the scraper in the leveling process in producing varying gradations of tones. The complete result, when inked, wiped and printed as already described, is the richest combination of light and shade that can be produced. But like drypoint, which depends upon burr for its richness, and like aquatint, which has shallow indentures, the yield of proofs is limited. Were it not for an invention called "steel-facing," which has been in use about sixty years, much of the fine work would have been limited to very few proofs. Steel-facing consists in laying on the copper plate a thin film of steel (by electroplating methods) which protects the soft copper and preserves a uniformity of excellence in the prints for the edition which the artist determines. Without steel-facing, the plate itself determines the number of proofs that may be taken; for as it wears and loses its fine values, it is no longer printable and should be canceled or destroyed.

ENGRAVING

When the word "engraving" is mentioned, most hearers unconsciously add the word "steel," because it seems difficult to disassociate the two. All engraving work previous to 1820 was on copper, but finding that metal too soft for large editions, steel was used for a while. When a process was discovered which would harden the surface of copper, engravers went back to it.

This is the oldest of the intaglio processes. It originated in the fifteenth century with the work of goldsmiths, who cut designs in gold and silver plates for ornaments called *nielli*. In filling these lines with a black substance so that the design might be seen more clearly, the engraver found that an impression could be made on paper. This discovery eventually developed into engraving for the sake of the picture. From a mere record of a design, engraving passed into an art which became lucrative for the translation and interpretation of paintings and other work. The creative work of the artist lapsed into laborious and tedious copying which, although resulting in superlative technique, furnished the world, except in a few notable instances, with no masterpieces. For the whole interesting history of the art, students must consult special books on the subject. It will have to suffice to explain in the briefest way, how engravings are made.

If a design to be cut is first put upon the copper plate, each artist has his own way of doing it. The lines themselves are carved with a tool called an "engraver," or "burin." It is a steel rod about four inches long, lozenge-shaped and sharpened by being cut obliquely at the end. The wooden handle is shaped like half of a mushroom to fit the palm of the hand, while the rod is held between the thumb and second finger and is pushed forward cutting a clear V-shaped furrow without burr. Such a laborious method cannot approach the etched line in its freedom and spontaneity; it results in stiffness and formality. Stipple engraving makes use of dots instead of lines, although it is sometimes used with the line. The printing of engravings, in principle, is like that of all metal

Woodcut

Clump of trees. This woodcut is by J. J. Lankes, an American.

intaglio plates. It is done with a view to keeping the lines clear, and employs less tone than does etching.

WOODCUTS

Broadly speaking, engraving may be applied to an incision made in any material, but its use has narrowed to that of metal. Hence an engraving on wood is generally referred to as a "woodcut." This classification is further divided into white line and black

line process, the product of the latter being designated as a "block print." All previous methods have been intaglio process on metal plates; that is to say, what is to be printed is indented. Now we deal with wood, and what is printed is in relief, or stands up with the indentations not printed.

The oldest and simplest process known is that of carving on wood and printing, first by hand, later by machines. The tools used are knives and the engraver, or burin. The block of wood (usually boxwood) is sawed across the grain, the design is drawn upon it, and outlines of the subject are cut out as white lines on a black surface.

Block Prints. In block prints the wood is cut the length of the grain and the black line stands up to be printed. This is the method used for Japanese prints and is the one best adapted for color. In the latter case a block

Woodcut

The scene is of La Montagne Sainte Genevieve. This woodcut is the work of the great French artist, Auguste Lepere.

is made for each color, and the designs superimposed. The artist draws a design on very thin paper which is pasted, face down, on the block. With knives and gouges, lines are cut standing up with sloping sides like dikes, to give solidity, and large spaces are gouged out more deeply to avoid printing. At each of two opposite corners, for registering, there is a triangular mark which the Japanese call *kento* (meaning "to aim at"). The damp paper, all cut the same size, is fitted to these marks and laid on the face of the block which has been charged with color by short brushes. Over this is gently rubbed a flat disk, about four inches in diameter, called a "baren," which presses the paper to the block and absorbs the color. This may be followed by any number of blocks until the color scheme is completed. And last of all, or it may be first, using India ink, is printed the outline, called the "key block," which ties the subject together. This is the

Block Print

Bridge in Winter. By B. J. O. Nordfeldt. In the manner of the Japanese, who carried the art to its highest perfection.

method used by the Japanese who have carried the art to its highest perfection. Today there are many variations in methods and printing in which machines play a part.

LITHOGRAPHY

Metal plate lines are in intaglio; wood, in relief, and now we come to printing from the surface, or plane, in lithography. A lithograph is a crayon drawing on stone, done in the manner of a crayon or charcoal drawing on paper, the difference being that by means of a printing press and inking, the drawing on stone may be multiplied as it is in etching and engraving. The stone is a form of calcium carbonate cut in slabs two or three inches thick. The best stone comes from Solnhofen, Bavaria. The crayon is composed of a greasy substance which sinks into the stone wherever it is touched by the crayon. When the drawing is finished, the stone is moistened with water. As water and grease do not combine, the parts drawn upon repel the water; parts not drawn upon absorb it. A roller charged with greasy ink is then passed over the surface, and for the same reason the ink is repelled by the wet parts and adheres to every part drawn upon. A sheet of paper is next placed upon the stone, which is passed under a heavy roller. The ink becomes transferred to the paper and produces an exact facsimile of the original drawing. These are the principles of lithography, though there are mechanical details connected with the printing of interest only to workers.

It may be well to mention here, since it is often a subject of controversy between collectors of lithographs as to artistic value, that drawings may be made on prepared paper and sent to lithographic printers who transfer them to stone. This process permits the making of drawings in and from places where large and cumbersome stones may not be taken; such, for instance, as the large, drawings of Panama Canal subjects made by one of the best lithographers, Joseph Pennell, deceased. Since the drawing transferred to the stone is exactly as made by the artist, it seems a distinction too fine for general comprehension that the resulting lithograph is any less artistic than the one drawn on the stone itself by the artist.

No other graphic art possesses the immense scope, or has been called upon for such a variety of purposes, as has lithography.

There is no other multiplying medium as sensitive to the artist's touch. The most delicate grays as well as the strongest blacks may be reproduced exactly as the artist made it. It was discovered in 1796 by Aloys Senefelder, a Bavarian, and was introduced into the United States about 1835.

Lithograph

Memories of San Ildefonso. The American Indian of the Southwest, showing houses and in the background a mesa. By C. A. Seward of Wichita, Kansas.

NOTED ARTISTS

FINE ARTS TERMS USED IN ARCHITECTURE, SCULPTURE, PAINTING AND THE GRAPHIC ARTS

Abutment. A lateral support usually for an arch.
Amphitheater. A building with rising tiers of seats around an arena, generally elliptical in form.
Angels. In medieval art divided into nine degrees: Seraphim, Domination, Princedom, Cherubim, Virtues, Archangels, Thrones, Powers, Angels. The Cupid-like angels were introduced in the time of the Renaissance.
Antae. Rectangular pilasters forming the ends of the walls of the cella of a Greek temple, and supporting the extremities of the architrave. A temple of this form was called a temple "in antis."
Applique. Anything in art applied to a background.
Apse. A projecting part of a church, generally semicircular in form and surmounted by a semi-dome.
Arabesque. An ornament composed of stems, foliage, leafage of plants, scrolls and fantastic animals. Not, as the name implies, an Arab invention but found in Greek and Roman architecture. Also any design of interwoven flowing lines.
Arch. A curved structure, generally a segment or segments of the circle. Semicircular arches were used by the Romans; horseshoe arches by the Byzantines and Moors; pointed arches formed of two intersecting segments of circles by the Gothic builders.
Architrave. Lowest member of entablature.
Archivolt. Molding decorating face of arch.
Ashlar. Smooth pieces of stone laid up to form a wall.
Atlantes. Human male figures, employed instead of columns to support the architrave.
Atrium. A covered court in a Roman house, with an opening in the center (compluvium) and roof sloping inward.
Attic. Upper story or order in a Classic composition.
Baldachino. A canopy over seats and other places of honor.
Baroque. Bizarre, fantastic; a term applied to a style of art in the late sixteenth and seventeenth centuries.
Base. Member on which a column shaft rests. Upright architectural cylinder.
Basilica. A rectangular hall divided by rows of columns into three naves, and used by the Romans as a court of justice; adopted as the typical form of early Christian churches.
Bas Relief (Basso Relievo). Figures sculptured on panel projecting less than half their proportions from the surface.
Body Color. Opaque color.
Buttress. A piece of wall built at right angles to the wall of a building to strengthen the structure, either immediately against the wall or connected by an arch called a "flying buttress."
Byzantine. The style of architecture and painting in use at Constantinople from the sixth to the twelfth century.
Cameo. Design carved in relief against a background of a different color.
Campanile. A high slender tower, Italian in form.
Cartoon. A preliminary drawing for a painting.
Cartouche. An architectural ornament composed of a plain center in an elaborate frame.
Caryatid. Female figure, employed instead of a column to support the architrave.
Cast. The result of pouring molten metal or other material into a mold.
Cella. The internal part inclosed by the walls of a Greek or Roman temple.
Chancel. Part of a church, containing choir and apse.
Chevet. A form of apse inclosed by an arcade with a series of chapels around it, common in Romanesque and Gothic churches in France.
Chevron. A V-shaped ornament.
Chiaroscuro. The distribution of light and shade.
Chryselephantine. Made of or adorned with ivory and gold.
Cinquefoil. An ornamental foliation, consisting of five projecting cusps.
Classic. Art of, or based on that of, Greece and Rome.
Clerestory. Upper portion of church above the aisle roof.
Cloister. A quadrangular covered walk, forming a portion of a monastic building.
Clustered Column. A pier formed by a number of shafts clustered together, either united or separate.
Colonial. The art of the American colonies and early republic, eighteenth century.
Color Etching. A print in color from an etched plate.
Column. A pillar with base, shaft and capital.
Composition. The studied relation of parts in a design.
Console. In architecture, a bracket.
Cornice. Top member of entablature.
Corona. A crown molding; a cymatium.
Craftsmanship. Technical skill in any art.
Cruciform. Like a cross in form.
Crypt. A subterranean chapel beneath a church.
Cusp. Pointed foliation in architectural tracery.
Cymatium. A crown molding; a corona.
Damascened. Metal ornamented by inlaying another metal.
Decorated. The second of the pointed or Gothic styles of architecture in England.
Dentil. Ornament like small cubes in a cornice.
Design. An arrangement of line, color or material to give a desired effect.
Dolmen. A monument of prehistoric stones set up for unknown purposes.
Dome. An arched roof, usually circular in plan.
Dormer. A gable window in the sloping side of a roof.
Encaustic. Method of painting with pigments combined with heated wax.
Engraving. A print from a metal plate engraved with sharp tools.
Entablature. Horizontal superstructure resting on tops of columns, composed of architrave, frieze and cornices.
Entasis. Slope in contour of a column.
Exedra. Curved seat of stone.
Façade. The front side of a building.
Fan Tracery. Elaborate carved work spread over an arched surface.
Fenestration. A system of window openings.
Fillet. A plain band used in architecture to separate ornaments and moldings.
Finial. An ornament of carved work representing foliage on a pinnacle or spire.
Flamboyant. The style of French architecture peculiar to the fifteenth century, contemporary with perpendicular in England.
Flèche. Small thin spire.
Flute. Small semicircular groove or channel cut in the shaft of a column or a pilaster.
Foreshortening. The apparent shortening of an object by viewing it in front.
Fresco. Method of painting on wet plaster with pigments mixed with water; also a painting so executed.
Fret. An angular, interlaced architectural ornament.
Frieze. Middle member of entablature.
Gargoyle. A grotesquely carved water spout, often used solely for ornamentation.
Genre. A subject dealing with everyday life.
Georgian. English and American architecture of eighteenth century; Colonial.
Gesso. A prepared plaster used as a ground for painting or making reliefs.
Gothic. Art of Europe of the twelfth to fifteenth centuries, or the style or architecture that employs the pointed arch.
Gouache. Water color mixed with white body color.
Graffito. Design usually in plaster obtained by scratching through one layer to that of another color.
Grisaille. A style of painting in gray by which solid bodies are represented as if in relief.
Groin. The angular curve formed at the intersections of a vaulted roof.
Guttae. Small drop-like form hanging from triglyph.
Half Timbered. Visible timber framework filled in with plaster or brick.
Hatching. Covering with fine crossed lines.
High Light. The brightest point in a picture.
Historiated. Ornament with some pictorial character instead of pure design; historiated initials in illuminated manuscripts.
Hypostyle. A roof supported by columns.
Impasto. The thickness of the body of pigment laid on to a painting.
Inlay. A design made by pieces of different color set into the same or another material with a flush surface.
Intaglio. An incised design, usually in gems.
Intensity. Strength of a color compared with neutral gray.
Keystone. Outer stone put last in place in an arch ring.
Klaft. A royal Egyptian headdress forming a kind of hood and terminating in two flaps which form over the breast.
Lancet. A pointed arch, high and thin.
Lantern. A small turret above the roof of a building having windows all around it.
Lierne. Thin stone decorative rib in a Gothic vault.
Lintel. The stone or beam placed across the top of a door or window.
Lithograph. A print from an engraved stone.
Loggia. The gallery or corridor of a place.
Lotus. A water lily. In Egypt it is held very sacred.
Mansard. A steeply sloping attic with a flat roof.
Marquetry. Inlaid work of ornamental woods and stones of various colors.
Medallion. A circular or oval tablet on the face of a building.
Medium. Vehicle or liquid with which pigment is mixed, such as water, oil, egg, wax. Also any material of a work of art such as stone and wood.
Metope. Square space, often carved, between triglyphs in an entablature.
Mezzanine. A low or intermediate story.
Mezzo Relievo. Sculpture in relief in which half of the figure projects.
Miniature. A painting in color in an illuminated manuscript. Also any very small painting, especially on ivory.
Model. Something which is copied. To fashion or shape, as in clay or wax.
Modillion. A bracket beneath a cornice.
Monolith. Composed of one stone.
Mosaic. A design composed of small stones or other material of different colors.
Mural. A painting made on a wall.
Mutule. Bracket-like form beneath a Doric cornice.
Narthex. The vestibule of a church or basilica.
Nave. The middle part or body of a church from the choir to principal entrance between the aisles.
Neolithic. New or later Stone Age.
Nimbus. A halo or circular disk around the head of sacred personages.
Obelisk. Tapering stone shaft, square in section with pointed top.
Ogee. An arch described with four centers so as to be concave in lower and convex in upper part.
Order. A division of Classic architecture denoted according to the character of its columns, as Doric, Ionic or Corinthian.
Oriel. A projecting angular window, generally triangular or pentagonal in shape.
Ornament. Decoration.
Ovolo. A convex molding much used in Classic architecture.
Pagoda. A towerlike, storied structure, usually a temple, of the Orient.
Palaestra. A place for wrestling, formerly part of the gymnasium.
Paleolithic. Old or ancient Stone Age.
Palette. A thin wooden plaque on which paint is placed to be used; the set of colors that a painter uses.
Panel Painting. Painting executed on a wooden panel.
Patina. The fine skin or color which age gives.
Pediment. A triangular crowning of a portico usually supported by a row of columns.
Pendentive. Spherical triangle occurring between supporting arches and the bottom of a dome.
Peristyle. A system of roof-supporting columns about a court or building.
Perspective. The art of representing on a flat surface the appearance of objects from one given point of view.
Pier. A square-shaped column.
Pilaster. Square pillar on a wall partly imbedded in it, less than one-fourth of its thickness projecting.
Pinnacle. A small spire.
Piscina. A stone basin in a church.
Plinth. A pedestal.
Polychrome. Of many colors.
Pronaos. The portico situated in front of a temple.
Propylaeum. Entrance to a temple or an enclosure.
Pylon. High rectangular Egyptian structure on either side of temple entrance.
Quatrefoil. An ornament in pointed architecture, consisting of four lobes, or foils.
Quoin. One of projecting blocks alternately long and short, on the corner of a building.
Relief. Projection.
Renaissance. Rebirth. The art specifically of the fifteenth century. The era between the fifteenth century and the World War.
Rococo. Florid ornament, eighteenth century.
Romanesque. Round, arched architecture of Europe between the sixth and twelfth centuries.
Rose Window. Circular window filled with geometrical tracery.
Rubble. Rough stones and broken bricks, used to fill up between walls.
Rustication. Hewn stone masonry, the joints of which are rendered conspicuous by grooves or channels.
Sarcophagus. A stone coffin.
Scumbling. Rubbing or dragging paint lightly over a painted surface.
Shade. Shadow, lack of light or variation in color.
Sizing. A preparatory coat of thin glue.
Sketch. A rough or hasty preliminary drawing.
Soffit. Underside of beam or arch.
Spandrel. The wall space between two arches.
Sphinx. Egyptian figure with a human head on a lion's body.
Stele. A Greek upright carved slab.
Stencil. Oiled paper with openings through which paint is applied to a surface.
Still Life. Painting of inanimate objects.
Stipple. To paint by daubing instead of by working.
Stone Age. Age when stone only was used for tools or weapons.
Stylobate. Continuous basement supporting columns.
Taenia. A band which separates the Doric frieze from the architrave.
Technique. Method of working in any art.
Tempera. A method of painting with pigments mixed with egg.
Texture. The markings or quality of a surface.
Torso. The trunk of the statue of a human figure.
Tracery. Decorative stone divisions in a Gothic window.
Transept. A transverse nave, passing in front of the choir and crossing the longitudinal nave of a church.
Trefoil. An ornament of three lobes or foils.
Triforium. Small story in a church between nave arches and clerestory.
Triglyph. An ornament, consisting of three flutings or upright groupings, separating the metopes in a Doric frieze.
Triptych. A form of pictures in three panels.
Truss. A combination of wood or metal members arranged in triangles to span large spaces.
Tympanum. The triangular space between the horizontal and sloping cornices. The name is also given to the space included between the lintel of a door and the arch over it.
Value. The amount of light in a color. A light color is of high value; a dark color has a low value.
Values. The effect of an object in nature on art relative to other objects in the same view.
Vault. An arched ceiling or roof of stone.
Vehicle. Water or oil mixed with pigment to make it applicable.
Volute. A spiral scroll which forms the chief feature of the Ionic capital.
Voussoir. Any one of the radial stones composing an arch.
Water Color. Color mixed with water as a vehicle.
Woodcut. A print from a wooden block cut out to form the design.
Zoöphorus. (Literally, "bearing animals.") A continuous frieze, decorated with figures of animals, conventional and real.

Egyptian Musicians

The three priestesses at the left are carrying sistra. In the center is shown a sistrum, nine inches high, from the Berlin Museum. The procession of men and women at the right are singing to the lyre, double-pipe and harp.

MUSIC

MUSIC has been called the "Universal Language," for of all the arts, it is the one which speaks most directly to and from the human heart. Everyone loves to sing, and even among the most barbaric peoples a response to rhythm is an outstanding characteristic. Yet in the history of civilization, music is the last of the arts to reach its development. This is probably because architecture, painting and sculpture are "visible arts" and our eyes have been trained to see far more than have our ears to hear. Moreover, these visible arts leave a permanent impression, while every time the greatness of music is to be felt, its message must be recreated. Therefore we have come to regard music as something understandable only to those who have been technically trained to interpret its message. And this is one of the very greatest mistakes which the present day civilization has made regarding any art. Music should be a part of the life of everyone, for it brings greater happiness than any other art expression.

In days gone by musical education for everyone was demanded, and at certain great periods in the world's history, such as the "Golden Age" in Greece, music was of such importance that it was one of the two studies listed in the curriculum for the education of the Greek youth. During the Elizabethan Era in England anyone unable to read music at sight, to sing or to play on some instrument, was considered an illiterate. That is why there is such a constant reference to music in all of Shakespeare's works.

Music, being a natural art, should therefore be easily understood; for its simple and direct appeal is felt by all.

THE THREE PARTS OF MUSIC

Music is made up of three component parts (1) rhythm, which is the pulsation of accented groups of tones; (2) melody, which is the tune or air developed from the use of higher and lower contrasting tones in some definite series of rhythmic progressions; and (3) harmony, which is the grouping of related tones when they are heard simultaneously. Every musical composition is dependent on all three of these elements, although one may overshadow the others. This frequently does occur in certain compositions. In a rapid and fiery folk dance the rhythmic element is particularly discernible, while in a simple bright little folk song it is the melody which makes the most immediate appeal. Yet often, too, it is the harmony that gives the true beauty to the musical message.

When we listen to Negroes singing their marvelous spirituals, we feel the true beauty of their harmonies; while as we hear their rapid syncopated dances, we realize how great is the power of rhythm. Yet rhythm, melody and harmony are to be found in both the dances and the spirituals.

EARLY HISTORY OF MUSIC

Primitive Music. There is in the world little primitive music which has not been influenced by the white man's civilization. In some of the tribes of darkest Africa drum beating, which is the earliest type of music, is still in use. Our first instruments were those used only to accent rhythm. Through the use of drums not only were warlike passions aroused but actual messages were, and still are, communicated from one tribe to another in a sort of musical telegraphy.

The drums were later supplemented by wind instruments made of the horns of animals. Horns were made more durable in later days by being cast in metal. The use of these instruments, with the drums, was confined almost exclusively to war. For the gentler side of life—home, pastoral joys and love—the wind instruments made of reeds were the most popular. The last development was of a rude type of stringed instrument, which was used with the wind instruments and small drums to accompany recreational dances.

The history of music is almost identical with the development of civilization; for, like the other arts, music reflects the age in which it was created.

Procession of Assyrian Musicians
(From the ruins of Nineveh)

Music of the Ancients. We know but little of the ancient peoples save as their civilization has been reflected in their visible art. On some of the gigantic stones, which are our chief clues as to what Assyrian civilization must have been, we find carved outlines of many men marching, carrying instruments of the percussion type, drums and cymbals. Some have wire stringed hand harps with metal janglers, and others blow on long trumpets.

Egyptian Music. On Egyptian wall paintings there are figures playing on huge, many-stringed harps, or blowing on long double pipes; some are carrying small stringed instruments.

We know from these art fragments that the Assyrians were a warlike race, using their music as an incentive to their martial activity, whereas the Egyptian instruments prove that on the banks of the Nile lived a pleasure-loving, sensuous race whose music was used chiefly for recreation and enjoyment. And history tells us exactly the same thing.

The Egyptians possessed probably the earliest science of music; it dates from 3000 B.C. Their music was closely associated with their religion. The harp was their favorite instrument, and was used both for religious services and for social diversion. The Egyptians had many varieties of harps, ranging from the small hand harp to the huge temple harp of twenty-three strings. Hand drums were used to accent the rhythm, but large drums and brass instruments were employed only in time of war. The Egyptian sistrum was frequently copied by both the Hebrews and the Greeks. It was a horse-shoe-shaped metal bar with janglers which rattled as it was held in the hands of the dancers.

Hebrew Music. It was from the Egyptians that the Hebrews obtained their great knowledge of the science of music, although the love of the art is inborn in the race.

The Hebrews left no record of any art, for they believed literally that graven images should never be made. Yet their music has come down through the centuries practically untainted, and the orthodox Jewish chants are the oldest music in the world, constituting the connecting link between ancient days and the present age.

There is frequent mention of music throughout the Bible, although it must be remembered that the translators naturally used the names of instruments they knew; for at the time of King James little research in ancient art had been made.

The Psalms were originally sung with musical accompaniment. It is certain that the Hebrews possessed a knowledge of musical therapy, for this fact is proven by the story of the great influence which David's harp playing had over the wicked King Saul.

King Solomon, in his magnificent temple, had music worthy of his faith. Josephus tells of 200,000 silver trumpets, of the same number of resplendent coats worn by the Levite priests who led the immense choruses, and of 40,000 harps and psalteries which belonged to King Solomon's musical collection.

The earliest instrument of the Hebrews was the ram's horn trumpet, known as the "shophar," which is still used in Jewish temples on holy days. The cantor, who occupies the next important place to the rabbi, leads the singing, the congregation responding and answering his phrases in a manner known as "antiphonal chanting." Many of the antiphonal chants still used in Jewish synagogues date back to early times. This form of church chanting was borrowed from the ancient Hebrews by the early Christians, and is still used in the music of the Roman Catholic and Episcopal churches.

MUSIC AMONG THE GREEKS

Legends Regarding Music. The earliest Greek legends regarding music prove that it was from the Egyptians that the Greeks first learned of the power of tone. While walking on the banks of the Nile, Apollo found the tortoise shell with its dried sinews so stretched across the empty shell that they vibrated when plucked with the fingers. From this gift of Nature, Apollo made his first four-stringed lyre. Later the lyre became an instrument of seven strings said to represent the seven gates of Thebes.

The creation of wind instruments is told in the delightful story of Pan and the nymph Syrinx, while in the legend of that remarkable contest between Apollo and Marysas, the son of Pan, it was forever proven that stringed instruments were more powerful and more important than wind instruments.

In the stories of Orpheus we learn of the first virtuoso, or artist musician; for it was Orpheus who charmed stones and rocks, as well as beasts, with his wonderful music.

The Greek Science of Music. The earliest epic poetry of the Greeks was accompanied by music, and the study of the art was considered of the utmost importance. The science of music, originally learned from the Egyptians, developed marvelously in Greece. When the Pythian Games were established in 1000 B.C., musical contests were included; but it was not until the fifth century B.C. that great names became actually associated with music. Terpander, Pythagoras and Arion were but a few of those who had definite theories about tonal vibration, while among the leading poets and dramatists of the time, music was in constant use.

The later Alexandrian period was, like the Roman days, merely a copying of the great art that had preceded it.

The Greek scales were based on four tones, the original four tones of the early lyre. This scale was known as the "tetrachord." It existed in several forms, for in certain parts of Greece the half tone came between the third and fourth tones, as it still does in our major scales, while in other places it was found between the first and second or between the second and third. When additional strings were added to the lyre, a seven-toned scale came into being. Sometimes these double tetrachords were made by simply doubling the original four-toned scale as is the case in our major scale. But sometimes the first tetrachord was followed by a different one; that is, the first four-note scale might have the half tone between the first and second notes, and it might be followed by another having the notes combined in exactly the same way; or the second tetrachord might have its half tone in a different place from that found in the original tetrachord. This gave to the Greek scales, or "modes," as they were called, a great variety of tonal expression; and it is the very reason why many of the ultra-modern composers are now returning to the use of the old Greek scales.

Instruments. The Greeks favored stringed instruments, such as the lyre and the cithara. They also used the long flute, or auloe, in both a single and a double variety; and the syrinx, or Pan's pipes, a mouth organ of seven reeds bound together. They had few percussion instruments, those in use being tambourines, cymbals and sistra. The Greeks rarely used trumpets or brass instruments, although these became popular in Roman days.

Dances and choruses were important parts of the Greek theater; in fact, the first actors on the Greek stage were the chorus leaders who sang their lines to the accompaniment of the lyre.

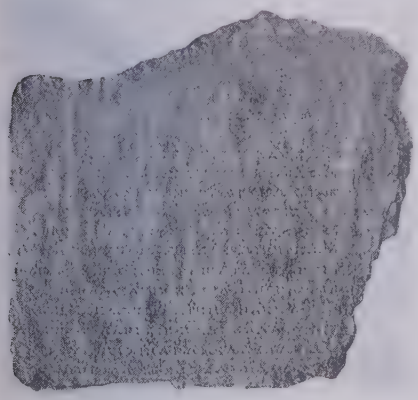
Notation. The Greeks had a method of writing their music, engraving the words on stone with letters above them to indicate the pitch. It was from the system of the Greeks that the early musical notation of the Christian church was developed.

ORIENTAL MUSIC

In the Far East the same music has been in existence for many centuries, and each country has many legends regarding music. All the music of China, Japan and India is of great antiquity, some dating back to 1500 B.C. This Oriental music sounds strange to our ears because we have been trained to hear certain harmonic progressions which are very different from the Oriental ideas. Our scale is formed of seven tones which are divided into whole and half notes. The Oriental peoples have many different types of scales, many tones being divided into quarters and eighths, so that often there are as many as twenty-two tones in a single scale. The rhythmic accent is also a striking characteristic of this music, and in this respect it is very different from ours. Oriental musical science has influenced our modern music but little. Some lovely airs came into the Western World at the time of the Crusades and when the Saracens invaded Sicily and Spain.

In the modern Russian school of music, many composers have naturally been influenced by the beautiful Oriental melodies of their neighbors.

The Music of India. Brahmanism is founded on music, and all Hindu music is closely allied to religion. Every Hindu scale, and there are over seventy, has its own attributes and is used to depict such emotions as love, hate, anger, peace and fear. Some may be used only at certain hours, others at particular seasons or on certain days of the week. The most popular instruments in India are the *vina* (a guitar-like instrument with gourd resonators and metal strings) and the flute.



Apollo and His Lyre
Illustrating a primitive form of the lyre.

Chinese Music. The music of China is also closely affiliated with religion. Confucius declared that one could tell from the music of a people whether they were moral and well governed. The Chinese have always preferred percussion instruments, and their orchestras consist of sixteen varieties of drums, gongs and bells, and of only four types of wind and stringed instruments. The most popular Chinese instrument is the *cheng*, which looks like an old-fashioned teapot, into

which bamboo pipes have been fitted. The player blows through the spout and the air, vibrating in the tubes, produces the tones. The *kin*, the best-liked stringed instrument, resembles the medieval lute. The *che*, an elaborately developed zither, is extremely popular.

The Music of Japan. Although the Japanese have adopted many of the Western customs regarding music, they still consider it an important part of their religion. Many of their instruments are similar to those of the Chinese, and undoubtedly both have come from the same source. The most favored instrument in Japan is the *samisen*, a small guitar resembling the Chinese *kin*, while the Chinese *che* is reproduced in the Japanese *koto*. The Japanese are partial to descriptive music, and many of their songs are accompanied by imitative and humorous effects.

Arabian Music. Of all Oriental music, that of Arabia sounds most familiar to our ears. It is a blending of the music of Persia, Armenia and Egypt; and it was this music which the Crusaders knew, and brought home to Europe. It was also from Arabia that we obtained many of our musical instruments. The Arabian *ooud* became the medieval lute, which is the ancestor of many folk instruments like the guitar, banjo, mandolin and the balalaika. The Arabian *rebec* became the modern violin. To the accompaniment of the pipes and the *rebec*, with castanets, tambourines and hand drums to accent the rhythm, the Arabian dancers of the Moorish invasion left an indelible impression on the music of Italy and Spain.

Hymn to Apollo
One of two stones engraved with the hymn in the old Greek notation. Found on the island of Delos.

FOLK MUSIC

The first musical impulse in every nation springs from the folk, and it is natural to look to folk music for the germ of all that later will be found in the great musical compositions of every nation. Yet in considering folk music, there are several points to remember.

First, there is the influence of actual geographical conditions. All dwellers in the mountains lift or lower their voices in song to correspond to the peaks rising above them, while those on the vast plains show a monotony in their songs quite as apparent as that of the landscape; and people living by the sea reflect the rocking of the waves in the rhythm of their songs.

Second, there is the difference in racial characteristics. For example, all the music of the Slavic race has points of striking similarity, whether it be found in Russia, Poland, Serbia or Czechoslovakia. The fiery music of the Slav is in direct contrast with the more stolid plodding type of Teutonic music found among the German and Scandinavian peoples. All Latins, whether they live in Italy, Spain, France or Rumania, show similar musical characteristics, and their music is unlike that of the other races. Interesting examples of racial similarity are to be found in the music of Scotland and Ireland, for both these lands have inherited many melodies from the Gaelic race. The folk airs of the Welsh and of the people of northern France are similar, which is not strange when one recalls that both are of the Celtic race. Probably the most striking instance of racial influence is found in the music of the Hungarians and the Finns, both coming from the Magyar race.

Third, political conditions have influenced the folk music of the world. Thus Germany claims many folk airs belonging to Austria, to Poland, to Lithuania, to Alsace, to Lorraine, to Bohemia and to Switzerland. Russia has usurped many folk airs of the Ukraine, of Georgia, of Poland, of Lithuania, of Latvia, of Estonia and of Finland.

Historical events have left their mark on folk music. Many of the greatest patriotic airs were born during war days.

Five Classes of Folk Music. Folk music is usually divided into the following classes:

(1) Folk Dance Songs, the earliest type of folk music, sung by the people as an accompaniment to their simple games and dances.

(2) Legendary Folk Songs, airs sung for so many generations that the composer's name, if it ever was known, has long since been forgotten.

(3) Composed Folk Songs, usually of a later period; the name of the composer is known.

(4) Patriotic Songs, reflecting a love for native land and a desire to serve it. There are many patriotic songs of the legendary type, though the composer is generally known.

(5) National Compositions, musical works in which folk themes have been used. Sometimes the composer uses folk music from a land other than his own, an outstanding example being the opera *Carmen*, which uses Spanish characteristics, though the opera was written by a Frenchman, Georges Bizet.

A study of the folk music of every land will give one an amazing understanding of geographical and historical facts. Our modern music has been greatly influenced by folk music, and much of the national music of the past fifty years has been founded on nationality.

EARLY CHRISTIAN MUSIC

The history of modern music corresponds to the history of modern civilization since the beginning of Christianity. The early Christians, meeting in their secret chapels in the catacombs, based their chants on music that they knew. Therefore, many of their early chants were similar to those used by the Hebrews, the Greeks and the Romans. No musical instruments were permitted—partly because the Church fathers associated all instruments with the orgies of the Roman emperors, and partly because the Christians' services were held in secret.

Many chants were used by the various sects of the Church in the early centuries. When Saint Ambrose (340-397) became Bishop of Milan, these chants were collected. Desiring great music for his new church, and, anticipating the beneficial influence of music on the "barbarians of the North," Ambrose declared his Chant to be the standard of the

The Antiphonarium
Pope Gregory dictating the *Antiphonarium*.

Church service. It was based on the early Greek scales and was metrical; otherwise little is known regarding it. The collections of Ambrose were supplanted in the sixth century by chants arranged by the order of Pope Gregory (540-604). These are still the established chants of the Roman Catholic church. Gregory established schools for choristers and gave a definite form to the church service. The Gregorian Chants were founded on the later Greek modes, or scales, and were written down in a large book called the *Antiphonarium*, in a notation which indicated where the breath of the singer was to be taken. The Gregorian Chant spread throughout the Christian world, and in the monasteries and convents the science of music began its development.

In the tenth century, Hucbald, a monk of Flanders (840-930), made certain reforms in notation, using parallel lines to indicate the difference in pitch of the various tones. Hucbald believed that all harmonious combinations of tones should be based on the scientific relation of vibrations. A century later an Italian monk, Guido of Arezzo (995-1050), made some important discoveries regarding music and laid the foundation for all study of music since his time. A favorite hymn sung by Guido's choristers was called "To Saint John the Baptist." Noticing that each verse of the song followed the seven natural tones of the scale, Guido took the

Latin syllables of the text: *ut, re, mi, fa, sol, la* and *te* to represent the scale, and taught his singers by a system known as *solfeggio*, which is still in use. Guido used colored lines for his notation and employed the letters C, G and F to indicate each line. From this developed the clef signatures of our modern notation.

All these changes dealt principally with harmony and melody. No attempt to regulate rhythm was made until the thirteenth century, when Franco of Cologne established a system of notation for measuring music.

The Monochord
Guido explaining the monochord to Theodorus. From an ancient manuscript.

By the use of four kinds of notes he made it possible to indicate rhythm through notation. He was also the first theorist to distinguish between duple and triple time, and declared that triple measure represented the Trinity and was therefore the "perfect measure" for all church music.

MUSIC OF THE MEDIEVAL PERIOD

During medieval days, while the science of music was being developed by the monks of the Church, the really joyous folk music was sung and played by the people. The minstrel musicians traveled throughout Europe, recounting tales of adventure and romance to the accompaniment of the hand harp and rude stringed instruments played with a bow.

In France, such musicians were known as "jongleurs" or "jugglers." Often they were in the employ of the lordly troubadours or trouveres, who were gentlemen musicians of noble ancestry.

In Germany, the minstrel knights were called Minnesingers ("singers of love"). During the Age of Chivalry (twelfth and thirteenth centuries), they went to the Crusades and brought back more poetry, beautiful melodies and unusual musical instruments.

Among the lordly troubadours were such men as Richard the Lion Hearted, Thibaut, King of Navarre and Adam de la Halle. The latter, a hunchback of Arras, wrote *Robin and Marion*, and thus was the first person to attempt to tell a folk story through music. So popular were the tunes in this little operetta that several found a place in the church service and were sung for two centuries as a part of the church ritual.

The Minnesingers held their annual contests of song in the Wartburg Castle in Thuringia, Germany. Among the famous men of this order were Wolfram von Eschenbach, who wrote the earliest German legends of the Holy Grail; Gottfried von Strassburg, whose poem, *Tristan and Isolde* is of rare beauty; Walter von der Vogelweide; and Heinrich Tannhäuser. The Minnesingers were immortalized by Richard Wagner in the opera *Tannhäuser*. He received from their poetic works the inspiration for all his later music dramas.

When the nobility went to the Crusades, music passed into the hands of the common people. The guilds of jongleurs were started in France, while those of the Meistersinger (Mastersingers) flourished in Germany. The most famous German guild was that of Nürnberg, whose great poet-musician, Hans Sachs (1494-1576), was the contemporary of the wonderful painter, Albrecht Dürer. The Meistersingers had very strict rules for the construction of their songs, yet they did much to develop a love of beautiful music among the common people.

It was natural that during this period a love of music should spread all over Europe, and many definite schools of composition came into being. When the University of Paris was established (1100), the professor of music was given as high a rank as that of any other. In England, during the thirteenth century, there must have been a very remarkable musical school, for many great compositions date from that period. The most interesting is the old spring song "Sumer is icumen in," which is written in five independent parts in a style known as the "canon."

These schools of music spread through northern Europe, the most outstanding one being that of the Netherlands, which existed from the fifteenth to the seventeenth century. At this period the Netherlands led the world politically and commercially, so it was not strange that art and music should have been of the first rank there. All composed music at that time was written for choruses of singers. In the Gregorian or antiphonal chant, the two choirs answered each other. There then developed a new form known as "polyphonic" (many-voiced), each part having its individual development, but all being worked out by a method called "counterpoint," each voice conforming to the other voices.

In England, during the latter part of the sixteenth century (the Elizabethan Era), there was a great development in all the arts. Music attained such importance that every educated person was taught to sing, or to play on a musical instrument. The singing of simple ditties known as "rounds" or "catches," was a popular sport, those participating not realizing that they were indulging in a type of music which is today considered very difficult of performance.

The large Italian lute was the popular instrument of the nobility. This was a stringed instrument originally brought by the Crusaders from the East. It was exceedingly difficult to play and has become practically obsolete, its place being taken today by the mandolin and guitar.

The virginals, named from Elizabeth, "the Virgin Queen," were the favorite keyboard instrument. They were later superseded by the harpsichord, spinet and clavichord, which were the ancestors of our present-day piano.

In all the great courts of the world, particularly in those of England, France, Spain, Austria and Italy, dancing became more and more the vogue. Originally dances of the French peasants, the minuet and gavotte, became increasingly popular, vying with each other for favor during the seventeenth and early eighteenth centuries.

The minuet takes its name from the dainty small steps of the dancers; it is in $\frac{3}{4}$ time and of a stately, dignified nature. The gavotte took its name from the district in southern France where it was first danced, the people of the Pay du Gaps being known as "gavots." It is in $\frac{4}{4}$ measure, with its accent on the weak beat.

Other dances which became popular during the seventeenth century were the German peasant dance, the *allemande*; the *saraband*, a Spanish dance of Moorish type which the Italians developed; the *musette*, a shepherd dance accompanied by the bagpipes (musettes), from which it took its name; the *rondo* (rondeau), as popular in dance form as it was in verse; and the *gigue* (jig) a lively dance still popular in the British Isles.

Eisenach in Thuringia
The Wartburg Castle where the Minnesingers held their annual contests of song in the thirteenth century. Bach was born in Eisenach.

As these dances were originally folk tunes, they followed a definite three part pattern —dance, trio, dance. This grew out of folk dancing, as it was the custom for the two groups of dancers to alternate. The first group used one air and the second a contrasting theme, both then dancing to the original tune. As the second group was always accompanied by three instruments, the name "trio" was given to this section.

Some folk dances have only two parts, but the most used dance form was the three part pattern.

BIRTH OF OPERA AND ORATORIO

Meanwhile, as the science of music had developed great choruses and the folk were using instruments more generally, there appeared a great new musical form which combined the choruses, individual voices, instruments and dances. That form, which we call "opera" today, was first known as "music drama." It was born in Florence at the end of that great period of artistic development, the Renaissance.

At the close of the sixteenth century a group of Florentine noblemen, who were interested in restoring to the world the ancient Greek drama, decided that there must have been musical accompaniment to these early dramatic works. Because these men met in a room at the home of Count Bardi, they called themselves *the camerata* (*camera* being the Italian name for "room"). Two of the noblemen—Peri, a poet, and Rinuccini, a musician—produced in 1597 a work called *Dafne* in which the music, the drama and the interpreters were considered of equal importance. This early opera was lost. The first opera which has come down to us is *Eurydice*, written in 1600 for the marriage of Maria de' Medici to Henry the Fourth of France. Scores of this work were printed, and it was sent to all the courts of Europe with the result that interest in this new form, comprising all the arts. naturally grew apace.

In Rome, at the same time that the *camerata* were at work, a pious priest, St. Philip Neri, brought together the young people of his congregation to enact with musical accompaniment certain scenes from the Bible. As these were given in the Oratory of St. Philip's Church, the group of performers were named the "oratorians," and the scriptural music dramas which they enacted were called "oratorios."

Fifteenth Century Musicians

From Memlinc's *Christ and Angels*, in the Antwerp Museum. Executed originally for an organ case. Memlinc was a supreme detailist, and gives us the accurate manner in which these musical instruments were played. The two angels at the left are playing trumpets; the middle figure, a portable organ; next, a hand harp; at the right, a viol.

These two forms spread over Italy. In Venice, where a century before masters from the Netherlands had established a great instrumental school, the orchestra was of supreme importance. In Rome, where choruses were considered as the greatest factors in music, the oratorio was developed; while in Naples, where the art of beautiful solo singing (*bel canto*) had been ever popular, the great solo artists began to appear.

In France, Italian opera featuring dancing and the ballet was encouraged at the court.

In Germany, the Thirty Years' War made expensive productions of opera impossible; but there grew up at this time a great interest in the folk music of those countries engaged in this bloody struggle. The oratorio became a popular form with the German composers, and was used by both the Catholic and the Lutheran musicians.

In England, the early operas were preceded by dramatic works called "masks," which had musical accompaniments. Henry Purcell (1658-1695), who is still regarded as the greatest composer England ever produced, wrote several excellent operatic works.

The First Opera

The first page of the earliest opera, *Eurydice*, written in 1600 for the marriage of Maria de' Medici to Henry the Fourth of France.

In the early eighteenth century, opera and oratorio were the most popular choral forms, while the various dances were being developed by instrumental composers as *entr'actes* for all operas.

GREAT COMPOSERS OF MUSIC

Händel and Bach. The first half of the eighteenth century is dominated by two great composers, Händel and Bach. Born in the same year, 1685, and both Germans, they were the greatest organists and composers of their day. Yet neither ever saw the other nor heard him play, and probably knew nothing of his music.

Johann Sebastian Bach (1685-1750) was born in Eisenach beneath the shadow of the great Wartburg Castle. He was never out of Germany. He was first the court musician for the Prince of Anthalt-Cöthen, where he wrote his early suites and solo instrumental compositions, and later remained quietly at Leipsic as director of music of the St. Thomas Church (Lutheran). Here his greatest choral works and organ compositions were written. It has been said that if all the music written since Bach should be destroyed, it could be re-created on the foundation which Bach left.

The best Bach manuscripts were unknown until the middle of the nineteenth century. His greatest works were his Church cantatas, oratorios, *B minor Mass*, *Passion Music* for choruses, suites for orchestra, organ preludes and fugues, *Well Tempered Clavichord*, studies, concertos and sonatas for violin. He brought the fugue form to its culmination.

Georg Friedrich Händel (1685-1759) is identified not only with the German classical school by reason of birth, but because of education and circumstance is also associated with the Italian and English schools. Händel was a brilliant musician of Hanover who, attracted by the Italian opera, pursued his study in Italy. The form of *opera seria* held sway at this time, and Händel's works were written in that now obsolete form. That, then, is the reason why one rarely hears more than an occasional aria from any of the forty operas which Händel composed. Händel lived for many years in England, where he directed Italian opera. In his later life he devoted his entire time to oratorio, and his greatest works, *The Messiah*, *Samson*, *Saul* and *Judas Maccabeus*, are in this form.

Although a brilliant organist, Händel wrote little for the instrument and left but few orchestral compositions. However, his use of the instruments in his great choral works proves that he had a real understanding of their worth.

The forms in use at the time of Bach and Händel were: the suite, a collection of the old dances preceded by an overture; the serenade, a collection of simple song melodies similar to the suite; the sonata, generally in three movements; the concerto grosso, which was a combination of the sonata and the suite and was written for the orchestra. The orchestra in those days was divided into two

antiphonal choirs—one group being the soloists, the other, the accompanists. The term symphony (from the Latin *sonare*, "to sound") was used to designate any instrumental music in distinction to that which was sung. Shorter forms used at this time were the prelude, the fantasia and the fugue.

Gluck, A Reformer of Opera. In the field of opera in the late eighteenth century, a great and needed reform was brought about by Christoph Wilibald Gluck (1714-1787) who, although an Austrian by birth, was educated in Italy and gave to France her own school of opera, sung in the French language. Gluck realized that the opera had lost much of its true dramatic value through the over indulgence of singers and their desire to display their attainments. He therefore boldly returned to the principles of the *camerata*: that music, drama, interpreter and audience should be of equal importance. His overtures became a part of the musical work, serving to prepare the audience for what should follow; his arias, duets and concerted numbers were dramatically conceived, and singers were not allowed to interrupt dramatic narratives to sing meaningless roulades and trills. Gluck declared that "simplicity and truth are the sole principles of the beautiful in art." He wrote thirty operas of which *Orfeo*, *Alceste*, *Armide*, *Iphigenia in Aulis* and *Iphigenia in Taurus* are the greatest.

Haydn, Father of the Symphony Orchestra. While Gluck was working out the problems of opera, another Austrian composer, Franz Joseph Haydn (1732-1809), was doing a similar service for the orchestra. Haydn is known as the "Father of the Symphony Orchestra," for it was he who divided the orchestra into its present four choirs, grouping the instruments according to their families—strings, woodwinds, brasses and percussion instruments. Haydn established the string quartette, an organization which consists of first and second violins, viola and violoncello (cello).

He established, too, the pattern on which the greatest instrumental music has been built since his day. This is the sonata form, developed from the old forms used by Bach and his son, and by the later Italian composers. Haydn's pattern consists of a short, slow, introduction (sometimes omitted) and a rapid movement developed from two contrasting subjects. These subjects, which are in related keys, are first stated, then repeated, followed by a development which the composer called the "free fantasia," and then restated (both in the same key), after which a short coda, or summing up of the material, brings the work to a conclusion. This sonata form became at once the accepted pattern for the first movement (sometimes the final one, also) of sonatas, trios, quartettes and symphonies, and with slight modifications became the plan for overtures and concertos. The sonata for a single instrument or for any two, the trios, and quartettes generally consisted of three movements. First, an *allegro* or slightly rapid, gay movement, following always the sonata form; second, a slow *andante* or *adagio*, usually in the song form. Occasionally, however, the sonata form or the theme and variations form were used. The third or last movement was in the rondo form. This developed from the popular verse of the day and existed in several patterns, the most used being: theme, first contrasting theme, original theme, second contrasting theme, original theme, first contrasting theme, original theme. The finale sometimes was in the sonata form, and occasionally it was a theme and variations. Often introduced between the second and last movements was a dance movement—generally the ever-popular minuet—always following the regular dance pattern of minuet, trio (contrasting dance), minuet. The minuet was always used as the third movement of Haydn's symphonies, and is found in almost all of his trios and string quartettes.

Haydn wrote nearly 700 instrumental compositions, of which 125 are symphonies, seventy-seven are string quartettes, and thirty are trios (violin, cello and piano). He also wrote a number of operas, now obsolete, and several excellent oratorios of which *The Creation* and *The Seasons* are considered his best. Haydn was the teacher of both Mozart and Beethoven.

Mozart, Musical Prodigy. The first great musical prodigy, Wolfgang Amadeus Mozart (1756-1791), was one of the most spontaneous melodic composers in the history of music. As a boy, this wonder-child, playing both the violin and harpsichord, traveled all over Europe. When he settled in Vienna, he was familiar with every type of musical expression. His genius poured forth a continuous stream of over a thousand musical compositions, many of which were never published. Of his forty-nine symphonies, three—in *G minor*, in *E flat* and *Jupiter*—written in six weeks during the summer of 1788 are considered among the world's greatest works in this form. His sonatas, trios, quartettes and concertos still rank with the highest expressions in those forms.

Mozart's operas have held the stage because of their sparkling melodies and great beauty, despite the fact that Mozart heeded but slightly the reforms suggested by Gluck. Mozart's greatest operas are *Marriage of Figaro*, *Magic Flute* and *Don Giovanni*.

Beethoven, Master of the Symphony. The greatest personality in the history of music was Ludwig van Beethoven (1770-1827), a man whose colossal genius has been frequently compared to that of the mighty painter and sculptor, Michelangelo.

The personal history of this great man was tragic, for deafness came upon him while he was still young and his entire life seems to have been a struggle against fate. It has been the custom to refer to Beethoven as the last of the Classic School, and the beginning of the Romantic; for, while he used the classic forms, he was the first composer to reflect in music his personal feelings. Living at the time when Napoleon was changing the map of the world; when "universal brotherhood" was the cry of all nations, it is not strange that Beethoven's works should have overstepped the formal restrictions of the days of kings and petty princes. Beethoven wrote in all forms, his greatest works being the nine symphonies for orchestra, five concertos for piano, one for violin, the opera *Fidelio*, the oratorio, *Mount of Olives*, the *Mass in D*, thirty-two sonatas for piano alone, nine violin sonatas, sixteen quartettes, and many smaller works for chamber music combinations. He also wrote about 250 songs, of which over 150 are settings of folk songs from Great Britain.

Beethoven's works are regarded as the supreme models of symphonic writing. He brought the sonata form to its culmination, yet he also opened the way to the future by his dramatic use of the orchestral instruments, and through his descriptive music.

Schubert, a Spontaneous Musician. Living at the same time as Beethoven was one of the greatest spontaneous musicians ever known. Exquisite melody flowed from his pen and he wrote in all forms. This great genius was Franz Schubert of Vienna (1797-1828)—a man who, throughout his short life, wrote over 650 songs (including part songs and masses), eighteen dramatic works, twenty-four piano sonatas, twenty string quartettes and ten symphonies, besides a countless number of short instrumental fragments. Many of Schubert's compositions he never heard; they were found after his death by Robert Schumann.

Although all of Schubert's compositions are rarely beautiful, his songs are his outstanding contribution to music. His musical accompaniments are of as great importance as is the voice part in reflecting the dramatic meaning of the text.

Weber and the Romantic School in Germany. Contemporaneous with Beethoven and Schubert was another German, Karl Maria von Weber (1786-1826). *Der Freischutz* (The Freeshooter), Weber's first opera, produced in 1821, gave to Germany her first opera sung in the German language by German singers, telling a German folk story through the medium of German folk music.

It is the custom to speak of this period as the Romantic School, in contradistinction to the Classic School, which had preceded it. In art and literature, as well as in music, the Classic Period was the time when there was reflected in every creative work ideal beauty which followed definite, formal patterns of construction. The Romantic Period was that time when formal restrictions were changed or discarded, in order that the artist might present his individual thoughts in his own way. This individuality in music is generally expressed through program or descriptive music, by the use of national folk music idioms, or by brilliant instrumental passages of such difficulty that only a virtuoso (one possessing rare technique) could interpret them.

Mendelssohn and Schumann. The two greatest composers associated with the German Romantic School are Felix Mendelssohn-Bartholdy (1809-1847) and Robert Schumann (1810-1856). Both were highly educated, refined men who brought their rich background of historical and literary associations to their music. Mendelssohn possessed a greater melodic gift, but Schumann was more dramatic. Mendelssohn wrote in all forms except opera, although his incidental music for Shakespeare's *A Midsummer Night's Dream* ranks with any operatic work. His greatest oratorios were *St. Paul* and *Elijah*. He also wrote four symphonies, seven concert overtures, two piano concertos, a violin concerto, seven quartettes and other compo-

sitions for chamber combinations, eight books of piano numbers known as *The Songs Without Words*, many short compositions for piano and other instruments, and eighty songs, duets and quartettes.

Schumann was not only a great composer but the first great music critic. His praises introduced to the musical world Berlioz, Chopin, Liszt, Wagner and Brahms, besides making known the true greatness of Bach and Schubert. As a composer, Schumann excelled in short but exquisite compositions for the piano. For orchestra he left four concert overtures and four symphonies, beside concertos, sonatas and many chamber music compositions. His opera, *Genoveva*, was not successful; but his incidental music for *Faust* and *Manfred* is still given. Schumann wrote over 200 songs, many ranking with those of Schubert.

At this time a new form, the concert overture, came into existence. It bore a title, and was program music inasmuch as it was descriptive and told a definite story; it was a free adaptation of the sonata form pattern.

Composers of the Romantic School in France. In France, the ideals of romanticism were carried to a far greater extreme than in Germany. The Court of Louis Philippe attracted to Paris all the greatest artists of the day, while the French public, satiated with the horrors of the recent Revolution, demanded that their literature and art should all be extremely sensational. To Paris came the great violinist, Niccolo Paganini (1782-1840), whose dazzling technique laid the foundation for the present-day school of violin playing; came also Franz Liszt (1811-1886), the brilliant Hungarian pianist, and Frederic Chopin (1810-1849), the young "poet pianist" of Poland. The greatest French composer of the day was Hector Berlioz (1803-1869), called by Schumann the "uncompromising champion of program music." Berlioz wrote almost exclusively for the orchestra. He possessed a dazzling virtuosity in orchestral composition, and his uses of the instruments were always startling and unusual. All his compositions were descriptive, and he frequently used a definite theme, which he called "the fixed idea," to designate certain characters. His operas are rarely given today, although his dramatic cantata, *The Damnation of Faust*, is frequently produced in the world's opera houses. His greatest works are his dramatic symphonies, *Episode in the Life of an Artist*, *Harold in Italy* and *Romeo and Juliet*.

Chopin, Poet of the Piano. Frederic Chopin came to Paris from his native Poland in 1831, and his poetic genius attracted the attention of the musical world. With the exception of a few songs, Chopin wrote only for the piano. His two concertos are his largest works. He also wrote four sonatas, but his greatest compositions were his small pieces for his chosen instrument. Chopin was the first great composer to use the folk dances of his native land; and his mazurkas, polonaises and waltzes are among his most popular works. He left nineteen nocturnes, twenty-five preludes, twenty-seven études, four ballades, three fantasias, besides many other short compositions.

Franz Liszt, Dazzling Virtuoso. Franz Liszt, who was a Hungarian by birth, went to Paris to pursue his education as a composer. His pianistic ability attracted such attention that he soon became the center of the artistic group of the French capital, and was recognized as the most dazzling pianist of his day. In 1849 he accepted the position of Court music director at Weimar, and from that time was known chiefly as a composer. Liszt used Hungarian melodies in the same remarkable manner that Chopin had used those of Poland. His fourteen *Hungarian Rhapsodies* are still his most popular works. He wrote with great dramatic intensity for orchestra, all of his works following the lines of program music. His greatest symphonies are based on Dante's *Divine Comedy* and Goethe's *Faust*, while his symphonic poems were inspired by various literary and historical works. Liszt created a new form in the symphonic poem (an adaptation of the sonata form), a work which bore a title and followed a definite dramatic program. There were two main subjects, but these were so developed that frequently the entire character of the work itself was changed. Liszt did much to aid the musicians of his time, and his help to Wagner was chiefly responsible for the development of the Wagnerian music drama.

Writers of French Grand Opera. The French Romantic School brought forward the French grand opera, which supplanted the earlier *opera seria* of Händel's day. Many of the great names associated with this form are of Italian composers, who came to Paris at this time.

Luigi Cherubini (1760-1842) was for many years head of the Paris Conservatory. Gasparo Spontini (1774-1851); Gioachino Rossini (1792-1868), whose *Barber of Seville* and *William Tell* are still popular; Gaetano Donizetti (1797-1848), composer of *Lucia di Lammermoor*, *Daughter of the Regiment*, and *Don Pasquale;* and Vincenzo Bellini (1801-1835), whose *Norma* and *Sonnambula* are the joy of coloratura sopranos, are among the great Italians identified with this school.

The most spectacular opera composer of the day was a German who took the Italian name of Giacomo Meyerbeer (1791-1864). His works were all written to dazzle and amaze. His operas, *Robert the Devil*, *The Huguenots* and *The Prophet* are still given all over the world.

There were also a few French composers of opera at this period, among them being Méhul, Boieldieu, Auber, Hérold and Halévy. Although they wrote excellent operas, these men were completely overshadowed by the more spectacular works of their foreign competitors.

Richard Wagner and the Music Drama. A great change came at the end of the Romantic School through the advent of the mighty Richard Wagner (1813-1883)—a figure who stands in the same relation to the music drama that Beethoven does to the symphony. In his first opera Wagner strove to outdo the French grand opera composers, and *Rienzi* (1842) brought him fame and fortune. But Wagner, while writing this work, realized the dramatic absurdities of this type of expression. He felt that the only right principles for dramatic composition were those which had been held by the Florentine *camerata* and by Gluck in his attempted reforms. In *The Flying Dutchman* and later in *Tannhäuser* and *Lohengrin*, Wagner set forth his amazing new ideas which, although based on principles before attempted, were still new. Wagner used for each character, as well as for many inanimate objects, a definite characteristic theme or leitmotif (leading motive). To make these themes more prominent, each character had his own individual instrument or group of instruments. The overture or prelude was written to prepare the audience for the action which was to follow on the stage, and each act was preceded by its own prelude.

Wagner wrote his own librettos, basing them on great German legends. His greatest works following *Lohengrin* (1850) were *The Ring of the Nibelungs*, a cycle which consists of four operas: *The Rhinegold*, *The Valkyrie*, *Siegfried* and *Dusk of the Gods* (Götterdämmerung); *Tristan and Isolde*, *The Mastersingers* and *Parsifal*.

Feeling that these great works needed an ideal performance, Wagner and his friends, aided by the generosity of Ludwig II of Bavaria, "The Mad King," erected in Bayreuth, Germany, an opera house devoted exclusively to the production of Wagner's works. Wagner used the orchestra in a most striking and unusual manner. His influence on the composers who have followed him is far greater than that of any other writer of music. Every composer since his day has reflected Wagner's principles. This is particularly noticeable in the operas of the great Italian, Giuseppi Verdi (1813-1901), whose early works were modeled after the Italian operas of the period.

Verdi and his Followers in the Modern Operatic School of Italy. In *Rigoletto*, produced the year after *Lohengrin*, Verdi shows a great dramatic power. This opera was followed by the rapid composition of *Il Trovatore*, *Traviata*, *Sicilian Vespers*, *Masked Ball* and *Force of Destiny*—all composed within ten years. His third period produced his greatest works (which clearly show Wagner's influence), and have rightly placed Verdi in the seats of the immortals. *Aïda*, *Otello* and *Falstaff*, the last written when the composer was eighty, are regarded as the most significant Italian operas.

Following Verdi in the modern operatic school of Italy were Arrigo Boito (1842-1918), whose greatest work was *Mefistofele;* Amilcare Ponchielli (1834-1886), with *Gioconda;* Ruggiero Leoncavallo (1858-1919), *I Pagliacci* and *Zaza;* Pietro Mascagni (1863-), *Cavalleria Rusticana* and *Iris;* Alberto Franchetti (1860-), *Germania;* Umberto Giordano (1867-), *Andrea Chénier*, *Fedora* and *La Cena della Beffe;* Giacomo Puccini (1858-1924), *La Bohème*, *Tosca*, *Manon Lescaut*, *Madame Butterfly* and *Girl of the Golden West;* Ermanno Wolf-Ferrari (1876-), *The Secret of Suzanne* and *The Jewels of the Madonna;* Riccardo Zandonai (1883-), *Conchita* and *Francesca di Rimini;* and Italo Montemezzi (1875-), *The Love of Three Kings*.

Of these composers, Puccini was not only the most popular, but the most prolific as well. His works have been successful all over the world. Possessed of a great dramatic gift, Puccini always used broad and beautiful melodies, and his operas are regarded as the most popular works of the modern day.

Italian Instrumental Composers. There was practically no instrumental school in Italy from the seventeenth century until that founded by Sgambati (1843-1914), a pupil of Liszt. Among his followers were Martucci (1856-1909), Busoni (1866-1924) and Bossi (1861-1925). Perosi (1872-) has written great church music in the style of Palestrina. The greatest modern masters of Italy today—Respighi (1879-) Cassella (1883-), Malapiero (1882-), and Pizzetti (1880-)—are chiefly concerned with instrumental development.

Brahms and Absolute Music. Johannes Brahms (1833-1897) was the greatest modern master of absolute music; that is, music in which formal pattern is of greater importance than descriptive program. Ranked with Bach and Beethoven, Brahms is considered as one of the greatest symphonic writers in the history of music. He wrote no operas, his largest choral work being *The German Requiem*. He left many short piano compositions, exquisite songs, quartettes and chamber music, concertos for violin and piano, and four great symphonies.

Other modern masters of absolute music in Germany were: Joseph Rheinberger (1839-1901); Anton Bruckner (1824-1896); Max Bruch (1838-1920); Gustav Mahler (1860-1911); Georg Schumann (1866-1924); Max Reger (1873-1916).

MODERN SCHOOLS OF MUSIC

Modern German Writers. German, writers, who followed after Wagner and Liszt were: Karl Goldmark (1832-1915), a Hungarian by birth; Engelbert Humperdinck (1854-1921), whose *Hänsel and Gretel* is one of the most popular operas today; and Hugo Wolf (1860-1903), who was one of the greatest masters of song writing. A modern German, who has startled the musical world by his disregard of all established rules of form and composition, is Arnold Schoenberg (1874-). His followers, Franz Schrecker (1878-), Ernst Krenek (1900-) and Erich Korngold (1897-), are attempting musical combinations that seem impossible.

The Modern French School. In France, the operatic genius following Meyerbeer was Charles Gounod (1818-1893), whose *Faust* is the outstanding opera in popular favor. Gounod's other operas, except *Romeo and Juliet*, are rarely heard.

Also popular is the opera *Mignon* by another French composer, Ambroise Thomas (1811-1896), whose other works for the operatic stage are not often presented.

Contemporaneous with Brahms in France was César Franck (1822-1890), rightly regarded as the true founder of the Modern French School. Franck wrote in the polyphonic (many-voiced) style of Bach, yet all his compositions were filled with poetic mysticism. His greatest choral work was *The Béatitudes*. He wrote many compositions for piano and organ, exquisite works for chamber music combinations, many beautiful songs, symphonies and symphonic poems. His *Symphony in D minor* ranks with the greatest works in that form.

Franck had many followers, among them being Vincent d'Indy (1851-), Alexis Chabrier (1841-1894), Alfred Bruneau (1857-), Ernest Chausson (1855-1899), and the great organists, Alexandre Guilmant (1837-1911), Théodore Dubois (1837-1924), Gabriel Fauré (1845-1924) and Charles Widor (1845-).

Camille Saint-Saëns (1835-1921) was one of the most prominent of modern French composers. He wrote in all forms, his greatest works being the opera *Samson and Delilah*, and his symphonic poems.

The most unique of modern composers was Claude Debussy (1862-1918), who was the most prominent of those modern musicians who have returned to the old Greek scales and modes. Debussy left many short pieces for piano, exquisite songs, and chamber music compositions. His largest and most important work was the music drama, *Pelléas and Mélisande*. Debussy had many followers in every land, the best French composers who have made use of his principles being Maurice Ravel (1875-), Florent Schmitt (1870-) and Paul Dukas (1865-).

A strange genius of the Modern French School was Erik Satie (1866-1925) who, with Schoenberg and Stravinsky, has utterly abolished past rules of composition. A group of his followers are known as "The Six." Of these strange musicians, Milhaud, Poulenc and Honegger (the latter in his opera *Judith* and with his compositions for orchestra) are attracting world recognition.

The Russian School. The feeling for national expression which came into music with the Romantic School has developed and increased among modern composers of every country. In addition to the existing schools of Italy, France, Germany and England, the last half of the nineteenth century also saw the development of great national schools in Russia, Scandinavia and Bohemia. Of these the Russian School, founded by Anton Rubinstein (1830-1894), is undoubtedly the most important. The early composers identified with the Russian School were men of other professions, who gave up their work for the cause of Russian music.

The first great Russian composer was Michael Glinka (1804-1857) whose opera, *A Life for the Czar*, was the first Russian work in this form. Associated with Anton and Nicholas Rubinstein in the new Russian Schools of St. Petersburg and Moscow were Cesar Cui (1835-1918); Borodin (1839-1881); Rimski-Korsakow (1844-1908); Moussorgsky (1839-1881); Balakirew (1837-1910), and Tschaikowsky (1840-1893). The latter ranks as one of the most popular of modern composers. He wrote in all forms. His operas, *Eugen Onégin*, *Jeanne d'Arc* and *Pique Dame*, are regarded as his best. He left six great symphonies, concertos for piano and violin, many dramatic concert overtures, ballet suites, much chamber music, and many short piano compositions and songs. Like the other Russian musicians, many of his compositions are based on Russian folk songs. He used the orchestra always in a striking and unusual manner, his characteristics being excessive melancholy or extreme gayety. Rimski-Korsakow was a popular, brilliant master of orchestration and had many followers, chief among them being Alexandre Glazounow (1865-1921), Anton Arenzky (1861-1906) and Sergei Rachmaninoff (1873-), a great pianist as well as composer.

One of the most amazing of modern day composers was Alexandre Scriabin (1872-1916) who, in his later years, led an open revolt against all formal restrictions and rules of composition. Followers of Scriabin are Sergei Prokofieff (1891-) and Igor Stravinsky (1859-), the latter being rightly regarded as one of the greatest leaders of present day music.

Other great Russians of today are Ippolitow-Ivanow (1859-), Gliere (1875-), Gretchaninow (1864-), Rebikow (1866-), Medtner (1879-). All of these writers use Russian folk themes, but are also deeply imbued with the most extreme theories of modern tonal combinations.

Modern Music of Scandinavia. The founder of the Scandinavian School of music was Niels Gade (1817-1890), a Dane who was greatly influenced by the Romanticism of Schumann and Mendelssohn. The great Norwegian violinist, Ole Bull, (1810-1880), was exceedingly fond of the folk tunes of his native land, and played them all over the world. He encouraged Edvard Hagerup Grieg (1843-1907) in his musical work, and Grieg became the most popular of the composers of Norway. Grieg wrote no symphonies and but few large orchestral works; yet his shorter compositions for piano and violin, and his many lovely songs, won for him world recognition. The incidental music for Ibsen's drama, *Peer Gynt*, as arranged in two orchestral suites, is Grieg's best-known work. Also popular are his great piano concerto and his sonatas for violin and piano. All of Grieg's works are in the Norwegian musical idiom, and are outstanding examples of modern national composition. Other Norwegian composers are Johann Svendsen (1840-1911) and Christian Sinding (1856-), the latter regarded as Grieg's successor.

Sweden has not yet produced a Grieg, although Sodermann (1837-1876), Sjogren (1853-1918) and Tor Aulin (1866-1914) have all used Swedish folk material effectively in their compositions.

Finland, except by location, should not be linked with Scandinavia, yet its music school is generally classified in this way. An amazing musical personality is found today in Finland in the person of Jan Sibelius (1865-) who, in his great tone poems for orchestra, as well as in his songs and smaller compositions, has imbued all his works with the mysticism and rare beauty of his far-away land. Jarnefelt (1878-) and Palmgren (1869-) are using ultra-modern methods of expression, yet have retained many characteristics of the Finnish folk music.

Bohemian Composers. Czechoslovakia or Bohemia, as part of it was known before the war, has always been regarded as a most musical country, although it has only been in the modern day that this land has possessed its own school of music. Friederich Smétana (1824-1884), a pupil of Liszt, was the first to write a Bohemian opera. His *Bartered Bride* tells a folk tale in the Bohemian language with Bohemian folk tunes. Smétana also wrote six symphonic poems descriptive of scenes in Bohemia and of events in her history.

The greatest Bohemian composer was Anton Dvořák (1841-1904), who wrote in all forms and is regarded as the greatest modern master of national composition. He used

original themes, but always in such a characteristic manner that they seemed to have been born of the people. Dvořák lived in America for several years, and was the first to bring to the attention of the musical world the importance of America's native folk music. His symphony, *From the New World*, is based on American folk music. Dvořák's greatest works are the *Slavonic Dances*, five symphonies, symphonic poems, many charming chamber music compositions and songs. His operas are rarely presented; but his oratorios, *Stabat Mater* and *Requiem*, are frequently given by choral organizations.

Two later Bohemian composers were Suk (1874-1924) and Fibich (1850-1900).

Modern Spanish Composers. A recent group of national composers to attract the attention of the musical world come from Spain. The founder of the modern school in Madrid was I. Albeniz (1860-1909), a pupil of Liszt. He used Spanish folk airs as the basis for his compositions. The greatest talent of his school was Enrique Granados (1869-1916) whose remarkable opera, *Goyescas*, received international recognition. Granados lost his life during the World War when the boat on which he was returning from America was sunk by a German submarine. Manuel de Falla (1876-) is now attracting much attention because of his remarkable ability to combine the folk melodies of Spain with the most extreme principles of modernism.

Modern English Composers. In England the outstanding composer today is Sir Edward Elgar (1857-), who ranks among the greatest of living musicians. Elgar's largest works are the oratorios, *Dream of Gerontius* and *Caractacus*. He has written several symphonies, concertos and overtures for orchestra, as well as chamber music, organ compositions and songs.

An unusual composer was Samuel Coleridge Taylor (1875-1912), an English Negro, who used African and American Negro melodies in many of his works.

Other modern English composers include Sir Arthur Sullivan (1842-1900) who, together with the talented librettist, W. S. Gilbert, gave the world several of its best comic operas—*Pinafore*, *Pirates of Penzance*, *Iolanthe* and *Mikado;* Arthur Goring Thomas (1850-1892), Edward German (1862-), Liza Lehmann (1862-1918), and Granville Bantock (1868-).

A unique personality of the modern English school is Percy Grainger (1882-) who, although born in Australia and now a naturalized American, is using English folk tunes in the ultra-modern manner.

Cyril Scott (1879-), known as "The English Debussy" is a follower of the French master, but he uses English folk melodies. So, also, does Ralph Vaughn Williams (1872-), whose *London Symphony* is regarded as one of the greatest recent works.

Other English composers of today are Frank Bridge, Frederick Delius, Arnold Bax, Gustav von Holst and Eugene Goosens.

American Music. Our music in America is only in its earliest development for, like every other country, we have had to wait until the position of our country as a world power should be firmly established. Since the World War, a remarkable interest in American music is taking place throughout the world. Although all of our greatest musicians in the past were trained in foreign schools or were of foreign birth, we had much native talent here which was unrecognized.

The music of the American Indian is of far greater importance to American music than many of us realize. Each tribe had its own music as it had its own language. The savage tribes, constantly on the warpath, used the drums or tom toms with reiterated rhythms; but among the peace-loving tribes, the flute songs were the most popular, the flute being the most cherished possession of the Indian chief. The Navajos, outstanding lovers of peace, are said to possess more than 15,000 different songs. All the Indian songs have legendary stories, for they recall the important ceremonies and history of the different tribes. Indian mothers sing lullabies to their babies, sometimes using as a refrain the flute love call theme which was sung as a wooing song during the days of the father's courtship. Many tribes have work songs, while the medicine men use songs and dances for the cures for all diseases. Indian themes have been used as the basis of musical works by many American composers, including Charles Wakefield Cadman, Thurlow Lieurance, Arthur Farwell and Charles Sanford Skilton.

The music of the American Negro is more interesting than any other American folk expression. It was but natural that, during the days of slavery, a distinctive musical expression should come into being. All people who are oppressed or denied political freedom reflect in their rhythmic expression their desire for liberty. This breaking-over of rhythmic laws is called syncopation. Singing always binds closely any oppressed people and the high, close harmonies heard when Negroes sing together is an outstanding characteristic of their music. Like other primitive peoples, the Negro always showed his religious enthusiasm by his personal appeal to his Maker, and the Negro spirituals are rightly regarded as the most unique and beautiful "folk songs of sorrow" found in musical literature. There are two types of spirituals: those of the "Lower South" being intensely sad and reflecting the dread of being sold into deeper slavery "down river," while the "Upper South" spirituals are of a happier character, frequently using dance rhythms and reflecting the carefree nature of the Negro whose life on the plantation was a fairly contented one. Negroes have always sung as they have worked, and many of their work songs are characteristic of the occupation of the singers. The dance and play songs are very gay and lively. Among the Louisiana Negroes, many of the songs are tinged with French feeling and Spanish rhythms. Many American composers have used Negro themes and there have also developed, in recent years, a distinctive group of composers of Negro blood, among them being Henry Burleigh and Nathaniel Dett.

Another distinctive folk expression of America is the music of the cowboys. Just as in medieval days, the singing of ballads by the bard or minstrel was the chief entertainment of any large group, so in the old ranch houses, after a hard day's work, the cowboys used to meet and sing songs telling of their various adventures. Some of the airs were old ballad tunes which they had known in their homes in the East; others they made up as they sang. When driving the cattle "over the trail," in search of the fresh, green grass, the chief danger to the cowboys was that of a stampede. In order to quiet the cattle and avert a panic, the cowboys would ride around the herds all night singing to the cattle the "Dogie Songs" or "Cattle Lullabies." To keep the dogies (yearlings) on the trail, the cowpuncher used sharp, rhythmic cries, which developed into a definite type of cowboy song.

Another distinctive type of American folk song is to be found among the mountaineers of the Appalachian range. Many of these were originally old folk songs of Great Britain. Many of the words of these songs were changed by the different conditions under which the singer was living. Also many entirely new songs have developed. The young people of the mountains loved to dance to the old fiddle tunes of their ancestors and many of our simple pioneer dance tunes, like "Turkey in the Straw," "Arkansas Traveler" and others came into being from the old mountain fiddlers.

From the beginning of America's first settlements, music has been coming to our land from other countries, and much of this has been assimilated and made our own. The Puritans did not believe in singing and dancing, and they chanted their hymns and psalms in a monotonous drone. Yet some fine old hymn tunes developed from the Puritans. When the early Scotch and Irish colonists came into New England, they brought their love of song with them.

The first English settlers of Virginia brought their old ballads and their homes were filled with the stately dance-tunes they had known at home. But when the Negro musicians began to play for their masters minuets and gavottes and the gayer country dances, popular in England, the character of these compositions changed most decidedly and became the "Virginia Reel" and the old jig tunes so popular in Colonial America.

The French colonists brought many interesting songs, which are to be found, not only in French Canada, but all through the Great Lakes region and down the Mississippi to New Orleans. When the French Canadian pioneer ventured forth into the wilderness, he was called a "voyageur," and as many of these brave men were identified with America's lumber industry, their songs became identified with the logging camps. The "Voyageur" songs are another important addition to the folk music of America.

Spain made her colonies in America chiefly in the Southwest and in California, and here is to be found another distinctive type of American folk music. This Spanish influence is also to be noted among many of the Indian tribes of the Southwest.

At the time of the American Revolution, the majority of the popular songs of America were those that had come from other lands. One of the signers of the Declaration of Independence, a man who was Washington's legal adviser and helped to make the American Constitution a reality, was Francis Hopkinson (1737-1791); he was also a com-

poser of many excellent songs in the style of his day.

The greatest writer of composed folk songs was Stephen Foster (1826-1864), whose lovely plantation airs are known all over the world.

During the Civil War, the greatest patriotic songs any country has ever possessed became the inheritance of America. George F. Root was doubtless the most popular writer of the day, and his great songs, "Battle Cry of Freedom" and "Tramp, Tramp, Tramp" are still sung and loved. Henry C. Work, Walter Killridge and Louis Lombard also wrote popular favorites. The tune of "The Battle Hymn of the Republic" was originally an old hymn tune written by William Steffe, which many people believe was at first a spiritual. Julia Ward Howe, the great Boston poetess, wrote the verses we now sing to the old air.

Since the Civil War, much of the folk music of the old world has been brought into America by those who have come here from other lands. Our future American folk music will doubtless contain many of the old songs which the immigration of the late nineteenth century brought to us.

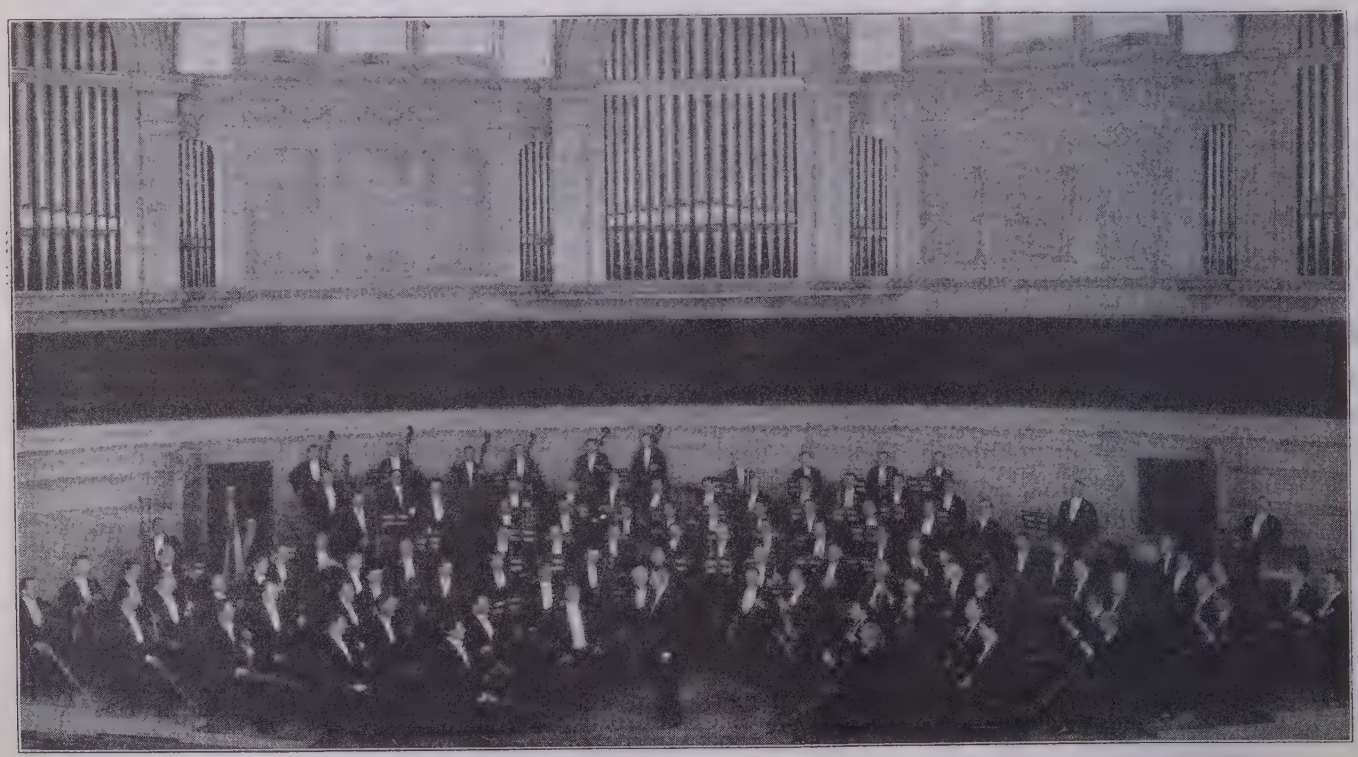
The most individual genius in America's music was Edward MacDowell (1861-1908). MacDowell used both Indian and Negro folk idiom in many compositions; yet in all his works he reflected the highest ideals of true American spirit. His largest works were his symphonic poems, two orchestral suites (one of which is founded on the airs of the American Indian) and his concertos. MacDowell wrote four great piano sonatas, many beautiful songs, and countless short tone poems for his favorite instrument, the piano; but his fame rests chiefly on such poetic and fanciful short piano compositions as the "Woodland Sketches," "New England Idyls," "Sea Pieces" and "Fireside Tales."

It is hard to classify the American composers, for they are many, and we are too near them to recognize their true greatness. To mention but a few of the early school who received recognition in Europe as well as America, we record John Knowles Paine (1839-1906), Director of Music at Harvard University; Dudley Buck (1839-1909), who exerted a great influence on organ playing and choral development; Horatio Parker (1863-1920), the Director of Music at Yale, and George W. Chadwick (1854-), the Director of the New England Conservatory. Edgar Stillman Kelley (1857-), Henry Gilbert (1868-1928), Ethelbert Nevin (1862-1901), Reginald De Koven (1859-1920) and Victor Herbert (1859-1924) all have won world-wide fame. Our "March King," John Philip Sousa (1854-), is known in every land.

House of Dreams Untold

The "House of Dreams Untold"—the log cabin in the woods at Peterboro, New Hampshire, where MacDowell composed, and where most of his later music was written.

Among our adopted Americans are Charles Edward Loeffler (1861-), Walter Damrosch (1864-), Ernest Bloch (1880-) and Frederick Stock (1872-).



The greatest woman composer now living is Mrs. H. H. A. Beach (1862-), an American who is recognized all over the world.

Outstanding American composers of today are Ernest Schelling (1876-), John Alden Carpenter (1875-), Deems Taylor (1885-) and Leo Sowerby (1895-).

MODERN MUSICAL INSTRUMENTS

The Symphony Orchestra. The most important group of musical instruments is the symphony orchestra, which is divided into four groups, or choirs, of instruments related by their tonal character and style of construction.

The string choir consists of violins (divided into two parts), violas, violoncellos and double basses. The wood-wind choir is composed of flutes, piccolos, oboes, English horn, clarinets, bass clarinet, bassoons and contra bassoon. The brass choir includes the trumpets, French horns, trombones and tuba. The percussion choir, or "the battery," consists of the drums and bells; the tympani or kettledrums, side and bass drum, tom-tom and tambourine belong to the first section;

Chicago Symphony Orchestra

Founded in 1891 by Theodore Thomas, supported by a number of public-spirited Chicagoans. This orchestra, has had but two conductors—Theodore Thomas from 1891 to 1905, and Frederick Stock, since 1905. The orchestra owns its own home—Orchestra Hall, where this photograph is taken. Its popular concerts (established in 1914) reach a clientele scarcely touched by the symphony series. It is the third oldest orchestra in America.

the triangle, cymbals, bells, glockenspiel, celesta, xylophone, castanets and gongs belong to the latter section. The harp is not classified as a member of any definite choir.

The Stringed Instruments. The strings are the most important division of the orchestra. Their range is the most extensive. Not being dependent on the breath of the performers, they can hold a single note far longer than can the wind instruments, and also they can play from the softest pianissimo to the loudest fortissimo.

There are many important effects possible to the strings, but the most outstanding are the *tremolo* and *pizzicato*. Tremolo is produced by drawing the bow over the strings backward and forward with great rapidity. *Pizzicato* (an Italian word meaning "plucked") signifies that the strings are plucked by the fingers, the tone produced being similar to that of the guitar. The great compass of the violin may be increased by the use of harmonics. These are the overtones which are not consciously heard because the fundamental tone always overshadows them. When, however, a vibrating string is touched lightly with the finger, the vibrations of the fundamental tone are stopped and the harmonics or overtones are heard.

The violins are divided into two groups; the second violins play the second soprano or contralto voice to the first violin.

The viola is sometimes the contralto of the string choir, though its voice is usually the tenor of the quartette. It is a larger instrument than the violin and is tuned a fifth lower. Its tone is not as brilliant or penetrating as that of the violin, but possesses a lovely pathetic quality.

The violoncello is one of the favorite instruments. Its tone is more like that of the human voice than any other instrument. The cello is tuned in fifths, like the viola, but an octave lower in pitch. In the string quartette the cello serves as the bass; in the orchestra it is used as the baritone, and sometimes as the tenor.

The bass of the strings is the huge double bass, like the viola and cello a descendant of the viol family. Until Beethoven's time it was used chiefly to double the bass parts by the cello, but modern composers have used it as an important individual voice. Both the *tremolo* and *pizzicato* of the basses are frequently heard in dramatic music.

Although a primitive instrument, the harp is of recent introduction in the symphony orchestra. Developed through the centuries from the old harp of the Hebrews, Egyptians and Greeks, the harp has ever been a favorite folk instrument and was used by many peoples, although chiefly identified with the music of the Gaelic race.

The harp has forty-seven strings of varying lengths. These are plucked with the finger to produce the broad chords and *arpeggios* with which this instrument is chiefly identified. *Glissando*, the result of sliding the hands rapidly over the strings, and harmonics, produced by stopping a string and causing the overtones to be heard, are two effects used mostly by solo harp players.

The Wind Instruments. The wind instruments are of two classes, designated as wood winds and brasses. In all wind instruments the tone is produced by the vibration of a column of air in a hollow tube. This air column may vibrate as does a string, in parts as well as the whole. The larger the tube the lower is its tone. A tone is produced in the tube by covering or uncovering the holes at its side, as in the wood winds, or by directly contracting its length, as in trombones, or by means of crooks as in the other brass instruments. The bending of a tube makes no difference in its tone. If the French horn were straight it would be seventeen feet long.

The Wood Winds. The wood-wind family is of three types: the flute with an embouchure or hole on the side where the breath is regulated; the double reeds—oboe, English horn, bassoon, contra bassoon—played by the

Viol da Gamba
The ancestor of the present violoncello. From an old print.

vibration of double reeds set in the ends of the instruments (side of bassoon); the single reed clarinets and bass clarinets where the tone is produced by the vibration of a flat reed at the end of the instrument.

The flute, oboe and clarinet have nearly the same range, all being soprano instruments. The flute lacks much of the deep, sincère beauty of the oboe and the clarinet. It is extremely agile, well adapted to serve as a coloratura voice. It is useful in light, graceful passages, but is less brilliant and penetrating than its orchestral companions. The octave flute or piccolo has a voice very high and shrill; it is used chiefly in military music.

The oboe is the soprano of the double reed family and is essentially a pastoral instrument. Its voice is more reedy in quality than that of the clarinet, and, although it may play soft, tender passages, its tone is always penetrating. It is very difficult to play the oboe, for such a small amount of air sets its reeds in vibration that the player is constantly holding his breath. The oboe gives the tuning A to the orchestra.

The alto oboe is the English horn, an instrument longer and larger than the oboe, and bell shaped at the end. The tone of the English horn is always sad and plaintive, and it has been best used to sound a note of melancholy or sorrowful longing.

The bassoon is the bass of the double reed family. Although its voice is deep, the instrument possesses such agility of execution that its tones often sound grotesque; therefore it is frequently called "the clown of the orchestra." Yet it possesses a lovely pastoral singing voice in its upper registers.

The deepest wood wind is the double bassoon or contra bassoon, the double bass of the wood-wind family. The bassoons are called *fagottes* (from the Italian for "a bundle of sticks") because they are bent back and forth like sticks.

The clarinet is the soprano of the single reed family. It is a little larger than the oboe and has a very extensive range which gives its voice a fuller and deeper tone quality. The deep voice of the clarinet is found in the bass clarinet, an instrument similar in shape to the saxophone with a bell of brass turning upward like a pipe. Its voice is deep and impressive and similar to that of a pipe organ.

Although brass instruments, the French horns have a sympathetic tone quality which causes them to blend remarkably with the wood-wind instruments.

The Brass Choir. The instruments of the brass choir may be used as a quartette—trumpet, soprano; horn, alto; trombone, tenor, and tuba, bass. However, the usual method is to use the four horns in harmony, the three trumpets or three trombones with the tuba as a quartette. The lips of the players act as the reeds of the brass instruments, each tone being produced by a different lip pressure. It is very difficult to play these instruments.

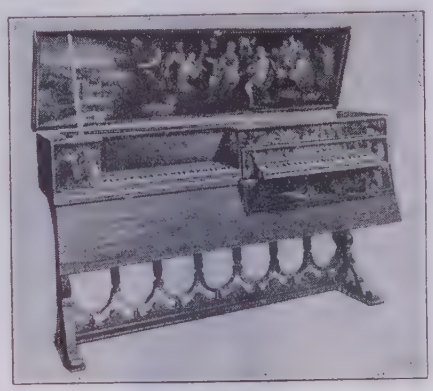
The trumpet is the highest voice of the brasses. Its noble, brilliant tone quality is one of the most penetrating in the orchestra. The French horn has perhaps one of the most exquisite voices of any orchestral instrument. Originally the hunting horn, its genial, happy voice was used first to depict hunting scenes. But its beautiful, romantic tone quality may express many varying moods. The trombone is different in construction from the other brasses; its tubes slide into each other, contracting its length and regulating its tone. The voice of the trombone is of great majesty and beauty, and when used with the full orchestra adds dignity and solemnity. The tuba is the bass of the brasses, giving impressive strength to the brass choir. Sometimes a tenor tuba is used by modern composers.

The Percussion Instruments. The percussion instruments accent the rhythmic rather than the melodic or harmonic character of music. The most important drums are the tympani or kettledrums, which are tuned to different pitches. They are copper kettles with vellum heads held in place by key screws which work on rings. There are three, often four, in a symphony orchestra. The drummer uses two sticks. He must have a perfect rhythmic sense, but also he must have absolute pitch, as frequently he must tune one or more drums to a new key while the orchestra is still playing in the old key. The side or snare drum is cylindrical. It has thin pieces of gut (snares) stretched under the vellum on one side which, as the player beats upon it, produces a sharp, incisive tremolo frequently needed in military music. The bass drum is the largest instrument in the group. In military music it is played *for-*

tissimo. The roll of the bass drum, played *pianissimo*, is very impressive in funeral marches.

The tambourine, sometimes classed with the drums because of its construction, is one of the oldest instruments in the world and has remained in use as an accompaniment for the dance for over two thousand years.

The orchestral bells are of various kinds and sizes. Some are cylindrical or tubular, consisting of eight tubes of different lengths hung from a wooden bar. The tom-tom or gong is a broad circular plate of metal that hangs from a bar and is struck with a drumstick. The effect is sinister and it is used to depict horror or the supernatural. Other bells are the glockenspiel or carillon, consisting of flat metal bars fastened to a wooden frame and struck by small drumsticks. The celesta, which has superseded the older glockenspiel, is a small keyboard instrument producing a sparkling bright tone as the player strikes the hammers with his fingers through a mechanism similar to that of the piano. The xylophone is an instrument made of different sized bars of wood struck by wooden hammers. In the cembalon flat wires are strung over two bridges and played with wire hammers. The triangle is a bent piece of steel shaped like a triangle. It is struck with a steel rod and gives out a clear, bell-like tone, often used to accent bright, joyous dance music. The cymbals are large cylindrical plates of metal that are either clashed together or struck with a drumstick. The castanets are similar in shape to the cymbals, but very small and made of wood. Dancers in Spain and Italy hold these clicking instruments in their hands to accent the rhythm of their dances.



The Brass Band. The brass band is composed of three choirs instead of the four found in symphony orchestras. Since the chief function of the band is to play in the open air, those instruments affected by climatic changes are usually eliminated and few stringed instruments are used, although occasionally double basses and harps are found in bands playing in halls.

The wood wind section comprises a predominance of flutes and single reed instruments, such as clarinets and saxophones. Few double reed instruments (oboes, English horns and bassoons) are used. The brass section is made up of French horns, trumpets or cornets, trombones and tubas. The percussion section corresponds to that found in the regular symphony orchestra.

The Pianoforte. The pianoforte (from the Italian, meaning "soft loud") is the most popular keyboard stringed instrument in general use. Our modern instrument was developed in the early eighteenth century by Cristofori, an instrument-maker of Florence, from the older keyboard forms of virginals, harpsichords and clavichords.

The chief difference between the modern piano and these earlier instruments is that in the pianoforte the tones are produced by vibrating strings struck by hammers, which are controlled by a keyboard. The mechanism is so constructed that the force of the blow struck by the hammers is under the control of the player's fingers, therefore the tone may be very soft or very loud; hence the name pianoforte. The early keyboard instruments were based on the principle of the strings being plucked by a quill, or plectrum, controlled by the keyboard; but there was no opportunity for dynamic difference in tone.

It is interesting to note that Bach wrote his works for the clavichord, which was still in use at the time of Beethoven. Mozart

Virginal

An old keyboard instrument of 1590, known also as the "double spinet," one of the predecessors of the modern piano.

used the harpsichord but preferred the new pianoforte. Since Beethoven every great composer has written for this, the most important of musical instruments.

The Organ. The largest and most intricate of musical instruments is the pipe organ, which has reached its present day perfection through centuries of development. One of the oldest of musical instruments, the organ was developed from the ancient Pan's pipes.

Courtesy Metropolitan Museum of Art

The First Piano

The first type of the modern piano, made by Cristofori of Florence in the early eighteenth century.

In medieval days, organs had about five hundred pipes, but the air pressure was supplied by blowers (or treaders), often as many as seventy men acting in this capacity. The keyboard was limited, and tone was produced by a blow from the clenched fist.

The tone of the modern organ is produced from a graduated series of pipes by means of compressed air, the player controlling the tone through a system of keyboards similar to the keyboard on a piano. The instrument is entirely in the control of a single player, the organist, who sits at the console. The wind pressure and pneumatic devices, which make the keyboard of the organ as easy to manipulate as that of the piano, are controlled by electricity.

The player produces the lower harmonic scale by using foot pedals. The "swell" enables him to increase or diminish the tone, while the "couplers" connect the several manuals, or keyboards, and add octaves above or below those which the player's fingers are producing. The "mixtures" bring into the maze of tone the artificial overtones. Thus there is today no effect in the orchestra not possible of imitation on the organ.

Folk Instruments. *The Accordion* is the most popular folk instrument in the world today. It is of recent origin, being the invention, in 1829, of a Viennese instrument maker, Damian. It consists of a pair of hand bellows to which is attached a keyboard having from five to fifty keys, according to the size of the instrument. As the player presses a key a valve opens and the air is admitted to the metal reeds, one sounding when the air is expanded and the other when it is compressed. The right hand plays the keys and the left hand works the bellows.

The Bagpipe is one of the oldest folk instruments and is still found in a primitive form among the shepherds of all the countries of Europe. The bagpipe is not an easy instrument to play. The bellows, held under the player's arm, force the air into the bag, while the pipes, fitted into the side, give out various tones as they are set in vibration by the player's breath. The "chanter pipe" has eight holes in the side, which are operated by the player's fingers. The bagpipe is the national instrument of the Scotch Highland regiments. During the seventeenth and eighteenth centuries the bagpipe, known as the *musette*, was the popular instrument of the ladies of the court.

The Balalaika is a Russian descendant of the medieval lute. It is a stringed instrument, played like the mandolin with a plectrum held in the player's right hand, while the strings are stopped with his left hand. The balalaika is triangular in shape, having a very long neck over which the two, often three, strings are stretched. The instrument is made in four sizes, forming a complete quartette. It is the most popular instrument of the Russian gypsies.

The Banjo is the typical folk instrument of the American Negroes. The natives of Senegambia possess an instrument called the "bania" which is similar to the banjo, having a long neck and a round head covered with skin or parchment. It is generally believed that the African Negroes modeled their instruments from the old Arabian *ooud*, which was the ancestor of the medieval lute of the Troubadours. Although the banjo came into America with the Negro slaves, it has reached a high state of development in this country.

The Cembalon, popular instrument of the Hungarian gypsies, is a descendant of the primitive dulcimer of Biblical days. It is a flat, wooden frame over which are stretched strings which are attached to tuning pins at either end. There are two, sometimes three, strings for each tone. Tone is produced by striking the strings with small, leather covered hammers. The compass of the cembalon is about three octaves.

The Concertina is an instrument similar in character to the accordion and was, incidentally, invented in the same year (1829) in England. The concertina has a keyboard at each end, the bellows being between. The same tone is produced when the bellows are compressed as when they are expanded. The compass of the concertina is much greater than that of the accordion, and as it is possible to play very intricate harmonies, the concertina is a very popular instrument in America today.

The Guitar, one of the survivors of the lute family, is found in its oldest form in Spain and southern Italy, where it was brought at the time of the Moorish invasions. The guitar has a flat back and curved sides and is now made in several sizes. The present day guitar has six strings, giving the instrument a range of about three and a half octaves. The tone is produced by plucking the strings with the fingers of the right hand, while the left hand stops the string on the frets of the neck.

The Mandolin resembles the old lute more closely than any of its family. It is a native of Italy. The mandolin in general use had four pairs of strings, tuned in fifths with the same tonality as the violin. These strings are of wire and vibrate as they are plucked by a quill or by a plectrum of shell. The player stops the strings with his left hand, the pitch being indicated by frets on the long-necked keyboard.

The Ukulele is the Hawaiian adaptation of the guitars and mandolins brought to the South Seas by the Portuguese and Spanish sailors. A miniature guitar in shape, the tiny metal strings of the ukulele are capable of many new and interesting chord combinations.

The Zither is native to the Bavarian Highlands and the Tyrolese Mountains. It is a descendant of a very old instrument—the *cithara* of ancient Greece. In China the *che*, and in Japan the *koto*, are instruments of the same type. The zither consists of a flat box, which lies on a table. Across this are stretched five metal strings which pass over frets. The melody is played by a plectrum attached to the player's right thumb; this plucks the string as the tones are stopped by the player's left hand. In addition to the five melody strings there are from twenty-five to forty open strings; these are played as an accompaniment to the melody, being struck harp-fashion by the fingers of the right hand.

GREAT NAMES IN MUSIC

FOURTH TO THIRTEENTH CENTURY

Italy
- St. Ambrose (340–397)
- St. Gregory (540–604)
- Guido of Arezzo (995–1050)

Switzerland
- Notker Balbulus (830–912)

Netherlands
- Hucbald of Flanders (840–930)

Germany
- Franco of Cologne (about 1200)

Early Secular School
- Troubadours (12th and 13th centuries)
- Richard I of England (1157–1199)
- Chatelain de Coucy (1157–1192)
- King Thibaut of Navarre (1201–1287)
- Adam de la Halle (1240–1287)

Minnesingers
- Wolfram von Eschenbach (1165–1220)
- Gottfried von Strassburg (—)
- Walter von der Vogelweide (1165–1230)
- Heinrich von Meissen (—1318)

Mastersingers
- Hans Sachs (1494–1576)

FOURTEENTH AND FIFTEENTH CENTURIES

Gallo-Belgic School
- William de Machaut (1300–1372)
- Guillaume Dufay (1400–1474)

England
- Walter Odington (—1330)
- John Dunstable (1370–1453)

Netherlands
- Johannes Okeghem (1430–1513)
- Jacob Hobrecht (1430–1506)
- Johannes Tinctor (1446–1511)

SIXTEENTH CENTURY

Italy
- Giozeffo Zarlino (1517–1590)
- Claudio Merulo (1533–1604)
- Andrea Gabrielli (1510–1586)
- Giovanni Gabrielli (1557–1612)
- Giovanni Pierluigi Palestrina (1526–1594)
- Filippo Neri (1515–1595)
- Emilio de Cavalieri (1550–1602)
- Giovanni Maria Nanini (1545–1607)

Germany
- Martin Luther (1483–1546)
- Sethus Calvisius (1556–1615)
- Hans Leo Hassler (1564–1612)

England
- Thomas Tallis (1516–1585)
- Thomas Morley (1557–1603)
- Thomas Weelkes (dates unknown)

Netherlands
- Josquin des Pres (1450–1521)
- Adrian Willaert (1480–1562)
- Cyprian de Rore (1516–1565)
- Jacob Arkadelt (1514–1560)
- Claude Goudimel (1502–1572)
- Orlando de Lassus (1520–1594)
- Philip de Monte (1521–1603)

SEVENTEENTH CENTURY

Italy
- Felice Anerio (1567–1620)
- Jacopo Peri (1561–1633)

DICTIONARY OF MUSICAL TERMS

A cappella (It.) (*ä käp-pĕl'lä*). In the old church style; vocal music unaccompanied, especially those pieces of the Italian school.

A capriccio (It.) (*ä kä-prēt'chō*). At will; according to the individual taste.

Accelerando or **Accelerato** (It.) (*ät-shĕl-ĕr-än'dō* or *ät-shĕl'ĕr-ät'ō*). Gradually increasing the speed.

Accent. A stress or emphasis upon a certain note or passage to mark its position in the bar, or its relative importance in regard to the composition. The first beat of each measure has *primary* accent. In $\frac{4}{4}$ time, the third beat has *secondary* accent; in $\frac{9}{8}$ time the fourth has secondary accent, the seventh *tertiary*. Notes specially accented are marked with the sign ∧, called *sforzando*, abbreviated *sf.*, *sfz.*, or *fz*.

Accessory Notes. Small embellishing notes which are located one degree above or one degree below the principal note.

Accidentals. Sharps, flats, double sharps, double flats and naturals which are not provided for in the signature.

Accompaniment. A separate part or parts, for voices or instruments, added to a solo or concerted piece, to enrich or support the general effect, or to produce such effects as would be otherwise unattainable.

Acoustics. The science which treats of the nature and laws of sound.

Action. The mechanism attached to the keys of piano or organ; also the mechanism attached to the pedals of a harp, which changes the pitch of the strings by shortening them.

Adagio (It.) (*ä-dä'jō*). Slowly; quicker than *largo* but slower than *andante;* also, a name given to a movement written in that time.

Ad libitum (Lat.) (*äd lĭb'ĭ-tŭm*). At will; in passages so marked, the time may be altered at the will of the performer; also, the part so marked may be omitted.

Agitato (It.) (*ä'jē-tä'tō*). An agitated or restless style of playing or singing, in which the time and expression are broken and hurried.

Air. In its modern sense, a tune, or the tune, or melody, with or without words; the part of the composition which carries the melody.

Alla breve (It.) (*äl'lä brā'vĕ*). A direction that the notes are to be made shorter, that is, the pace taken quicker than usual. Expressed in the signature by $\frac{2}{2}$.

Allegretto (It.) (*äl'lā-grät'tō*). (1) Rather light, cheerful and quick; slower than allegro. (2) A movement in this time.

Allegro (It.) (*äl-lā'grō*). Quick, lively. Sometimes used to describe a whole movement of a quartet, sonata or symphony.

Allegro con brio (It.) (*äl-lā'grō kōn brē'ō*). Quickly and with spirit.

Alto. One of the chief divisions of the human voice; female altos are more properly called contraltos. In mixed chorus, it is the next part below the soprano sung by the low female voice; a tenor violin, or viola; term formerly given to the highest male voice or part.

Amateur. One who pursues the practice of any art for pure love, in distinction to one who is engaged in its employment for pay.

Andante (It.) (*än-dän'tĕ*) (Literally, walking.) Moderately slow, but flowing easily; often qualified by other words, as *con moto, largo, maestoso.*

Andantino (It.) (*än'dän-tē'nō*). A diminutive of andante, by some understood to mean *not so slow* as andante; by others, rather *slower than* andante.

Anthem. A vocal composition, the words of which are usually selected from the Bible, used in church either with or without accompaniment.

Appassionato (It.) (*äp-päs'syō-nä'-tō*). With feeling, passion or affection.

Appoggiatura (It.) (*äp-pōd'jä-tōō'rä*). An accessory note, placed before a principal note. If it is marked with a diagonal line through the stem and hook, it is called *short* and is played with the least possible duration; if it is without a diagonal line, it is called *long* and has definite time value as indicated.

Arabesque, Arabesk. An embellished work.

Aria (It.) (*ä'rē-ä*). (1) An air. (2) A vocal solo with instrumental accompaniment, generally threefold in form. The words consist frequently of two sentences.

Arioso (It.) (*ä rē-ō'sō*). In the style of an air; the direction that the music to which it refers is to be performed tunefully, sweetly, in the style of an aria.

Arpeggio (It.) (*är-pĕd'jō*). Playing the notes of a chord in succession instead of striking them together; marked with a wavy line before the chord.

Articulation. (1) In singing, the art of distinct pronunciation. (2) In instrumental music, the art of producing proper tone by a right adjustment of the fingers, or the lips.

Augmentation. The introduction of a subject of a fugue or canon, in the course of its progress, in notes of longer duration.

Authentic Cadence. A final close, in which the common chord of the tonic is immediately preceded by the common chord of the dominant.

Auxiliary Notes. Notes not essential to the harmony, introduced for the sake of breaking monotony, or of giving freedom of motion to one or more of the parts. They may occur on either the accented or the unaccented part of the bar, and if introduced below the melody should be only a semitone from the proper note of that melody, but if above they may be either a tone or a semitone as the position in the scale would warrant, or taste suggest.

Ave Maria (Lat.) (*ä'-vä' mä-rē'ä*) (Hail! Mary). The angel's salutation of the Blessed Virgin Mary, used in the Roman Catholic Church as an Antiphon, etc.

Bagatelle (Fr.) (*bäg-ä-tĕl'*). Sketch, short piece, trifle.

Ballad. A short, simple song of natural construction, usually in the narrative or descriptive form.

Ballet (Fr.) (*bäl'lä*). A theatrical representation of some story by means of dances, or pantomimic action, accompanied by music.

Bar. A line drawn from the top to the bottom of the stave to denote the division of the time in a piece of music, and the place of the strong accent.

Barcarolle (Fr.) (*bär-kä-rōl'*). A song or air sung by the Venetian gondoliers, or boatmen, while at work.

Baritone. A male voice intermediate between bass and tenor; also applied to any musical instrument between bass and tenor.

Bass. The lowest part in a musical composition, the lowest male voice; the lowest of a family of instruments.

Baton (Fr.) (*bä tôn'*). Stick used by a leader in beating time.

Beat. A single motion of the hand, or baton, in beating time. A division of a bar, or measure.

Bell. The lower termination of any tubular musical instrument which by the outward turning of the rim assumes the form of a bell.

Berceuse (Fr.) (*bĕr sûz'*). A cradle song.

Binary Form. The form of a movement which is founded on two principal themes or subjects.

Bolero (Sp.) (*bō-lā'rō*). A Spanish dance in triple measure with strongly-marked accent, similar to the cachucha. It is accompanied by singing and castanets.

Bowing. The art of managing the bow; the proper manner of using the bow, indicated by certain marks; ⊓ for down bow; ∧ for up bow; two dots over a note for *spiccato* or *bounding bow.*

Break. (1) The point of junction in the quality of tenor, soprano and alto voices. A genuine bass voice has no break. (2) Break, in an organ stop is the sudden alteration of the proper scale-series of the pipes by returning to those of an octave lower in pitch.

Bridge. A piece of wood which, on instruments having a resonance-box, performs the double duty of raising the strings above the belly, and of terminating at one end their vibrating portion.

Brindisi (It.) (*brēn'dē-zē*). A drinking song.

Burden. The chorus or refrain of a song.

Cachucha (Sp.) (*kä-chōō'chä*). A Spanish dance, resembling the bolero.

Cadence. (1) A close in melody or harmony, dividing it into numbers or periods, or bringing it to a final termination. (2) The end of a phrase, formerly called fall, either in melody or harmony.

Cadenza (It.) (*kä-dent'sä*). A florid ornamental passage introduced before the cadence of a song or instrumental solo.

Canon. A contrapuntal composition in which the melody is taken by the leading voice, and then taken up in turn by the second, third and fourth voices at intervals of a definite number of beats or measures.

Cantabile (It.) (*kän-tä'bē-lĕ*). In a singing manner.

Cantata (It.) (*kän-tä'tä*). A short work in the musical form of an oratorio without action.

Canticle. A song or hymn in honor of God, or of some special sacred event.

Canto (It.) (*kän'tō*). The upper voice part in concerted music, so called because it has the melody or air.

Cantor (Lat.) (*kăn'tôr*). A singer; a precentor.

Cantus firmus (Lat.) (*kăn'tus fĕr'mŭs*). (1) The *tenor* or chief melody. (2) A fragment of plain-song, to which counterpoint has been added. (3) Any subject chosen for contrapuntal treatment, generally a short diatonic passage of semibreves or other long notes.

Canzona, Canzone (It.) (*kän tsō'nä*). A short song, the music being more important than the words.

Capellmeister (Ger.) (*kä-pĕl'mis'tĕr*), (1) The musical director of a church or chapel. (2) A conductor of a band or an opera.

Capriccio (It.) (*kä prēt'chō*). A freak; whim; fancy. A composition irregular in form.

Carillon (Fr.) (*kăr'ĭ-lôn* or *kăr ĭ-yon'*). A set of bells upon which a melody can be played; an instrumental piece in the style of carillon music.

Carol. A song of praise, applied to a species of songs sung at Christmastide; originally a song accompanied with dancing.

Castanet. A musical instrument of percussion introduced into Spain by the Moors. Originally they were of dried chestnut husks, but later were made of hard wood.

Catch. A round for three or four voices, in which each singer in turn "catches" up the melody; later usually with comic effect.

Cavatina (It.) (*ka-va-tē'na*). A melody or a more simple form than the *aria.*

Celeste (Fr.) (*sā-lĕst'*). A direction for the use of the soft pedal.

Chaconne (Fr.) (*shā-cŏn'*). A slow dance in $\frac{3}{4}$ time.

Chamber Music. Vocal or instrumental compositions suitable for performance in a small hall, as opposed to a concert-room; instrumental music in the sonata form, for a small group of string or woodwind instruments, with or without piano.

Chanson (Fr.) (*shăn'son'*). A song; a vocal solo with piano accompaniment; formerly a ballad.

Chant. (1) A simple melody, generally harmonized in four parts, to which lyrical portions of the Scriptures are set, part of the words being recited *ad libitum*, and part sung in strict time. (2) To recite musically.

Characters. A general name for the signs employed in music, such as brace, bind, bar, sharp, flat, natural, clef, stave, shake, turn, beat and the signs of words indicating time and expression.

Chime. A set of bells tuned to a musical scale; music played upon a set of bells; music or melody; to sound in harmony.

Choir. A group of singers, usually connected with a church; that part of a church edifice set apart for the singers.

Choir Organ. In a large pipe organ, that group of pipes and the corresponding manual having a soft tone and therefore suitable for the accompaniment of vocal music.

Choral. (1) Of, or belonging to the choir, concert or chorus. Choral service, a service with music. (2) A hymn or psalm tune.

Chorale (Ger.) (*kō-rāl'*). Psalm or hymn tune; a form of sacred song introduced by Luther.

Chord. A combination of musical sounds, consonant or dissonant.

Chorister. A member of a choir whether juvenile or adult.

Chorus. A group of singers; a choir; a composition intended for a chorus; a refrain.

Chromatic. Progression by semitones.

Chromatic Scale. Including every tone within the octave.

Chromatic Signs. Marks used in musical notation to indicate that a note should be played a semitone higher or lower than it is written. These marks are: the sharp (♯); the flat (♭); the natural (♮); the double sharp (𝄪); and the double flat (♭♭).

Clef. A character used to determine the name and pitch of the notes on the staff to which it is prefixed.

Close Harmony. Harmony produced by drawing the parts which form it closely together.

Coda (It.) (*kō'dä*). The tail of a note; the bars occasionally added to a contrapuntal movement after the close or finish of the *canto fermo;* that closing adjunct of any movement, or piece, specially intended to enforce a feeling of completeness and finality.

Coloratura (It.) (*kŏl-ō-rä-tûr'ä*). Ornamental passages, runs, trills, embellishments, in a vocal or instrumental solo; a high soprano voice of great flexibility and unusual brilliancy.

Common or **Double Time.** Time with two beats in a bar, or any multiple of two beats in a bar.

Compass. The whole range of sounds capable of being produced by a voice or instrument.

Composer. An author of music.

Composition. (1) A piece of music, for voices or instruments, or a combination of both effects, constructed according to the rules of art. (2) The act and the art of writing original music.

Concert. A public performance of music, in which a number of singers or instrumentalists, or both, take part.

Concerto (It.) (*kŏn-chĕr'to*). (1) A concert. (2) An extended composition in sonata form for a solo instrument with orchestral accompaniment.

Concertmeister (Ger.) (*kŏn-tsĕrt mīs'tĕr*). The leader of the band, the conductor; the leader of the first violins, who is next in rank to the conductor.

Conductor. The director or leader of an orchestra or chorus.

Con sordini (It.) (*kŏn sôr-dē'nē*). With the mutes on; with the soft pedal at the pianoforte held down.

Contra (It.) (*kŏn'trä*). Against. In compound words this signifies an octave below.

Contrabass (It.) (*kŏn'trä-bās'*). The double bass; the deepest toned stringed instrument played with a bow.

Contralto (It.) (*kŏn-träl'tō; kŏn-träl'tō*). The voice of deepest tone in females.

Cotillon (Fr.) (*kō-tĭl'yŭn* or *kō'tē-yon'*). A lively, spirited dance, introducing a great variety of figures, such as the pyramid, the two flowers, the coquette, a quadrille.

Counterpoint. The art of adding one or more parts to a given theme or subject.

Country-Dance. A rustic dance, of English origin in which performers were arranged face to face, and performed certain prescribed figures.

Courante (Fr.) (*koō-rănt'*). "Running." A dance of French origin in triple time; the second part in the old *suites des danses.*

Cremona. (1) A violin made in the town of Cremona. (2) A reed stop in the organ.

Crescendo (It.) (*krē-shĕn'dō*). Increasing, a gradual increase in the force of sound expressed by the sign . . <, or the abbreviation *cresc.*

Czardas (*chär'däsh*). The Hungarian national dance.

Da Capo (It.) (*dä kä'pō*). From the beginning.

D.C. Abbreviation for da capo.

Debut (Fr.) (*dā'bū'*). A first appearance.

Degree of a Scale. A stop in the tone-ladder; it may consist of a semitone, a tone, or—in the minor scale—an augmented tone.

Descant. The addition of a part or parts to a tenor or subject.

Development of a Subject. The elaboration of a given theme, according to the rules of art.

Diapason (Eng.) (*dī-ä-pā'zŏn*). (1) An octave. (2) The name given in this country to the most important foundation stops of an organ, termed in other countries more properly *Principal.*

Diatonic (Gr.) (*dī'ä-tŏn'ĭk*). Pertaining to the major and minor scales of eight tones to each octave, in any key.

Dilettante (It.) (*dē'lĕt-tän'tē*). An amateur.

Diminished Chord. A chord composed of a fundamental, a minor third, and a diminished fifth.

Diminuendo (It.) (*dē-mēn'ōō-ĕn'dō*). Decreasing in power of sound.

Dirge. A solemn piece of music, of a funeral or memorial character, so called from the first word of the Antiphon, "Dirige, Domine Deus meus, in conspectu tuo, viam meam."

Discord. A chord which, when struck or sung, requires to be resolved into a concord.

Dispersed Harmony. Harmony in which the notes composing the chord are at wide intervals from each other.

Dissonance. An interval or chord displeasing to the ear and requiring to be followed by another in which the dissonant note is resolved.

Divertimento (It.) (*dē-vĕr'tē-mān'tō*). (1) An instrumental composition in several movements (six or seven), like a *serenada* or *cassation.* (2) A potpourri.

Divisi (It.) (*dē-vē'zē*). A direction that instruments playing from one line of music are to separate and play in two parts. The reunion of the parts into unison is directed by the words "*a due.*"

Dominant. The fifth degree of the scale; the reciting note of Gregorian chants.

Double Bar. A sign formed of two single bars showing (1) the end of a piece; (2) the end of a movement of a work; (3) the end of a portion to be repeated; (4) the commencement of a change of key; (5) the commencement of a change of time; (6) the end of a line of words set to music as in a hymn tune.

Double Bass. The largest of the stringed instruments played with a bow.

Double Flat. A sign (♭♭) used before a note already flatted in the signature, which depresses the note before which it is placed another half tone. It is contradicted by a natural and a flat.

Double Octave. The interval of a 15th.

Double Sharp. A sign (𝄪) used before a note already sharp, to indicate that it is desired to raise the pitch by a semitone. It is contradicted by a natural and a sharp.

Down Beat. The first beat in each bar is so called because in counting time the hand or conducting stick is allowed to fall at that place.

Doxology (Gr.). The hymn or song of praise—the Gloria in Excelsis and the Gloria Patri as sung in the Christian church; also any metrical form of the same.

Drone. The largest pipe of the bagpipe, sounding only one note, which serves as a bass for every tune; the chorus or burden of a song.

Duet. A composition for two voices or instruments, or for two performers upon one instrument, or for two instruments of the same kind.

Dynamics. That part of musical science which deals with differences and contrasts in loudness of tones.

Echo. A sound produced by reverberation.

Eighth. The interval of an octave; *Eighth note*—a note whose value is $\frac{1}{8}$ that of a whole note.

Encore (Fr.) (*än' kôr'*). Again; more; a demand for the reappearance of a performer, as by applause; the performance given in response to such a demand.

Enharmonic. (1) One of the three genera of Greek music, the other two being the Diatonic and Chromatic. (2) Having intervals less than semitone. (3) An enharmonic modulation is a change as to notation, but not as to sound.

Ensemble (Fr.) (*än'sän'bl*). Together; the whole. (1) The general effect of a musical performance. (2) The union of the whole company of performers in a concerted piece.

Entr'acte (Fr.) (*än'träkt'*). Music played between the acts or divisions of an opera, drama or other stage performance.

Episode. A term in fugue writing, applied to those phrases which are supplemental to the main subjects or their answers.

Etude (Fr.) (*ā-tūd'*). A study, exercise or lesson.

Euphony. Sweet sound. An agreeable combination of sounds.

Exercise. (1) Preparatory practice in order to obtain skill. (2) A composition intended for the improvement of the singer or player. (3) A composition or thesis, required of candidates for degrees in music in the universities.

Expression. The power or act of rendering music so as to make it the vehicle of deep and pure emotion; the *spirit* of music as opposed to the mere mechanical production of sound. Expression marks are given in compositions to aid the performer in the proper interpretation of the number.

Extemporize. To play *extempore,* that is, to create melody and harmony without premeditation.

Extravaganza (*ĕks-trăv'ä-găn'zä*). A composition in burlesque style.

Facile (Fr.) (*fäs'ĭl*). Easy.

Falsetto (It.) (*fäl-sät'tō*). The artificial or supplementing tones of the voice, higher than the chest or natural voice.

Fandango (Sp.) (*făn-dăng'gō*). A lively Spanish dance in triple time, derived from the Moors. It is danced by two persons, male and female, and accompanied by the sounds of a guitar.

Fanfare (Fr.) (*făn'fâr'*). A flourish of trumpets, a call.

Fantasia (It.) (*făn'tä-zē'ä*). A composition in a style in which form is subservient to fancy.

Fermata (It.) (*fär-ma'tä*). A pause—from *fermare,* to stay or stop.

Fifth. A diatonic interval of five notes. The interval between a fundamental tone and the fifth tone above.

Figure. A form of melody or accompaniment maintained throughout the phrase in which it is suggested. In a melody, figure is called sequence. In harmony a figure relates to the rhythmical observance of a certain form in all the accompanying chords to the melody. (2) A musical phrase. (3) A florid melody.

Finale (It.) (*fē-nä'lĕ*). The conclusion; the last piece of any act of an opera; the concluding number of a concert; the last movement of a composition in the sonata form.

Fine (It.) (*fē'nā*). The end; used to show the end of a piece or movement; often a repeat, or partial repeat.

Fingering. The art of placing and using the fingers properly in performing upon a musical instrument.

Flat. The sign (♭), which directs the lowering of the tone to which it is prefixed by one semitone; singing or playing is said to be *flat* when the sounds produced fail to reach the true pitch.

Foot. (1) A metrical measure. (2) A drone bass. (3) The chorus of a song. (4) The part of an organ pipe below the mouth. (5) To foot, to dance.

Form. The pattern or design in which musical ideas are presented.

Forte (It.) (*fôr'tĕ*). Loud; powerful.

Fortissimo (It.) (*fôr-tēs'sē-mō*). Very loud.

Forzando (It.) (*fôr-tsän'dō*). Forced; emphasis upon one note or chord; marked >.

Fourth. An interval of four notes.

Free Style. Composition not absolutely according to the strict rules of counterpoint.

Fugue (*fūg*). A polyphonic composition constructed on one or more short subjects or themes, which are harmonized according to the laws of counterpoint, and introduced from time to time with various contrapuntal devices.

Full Score. A score in which all the parts for voices and instruments are displayed.

Fundamental. The lowest element of a tone, the other elements being its harmonics; applied also to the lowest note of a chord when the chord is founded upon that note.

Fundamental Tones. The tones from which harmonics are generated; that is the first, fifth and fourth tones of any diatonic scale.

Galop (Fr.) (*găl'ŭp*). A lively dance in $\frac{2}{4}$ time, originally a separate and independent dance, but now also forming a portion of a set of quadrilles.

Gavotte (*gä-vŏt'*). A dance tune of a lively yet dignified character, said to be of French origin, and to take its name from the Gavots; in quick common time, introduced at the French Court in the sixteenth century, the step characterized by raising of the feet instead of sliding; a composition in gavotte style.

Gigue. See Jig.

Glee. A vocal composition of three or four more or less independent parts, not necessarily gleeful; popular in England between 1760 and 1830.

Glissando (It.) (*glēs-sän'dō*). Slurred; in a gliding manner.

Grace Notes, Graces. Ornamental notes or short passages, introduced as embellishments into vocal or instrumental music, not actually essential to its harmony or melody. Grace notes are written small and are not counted as part of the measure.

Gregorian Chant. A style of church music without definite rhythm, written in one of the eight church modes or scales, formerly attributed to Pope Gregory. It is now believed that he did not originate it, but merely arranged and edited such music as existed.

Half-note. A note having half the time value of a whole note and twice that of a quarter note.

Half-rest. A pause equal in duration to a half note.

Harmonic Modulation. The change from one key to another in a succession of chords.

Harmonics. Higher partial tones present in practically every musical sound, which can also be sounded separately upon many musical instruments.

Harmony. A combination of tones which, sounded simultaneously, produce a pleasing effect; the structure of music with respect to the composition and progression of its chords, as contrasted with melody and rhythm; music consisting of a progression of chords, as distinguished from counterpoint, which consists of melody added to melody.

Harp. A stringed instrument of triangular form, furnished with gut strings. It has a compass varying from three to six octaves and a half, according to the size of the instrument.

Head-voice. The sounds produced above the chest-register, but not in falsetto.

Hold. An old English name for the sign of a pause (𝄐).

Homophony (Gr.) Unison of voices or instruments of the same character.

Hymn. A lyric for use in worship.

Imitation. The repetition of a short subject by another part.

Impresario (It.) (*ĕm prĕ-sä'rē-ō*). A designer, conductor or manager of a concert or opera party. This term is often applied to a man who trains singers, or obtains them for public performances.

Impromptu (Fr.) (*ĭm-prŏm'tŭ*). A piece of music written or played without previous preparation of the subject.

Improvisation. The act and the art of composing and rendering music without previous preparation.

Inflection. Any change in the pitch of the voice.

Interlude. A piece of music either impromptu or prepared, played between the acts of a drama, the verses of a canticle or hymn or between certain portions of a church service.

Intermezzo (It.) (*ēn'tĕr-mĕd'zō*). An interlude; a short movement in the symphony; one of the parts of the old suite.

Interval. The distance between any two sounds; *harmonic*, if between two tones sounded together and *melodic*, if between two tones sounded in succession. The intervals of the diatonic scale are do, *unison* or *primo*; do-re, *second*; do-mi, *third*; do-fa, *fourth*; do-sol, *fifth*; do-la, *sixth*; do-si, *seventh*; do-do, *eighth* or *octave*. Of these, the *unison*, *fourth*, *fifth* and *octave* are classified as *perfect*. The *second*, *third*, *sixth* and *seventh* are *major* in the major scale. The *minor intervals* are a chromatic half step smaller than the major intervals of the same name. *Augmented intervals* are a chromatic half step larger than perfect and major intervals. *Diminished intervals* are a chromatic half step smaller than perfect and minor intervals. Intervals not exceeding an octave are called *simple;* those greater than an octave, *compound*.

Intonation. The method of producing sound from a voice or an instrument; correctness of pitch; the method of chanting certain portions of the church services.

Introduction. An opening strain or short movement which prepares the way for the main body of a composition.

Inversion. Changing the position of notes forming intervals, chords or themes.

Jig or **Gigue** (Fr.). A lively dance which may be performed by one or more dancers.

Key. (1) In its modern sense, it is the starting point of the definite series of sounds which form the recognized scale. Different starting points require the relative proportion of the steps of the scale to be maintained by means of sharps or flats in the signature. The key of C requires no flats or sharps for this purpose, hence it is called the *Normal* key. (2) Mechanical contrivance for closing or opening ventages, as in flutes, clarinets, etc.

Keyboard. The range of keys upon a pianoforte or organ. Keys played by the fingers are called *manuals;* those by the feet are called *pedals*.

Key-note. The note which, according to the signature, forms the starting point of the scale. The tonic, or first note of the scale, as "do."

Keys, Related. Those differing by not more than one accidental in their respective signatures.

Larghetto (It.) (*lär gät'tō*). (dim. of *largo*.) At a slow pace but not as slow as *largo*.

Largo (It.) (*lär'gō*). Slow; broadly.

Larynx. The organ by means of which we produce vocal sounds. It is situated at the top of the trachea or windpipe, of which it forms a continuation, and its position is known popularly by that of the "Adam's apple," the prominence of one of the cartilages or masses of gristle which form it.

Leading Note. The seventh degree of the ascending major scale. It is called *leading* because of its tendency to rise or lead up to the tonic.

Ledger Lines. Short lines drawn above or below the ordinary stave at the relative distances at which the whole lines would be placed.

Legato (It.) (*lĕ-gä'tō*). Smooth and connected, opposite of *staccato*.

Leitmotif (Ger.) (*līt'mō-tēf'*). A guiding theme associated with a special person, act or sentiment in an extended composition.

Libretto (It.) (*lē-brät'tō*). Literally, little book; the text of an opera or oratorio.

Lied (Ger.) (*lēt*). A song, but the word is especially applied to that class of song which owes its origin and evolution to the German temperament, poetic leanings and national tastes.

Ligature. A slur; a group of notes sung to one syllable or in one breath, or bowed with one stroke.

Litany. A prayer, or supplication; in particular, that early form of prayer in which a minister recites a petition and the people answer "Lord, have mercy."

Lullaby. A cradle song.

Lyre. One of the most ancient stringed instruments.

Madrigal. An unaccompanied song, usually a love song, for three or more voices, often six or eight, making use of counterpoint and imitation; perfect about 1450 in the Netherlands.

Major. Greater. A major third consists of four semitones, a minor third of three; used to signify standard or normal as opposed to minor, diminished and augmented; applied to intervals, chords and keys.

Major Mode or **Scale.** The ordinary diatonic scale, having semitones between the third and fourth, and seventh and eighth degrees.

Manual. A key or digital of a keyboard; the keyboard of an organ played by the hands, as opposed to the pedal board played by the feet.

Marcato (It.) (*Mär-kä'tō*). Marked, or emphasized.

March. A musical composition so arranged as to be suitable for accompanying troops in marching. There are quick and slow marches, in double and triple time, besides marches peculiar to certain nationalities.

Mass. Name given to the Communion Office, Eucharist Service or Liturgy, from the words "Ite missa est" (Depart; the congregation is dismissed), sung by the priest or minister, just before the end of the service. The subdivisions are: Kyrie, Gloria, Credo, Sanctus, Benedictus and Agnus Dei.

Mazurka (Pol.) (*mä-zoor'kä*). A Polish dance of lively, grotesque character, the music of which is in $\frac{3}{4}$ or $\frac{3}{8}$ time, with a peculiar rhythm; a composition in the rhythm of this dance.

Measure. Time; pace; rhythm; the contents of a bar; also the space lying between two adjoining bars. In England the name used for a very stately dance, slow in movement, supposed to be somewhat like the Minuet and in favor on occasions of high Court functions, somewhat like our Grand March.

Mediant. The third degree of any scale.

Meistersinger (Ger.) (*mīs'tĕr-sing-ĕr*). A title given to the most renowned musician of a township or district in Germany during the Middle Ages.

Medley. A mixture; a composition made up of detached passages from other compositions; usually applied to vocal music.

Melodrama. A dramatic piece in which the interest is heightened by the character of the vocal or instrumental music accompanying certain situations.

Melody. An agreeable succession of simple sounds, produced by a single voice or instrument, and so regulated as to give a pleasing effect, or to be expressive of some kind of sentiment; opposed to harmony, which consists of two or more tones sounded simultaneously; the leading part of a composition.

Meter, Metre. The grouping of notes or beats into units of measure to form rhythm; the distribution of long and short, accented and unaccented notes in the measure.

Metronome (Gr.) (*mĕt'rô-nōm*). An instrument said to have been invented in 1816 by Maelzel, for the purpose of measuring the relative duration of the notes in a piece of music. The machinery is of clock work, and the various grades of time are measured on a balance-rod serving the purpose of a pendulum, the speed being regulated by a shifting or sliding weight. To be correct, the metronome should beat seconds when set at 60.

Mezzo (It.) (*mĕd'zō*). Medium, half, as *mezzo bravura* —semi bravura style.

Mezzo-Soprano (It.) (*mĕd'zō-sō-prä'nō*). A female voice, the range of which lies between the soprano and the alto.

Middle C. The note standing on the first ledger line above the bass stave and the first ledger line before the treble stave.

Minor (Lat.) Less; smaller; applied to intervals and to chords, scales, and keys having intervals a semitone less than major.

Minor Scale. A scale having its third and sixth minor. There are three forms: *Normal* or *natural minor* which has half steps between 2 and 3, and 5 and 6. *Harmonic minor* which is the same except that the 7th tone is raised a semitone. This makes it a scale with half steps between 2 and 3, 5 and 6, 7 and 8, and one step and a half between 6 and 7. The *Melodic minor* has half steps between 2 and 3, and 7 and 8 ascending, while in descending it usually has the form of the normal minor.

Minuet. A slow, graceful dance in triple rhythm, said to have been invented in Poitou about the middle of the seventeenth century; a composition in the rhythm of this dance.

Missa (Lat.) (*mē'zä*). A mass; as *missa pro defunctis*, a requiem mass.

Mode. A scale; a species of scale, as *major mode*, *minor mode;* a church scale.

Modulation. Going from one key to another, by a certain succession of chords, either in a natural and flowing manner, or sometimes in a sudden and unexpected manner; inflecting the voice musically.

Moll (Ger.) (*mōl*). Minor.

Molto (It.) (*mōl'tō*). Much; very; as *molto adagio*, very slow.

Monody (Eng.) (*mŏn'-ô-dĭ*). A song for a single voice, generally of a plaintive character. The term was originally applied to vocal solos in the church service.

Monotone. To recite words on a single note without inflections.

Motet. A vocal composition in harmony, set to words generally from the Scriptures, or to paraphrases of the sacred writing.

Motion. Melodic progression. (1) Motion of a single part, *conjunct* if by single degrees, *disjunct* if by skips. (2) Of two parts, *contrary* or *opposite* if one ascends while the other descends; *oblique* if one remains stationary while the other ascends or descends; *parallel* if both ascend or descend together. (3) Of several parts, *mixed* if two of these motions occur at the same time.

Moto (It.) (*mō'tō*). Motion; movement, as *con moto* with spirited movement, keeping up the interest of the music.

Motive. A musical figure or phrase which serves as the germ from which a composition or a movement is developed.

Movement. Same as *Motion:* style of rhythm, as waltz movement; a distinct division of a composition having its own key, rhythm, themes and general character.

Mute. A small instrument of brass, wood or ivory, so made that it can be readily fixed upon the bridge of a violin or violoncello, to muffle or deaden the sound. The direction for its use is written *con sordini*, or *muta*, its discontinuance by *senza sordini*.

Natural. A sign (♮) which restores a note to its position in the natural scale. It has the effect of sharpening a note previously flatted, or of flatting a note previously sharpened.

Natural Keys. Those having no sharps or flats in the signature, as C major and A minor.

Neapolitan Sixth. A name, apparently without much reason, given to a chord occurring on the subdominant of a minor key, and consisting of a minor third and minor sixth.

Nocturne. Originally a kind of serenade, or night piece; now a piece of music of gentle and quiet character.

Notation. The act and the art of representing music by means of notes and other symbols; these notes and other symbols taken collectively.

Nuances. Shades of musical expression.

Obbligato (It.) (*ŏb'blē-gä'tō*). An instrumental part or accompaniment of such importance that it cannot be dispensed with.

Octave. The interval of an eighth—major, minor or augmented; the whole series of tones within the interval.

Offertory (*ŏf'ĕr-tô-rĭ*). In the Roman Catholic Church an anthem or instrumental piece performed while the bread and wine are 'presented" to God before consecration, and during which a collection may be taken; in Protestant churches, music performed while an offering is being taken.

Open Score. When each part has a separate line assigned to it, music is said to be in *open score*. When more than one part is written, in *close* or *short score*.

Opera. A drama set to music, for voices and instruments, and with scenery, decorations and action.

Operetta. A little opera, generally of a light and playful character.

Opus (Lat.) (*ō'pŭs*). A work; a composition, as Opus No. 1, the first work of a composer. Properly the number of an opus refers to the order of publication, not of the composition. May include several numbers or may consist of a single piece.

Oratorio (*ŏr'ä-tō'rĭ-ō*). A sacred work analogous to an opera, but without action, scenery or costume.

Orchestra (*ôr'kĕs-trä*). (1) A band of musicians performing upon various instruments. The modern orchestra employs four kinds of instruments: (a) *stringed*—belonging to the violin family; (d) *woodwind*—flutes, oboes, clarinets and bassons; (c) *brass* —trumpets, horns, and trombones; (d) *percussive*— kettledrums, cymbals, triangle and bells. (2) The space in a theater occupied by the band or orchestra.

Organ Point (Pedal Point). A tone sustained by one part through a succession of harmonies of which it forms no part.

Ornamental Notes. Unessential notes introduced for the purpose of embellishment, such as *acciaccatura, appoggiatura, grace notes, trill, turn*.

Overture (Eng.) (*ō'vĕr-tûr*). An introduction to an oratorio, opera or other large composition.

Parallel Motion. The motion of two or more parts at fixed intervals as thirds, sixths. Parallel fifths are under certain limitations forbidden.

Paraphrase. The rearrangement of a composition for some other instrument than that for which it was originally written.

Part. The music for any one voice or instrument; division of a work.

Partita (It.) (*pär-tē'tä*). A composition consisting of a collection of dance tunes, which came into vogue about 1700; also called *suite*.

Part Song. An unaccompanied song for three or four voices, which originated in Germany.

Passage. A phrase of music; a figure; a run.

Passion Music. Music set to the narrative of our Lord's Passion in the Gospels, similar to a cantata or an oratorio.

Pastoral. A simple melody in $\frac{6}{8}$ time in a rustic style; a cantata, the words of which are founded on pastoral incidents; a complete symphony, wherein a series of pastoral scenes is depicted by sound-painting, without the aid of words.

Patetico (It.) (*pä-tĕt'ĭ-kō*). In a pathetic manner.

Pause. A rest or pause; a bar's rest.

Pedal. A foot lever, as piano pedal, organ pedal, harp pedal.

Pedal Keys. A set of pipe organ keys played by the feet.

Pedal Point. See Organ Point.

Pentatonic Scale. A name given by Carl Engel to the ancient musical scale which is easiest described as that formed by the black keys of the pianoforte. It consists of the 1st, 2nd, 3rd, 5th and 6th degrees of a modern diatonic scale.

Percussion. An ingenious contrivance whereby a hammer strikes the tongue of a reed and sets it in motion simultaneously with the admission of air from the windchest, thus securing the rapid speech of the reed; the instruments sounded by striking, as drums, cymbals, triangles, tambourines, bells, chimes, castanets and the xylophone.

Period. A complete musical sentence; it is composed of two or more phrases usually of four measures each, and closes with a cadence.

Phrase. A musical clause, corresponding to a line of a poem.

Phrasing. A musical punctuation; in piano music, it refers to varieties of touch; in violin music, to bowing; in singing, to breathing places.

Phrygian (Gr.) (*frĭ'jăn*). One of the Greek modes; the name of a cadence.

Piano (It.) (*pĭ-ăn'ō*). Softly; *pianissimo*, as softly as possible.

Pitch. The position of a sound with reference to the number of vibrations which cause it; as standard of pitch as *International pitch*, now used in all civilized countries except England, in which the A above middle C has 435 vibrations a second.

Pizzicato (It.) (*pēt'sē-kä'tō*). A direction to violinists to produce the tone by plucking the string with the finger instead of using the bow.

Plagal. Church modes beginning a fourth below the authentic and distinguished by the word hypo; also the name of a cadence formed when a subdominant chord immediately precedes the final tonic chord.

Plain Song. A non-metrical chant in one of the ecclesiastical modes, common in early church music; such a melody serving as *cantus firmus* in a contrapuntal composition; any simple tune or melody.

Polacca (It.) (*pō lăk'kä*). Polish. A title applied to melodies written in imitation of Polish dance tunes. Synonymous with the French word polonaise.

Polonaise (Fr.). See Polacca.

Polyphony. Music in which the parts or voices are melodically independent while at the same time in harmony; contrapuntal music; opposed to *homophony*, in which one part carries the melody.

Position. A chord is said to be in its *original position* when the ground note is in the bass, in other *positions* when the relative arrangement of the component notes is changed; a *position*.

Postlude. A concluding voluntary; a piece played at the end of the service.

Potpourri (Fr.) (*pō'pōō'rē'*). A medley, a collection of various tunes linked together.

Precentor. The leader of a church choir or of congregational singing.

Prelude. A movement played before, or an introduction to, a musical work or performance.

Presto (It.) (*prĕs'tō*). Quick; rapid.

Program Music. Music intended to portray or suggest a definite series of objects or events; first applied to Beethoven's "Pastoral Symphony."

Progression. *Melodic progression* is a succession of sounds forming a tune or melody; *Harmonic progression* is the movement of one chord to another, and is diatonic or chromatic.

Psalm. A sacred song.

Quadrille (Fr.) (*kwä-drĭl'*; *kä-drēl'*). A French square dance of five figures in $\frac{2}{4}$ or $\frac{4}{4}$ time; the music for such a dance.

Quartet. A composition in four parts, or for four performers; part of a movement sung by four voices *soli* as opposed to *coro*; the four performers rendering the quartet.

Quintet. A composition in five parts, or for five performers.

Recitative (It.) (*rĕs'ĭ-tä-tēv'*). Musical declamation.

Recitative Accompaniment. Recitative with accompaniment.

Refrain. The *burden* or *chorus* of a song, repeated at the end of each stanza.

Register. An organ stop; the range of voice or musical instrument.

Relative Key. A key whose tonic chord is a relative chord; that is, a key whose first, third and fifth degrees form a common chord made up of notes of the key to which it is related.

Repeat. A sign that a movement or part of a movement is to be twice performed. That which is to be repeated is generally included within the sign of two or four dots in the spaces of the staff.

Requiem (Lat.) (*rē'kwĭ-ĕm* or *rĕk'wĭ-ĕm*). A mass for the dead; a musical setting for the same.

Rests. Signs enjoining the silence of a performer for a given length of time.

Rhapsody (*răp'sō-dĭ*). A composition of irregular form, and in the style of an improvisation.

Rhythm (*rĭth'm*). Movement characterized by regular, measured or harmonious recurrences of stress or impulse, beat, sound accent or motion.

Ritardando (It.) (*rē'tär-dän'dō*). With gradually increasing slowness of pace.

Romance. A vocal or instrumental composition of a romantic character, without a fixed form.

Rondo (It.) (*rŏn'dō*). A vocal or instrumental composition in which the first strain recurs after each of the other strains.

Root. Called also fundamental note, generator and ground note. The lowest note if the chord is in its natural position, but some other if the chord is inverted.

Round. A composition in which several voices starting at stated distances of time from each other, sing each the same music, the combination of all the parts producing correct harmony.

Rubato (It.) (*rōō-bä'tō*). Literally, robbed; some notes are held for more, and others for less than their strict duration.

Run. A rapid succession of notes.

Saraband (Eng.) (*săr'a-bănd*). Spanish dance of Moorish origin, for a single performer, who accompanies himself with the castanets, in triple rhythm.

Scale. A "ladder"; a series of tones ascending by regular intervals, and descending, usually in the same order. The interval scheme of the modern scale is the octave. The standard and most common form is called *major*. The three *minor* scales are the *normal*, *harmonic* and *melodic*. Another variant form is the *chromatic*.

Scena (It.) (*shä'nä*). The largest vocal solo form, usually part of an opera, but sometimes an independent composition.

Scherzo (It.) (*skĕr-tsō*). Literally, jest; instrumental composition of a humorous, playful or whimsical character.

Schottische (Ger.) (*shŏt'tĭsh*). Literally, Scotch; a slow dance of modern introduction, written in $\frac{2}{4}$ time; the music for such a dance.

Score. A copy of a musical work in which all the component parts are shown, either fully, or in a compressed form.

Second. The interval between a fundamental tone and the next diatonic tone above.

Secondo (It.) (*sā-kŏn'dō*). Second; as *violino secondo*—second violin.

Semitone. A half a tone, or an approximate half a tone.

Sequence (Eng.) (*sē'kwĕns*). The recurrence of a harmonic progression or melodic figure at a different pitch or in a different key to that in which it was first given.

Serenade (Fr.) (*sĕr'ĕ-nād'*; *sā'rā-nād'*). Originally a vocal or instrumental composition for use in the open air at night, generally of a quiet, soothing character; now any composition of that general character.

Seventh. The seventh diatonic tone above a fundamental; the interval between a keynote and the seventh step.

Sextet. A composition for six voices or instruments; the performers of such a composition.

Sforzando (It.) (*sfôr-tsän'dō*). Emphasis upon a certain note or chord, marked *sf.* or (∧) or (>).

Shake. An ornament produced by the rapid alternations of two notes, either one tone or a semitone apart, as the case may be. The sign of the shake is *tr.*, the first two letters of the word trillo placed over the chief note.

Sharp. The sign (♯) which raises a note one semitone above the normal or natural pitch; above the proper pitch, as one sings or plays sharp.

Signature. The signs placed at the commencement of a piece of music. There are two kinds of signature, the time-signature and the key-signature—the latter requiring a clef to show the pitch.

Sixth, Cord of the. The first inversion of the common chord; it consists of a note with its third and sixth.

Slur. A curved line placed over notes directing that they are to be played or sung legato.

Solfeggio (It.) (*sōl-fäd'jō*). A singing exercise in which a single vowel or the syllables do, re, mi, fa, sol, la, si are used.

Solo. Alone; as *voci soli*—voices alone.

Sonata (It.) (*sō-nä'tä*). An instrumental composition made up of three or four movements in different though related keys and in different forms and moods.

Sonatina (It.) (*sō'nä-tē'nä*). A short sonata. One in which the subjects are not developed at length.

Song. A short poem intended for music; a musical setting of a short poem or portion of prose.

Soprano (It.) (*sō-prä'nō*). The highest kind of female or boy's voice. Also the singer possessing that voice.

Sotto Voce (It.) (*sŏt'tō vōt'shĕ*). In an undertone.

Space. The degree or interval between two lines of the staff.

Stabat Mater (Lat.). A well-known Latin hymn on the Crucifixion, sung during Passion week in the Roman Catholic Church.

Staccato (It.) (*stäk-kä'tō*). Detached; taken off; separated. Sometimes a dot over a note is called a staccato mark, but it is more properly the sign of a spiccato.

Staff. The five horizontal lines, on and between which music is written.

Stop. The pressure by the fingers of the strings upon the finger board of a stringed instrument; a fret upon a guitar or similar instrument; a collection, register or row of pipes in an organ.

Strain. A musical subject forming part of, and having relation to, a general whole; a complete period, its close being indicated upon the staff by a double bar.

String Quartet. Music written for four stringed instruments, usually two violins, a viola and a cello; the performers of such music.

Style. Character; form or temperament of music with reference to the result of individual influence; the conformity of music to the purpose for which it was written; the conventional or national method of performance, or its construction.

Subdominant. The dominant below; the fourth tone of the diatonic scale, which is in the same relation to the keynote from below as the dominant is from above.

Subject. The theme or principal phrase of any movement from which all the subordinate ideas spring or are developed.

Submediant. The sixth of the scale.

Subtonic. The seventh tone of the diatonic scale.

Suite (Fr.) (*swēt*). A set; series, or succession of movements in music; a large orchestral composition consisting of a series of movements in any one of a number of forms and in different keys; sometimes a collection of distinct compositions.

Supertonic. The tone one degree above the tonic in the diatonic scale.

Suspension. The holding or prolongation of a note in any chord which follows, thereby often producing a discord or dissonance which is resolved by moving the discordant tone into the chord tone which it had displaced.

Symphony. A composition for an orchestra, similar in construction to the sonata, which is usually for a single instrument.

Syncopation. Suspension or alteration of rhythm by driving the accent to that part of a bar not usually accented.

Tablature (Eng.) (*tăb'lä-tûr*). Now obsolete systems of notation, differing for each instrument, indicating the string, finger hole or key to be used instead of the note to be played.

Tarantella (It.) (*tä'rän-tĕl'lä*). A rapid Neapolitan dance in triplets, so called because it was popularly thought to be a remedy against the supposed poisonous bite of the tarantula spider. Others say that the bite of the spider causes this delirious dance, which ends fatally.

Technic (*tĕk'nĭk*). Manner of execution; musical skill.

Tema (*tĕ'mä*). Theme; subject.

Tempo (It.) (*tĕm'pō*). Time or measure; the rate of speed at which a composition should be played. Indicated at the beginning by such terms as *tempo rubato*—robbed or stolen time; *tempo di marcia*—in marching time.

Tenor. The third of the four kinds of voices arranged with regard to their compass; a musical instrument, the range of which corresponds to the high male voice.

Tetrachord (Gr.). A scale-series of four notes; half an octave.

Theme. One of the divisions of a subject in the development of sonata-form; the *cantus firmus* on which counterpoint is built; the subject of a fugue; a simple tune on which variations are made.

Thesis. The downward wave of the hand to denote the absence of accent.

Tie. A curved line placed over two or more notes in the same position on the stave, indicating they should be played as one.

Timbre (Fr.) (*tăm'bĕr* or *tăn'br'*). Literally, texture; the quality of tone or sound.

Time. The rate of speed at which a piece of music should be played.

Toccata (It.) (*tŏk-kä'tä*). A prelude or overture; a composition for the organ or harpsichord, popular in the sixteenth century, free in style, resembling the cappriccio.

Tone. Sound; quality of tone; a sound whose vibrations are sufficiently regular to give it a definite pitch.

Tonic Sol-fa. A letter-system of notation, and of teaching vocal music, employing the syllables do, re, mi, fa, sol, la, and si, with modifications for sharps and flats.

Touch. The resistance made to the fingers by the keys of a pianoforte or organ; the peculiar manner in which a player presses the keyboard, whether light, heavy, firm, etc.

Transition. A modulation; a passing; a change from one theme to another.

Transposition. A change of key; an inversion of parts in counterpoint.

Treble. The highest vocal or instrumental part, sung by women or boys, or played by violins, flutes, oboes, clarinets or other instruments of acute tone.

Treble Clef. The G clef on the second line of the stave used for treble voices and instruments of high and medium pitch, such as flutes, oboes, etc.

Tremolo (It.) (*trĕm'-ō-lō*). The rapid repetition of a note or chord which produces the effect of trembling or quivering; the stop of a pipe organ, which, when brought into use, causes the tones to tremble or flutter.

Triad. A chord of three notes; a common chord composed of a fundamental tone and the third and fifth above.

Trill. See Shake.

Trio. A composition for three voices or instruments; a part of a minuet, march, etc.

Triplet. A group of three notes performed in the time of two. The triplet is always indicated by a slur and the figure 3. ($\overset{3}{\frown}$).

Tuning Fork. An instrument of steel with two prongs, which, when set in vibration, gives out a musical sound varying in pitch according to the thickness of the metal or the length or width apart of the prongs; useful as a standard of pitch in tuning musical instruments.

Tuning. The adjustment of the sounds naturally produced by any instrument to some standard pitch and to their proper relation to each other.

Turn. An embellishment following a note, which consists of rapid alternation between the principal note, the note a step above, and the note a half step below, indicated by the sign (∾).

Tutti (It.) (*tōō'tē*). All; the whole, as *tutta forza*—the full power or force.

Unison. Having the same number of vibrations; identical in pitch; another name for the interval *prime*.

Variations. Certain modifications with regard to the time, tune and harmony of a theme proposed originally in a simple form.

Verse. Those portions of an anthem or service intended to be sung by a single voice to a part; a separate stanza of a song or a ballad.

Vibrato (It.) (*vē-brä'tō*). A tremulous quality of tone as opposed to a pure equal production.

Viol. A stringed instrument, shaped like the violin but of larger size.

Virtuoso (It.) (*vēr'tōō-ō'sō*). A skilled performer on some particular instrument, especially the violin.

Vivace (It.) (*vē-vä'tshĕ*). Quickly; sprightly.

Vocal. For or by the voice; music intended to be sung.

Voice. Sound produced by the vocal organs in singing or speaking; the faculty of uttering sound.

Voicing. The regulation of the tone and power of an organ pipe.

Volume. A term applied to the power and quality of the tone of a voice or instrument, or of a combination of sounds.

Voluntary. An organ prelude; an organ solo played before, during or after an office of the Church.

Waltz. A round dance in triple rhythm, performed by couples whirling around and advancing around the room; music in the rhythm of this dance.

Whole Note. The longest note in common use. Shorter notes are timed as parts of the whole note.

Whole Rest. A rest equal in duration to a whole note.

Whole Step. A major second; the interval between a fundamental tone and the next diatonic tone above.

CERAMICS

IN THE broadest sense the term ceramics includes the whole field of the compounds and mixtures of which the foundation is silica and to which solidity and permanence are given by the action of fire. In this term, therefore, are included not only pottery and porcelain but bricks, tiles, terra cotta, stoneware, glass, the hydraulic cements and enamels for steel ware and for use in jewelry. The practical production in each case involves mixing or preparation, shaping or application and firing or fusion.

The study of ceramics may be approached from many sides. The historical view concerns itself with the gradual development of the nations as expressed in fictile ware; the artistic is founded upon the historical and deals with clay, glaze and color as means of art expression; the technical and scientific considers the methods by which results are produced and the industrial or utilitarian view deals with the production of wares upon a large scale and as a commercial proposition.

Materials. Certain rocks and minerals are the foundation of all ceramic work. Clays of all kinds, feldspars, quartz, limestone, steatite, cryolite and fluorspar are used more or less, together with, for glazing, the compounds of lead, zinc, barium, boron, potash and soda. Some of these substances are easily fusible, others resist the action of very high temperatures and the remarkable variety of ceramic products is due to the possibility of wide variation in the nature of the compounds. Two things are, in the main, necessary, a sufficient resistance to the action of fire and a sufficient yielding to produce the solidity due to partial fusion. Some clays, such as those used for brick or terra cotta, possess both these properties naturally balanced, others, such as the white clays used for porcelain and fine earthenware, possess only the refractory nature, the yielding to heat must be induced by an admixture. Thus all white wares are more or less artificial in that the material is not found in nature ready for use. In fact almost the only wares which are made from unmixed clays are bricks, roofing tile, pipes for drainage and conduits for wiring.

Arretine Bowl—Roman

Red Arretine pottery, depicting, in relief, men fighting bears. This piece bears the stamp of Marcus Perennius. First century B.C. to first century A.D.

DEVELOPMENT OF CERAMICS

The development of clay-working among the nations has been through similar phases in all parts of the world although in some cases the beginning has been with the brick, in others with the pot. Broadly speaking the brick was evolved from adobe and was manufactured only under climatic conditions such as make sun-dried clay a possibility. The pot was evolved from the basket, leather or bark vessel and was made by primitive peoples in many parts of the world. Possibly sun-dried pots were made at the first but no specimens remain. The origin of burning or baking the clay is unknown. The Britons placed pots in the funeral pyre and afterwards collected the bones and buried them in one of the vessels, using others to contain food and water.

While the earliest pottery was shaped by hand alone, numerous examples formed on the potter's wheel have been found in settlements dating from 4000 B.C. The wheel of that period was very crude but the evidence of its use is definite.

The Greeks. As producers of pottery from natural clays the Greeks were supreme. Thousands of their vases are now to be seen in museums. The work is classified under certain well marked styles. The earliest wares were plain or simply decorated with bands; then came the Geometric style in which, as the name implies, the pieces were covered, more or less completely, with lines arranged in angular patterns. This was succeeded by the black figured ware in which animals, birds and human figures were painted in black silhouette upon the brown or red clay. The finest period was that of the red figured ware in which the black pigment was used as a background the figures being reserved in the natural red. All these wares are fired only once, the pigment being laid upon the unburned clay.

The Romans. The Roman potters carried their art into many lands using often local clay. The black ware commonly known as Upchurch from the locality in England where much of it has been found was made of a common red clay and was turned black in the burning by the action of smoke. Castor ware is a variety which is characterized by painting in white clay upon a black or brown body. Arretine ware was molded from a bright red clay and glazed. None of these ancient wares has been perpetuated with the possible exception of the Castor ware which may have been the remote ancestor of the early English slip decorated wares. The treatment is similar though there does not seem to have been any continuity of production.

Chinese Influence. The whole trend of the pottery idea was changed by the influence of Chinese porcelain upon the Western world. Up to about the thirteenth century dark colored wares from natural clays had been made exclusively but as soon as the porcelains of the Chinese became known through the channels of trade the whole ceramic world strove for the production of white pottery. In the Near East the expedient was adopted of coating the dark clay with a white veneer of ground quartz mixed with a little pipe-clay. The knowledge of this process was confined to the Persians, Arabs and Moors but upon the invasion of Spain by the last named people the ware known as Majolica was originated. The characteristic feature of this is a glaze rendered opaque by the use of tin oxide which serves, as did the earlier white veneer, to conceal the dark colored clay of the body. Nearly every country in Europe participated in this development. The Majolica of Italy, the Delft of Holland, and the different styles of faience made at Nevers, Rouen, Moustiers and other places in France are technically almost identical. Wide differences are, of course, apparent in design and form but the essential technique is the opaque tin enamel.

Lykaon Vase

Greek red-figured vase, amphora. Fifth century B.C. Warrior bidding farewell to his family. Attributed to the "Lykaon painter."

Majolica derives its name from the island of Majorca in the Mediterranean whence these wares were exported. The term was first applied only to the lustered pottery which originated in Spain and was afterward made with such great success in Italy, but it is now generally used for all wares with the stanniferous enamel or tin glaze. Whether the knowledge of this was carried from Spain to Italy or was communicated to the Italian potters by Oriental workmen is a debatable point. In any case it was in Italy that the art reached its fullest perfection. The names of Luca della Robbia, Giorgio Andreoli and even Michelangelo himself are connected with this product while it is from the town of Faenza that the word *faience* is derived. The world is fortunate in possessing a manual of the potter's art in Italy during the sixteenth

century by Piccolpasso, a contemporary writer. In this most exhaustive work detailed information is given as to the production of the wares of the time and every modern writer has drawn liberally upon this source.

Soft Porcelain may be said to have grown naturally from Majolica, first in Italy where the rare Medici porcelain was made about the year 1580, and afterward in France at St. Cloud in 1695, at Chantilly in 1725 and at Vincennes the forerunner of Sèvres. The aim of the early porcelain makers was to produce a translucent white ware which should approach the Chinese masterpieces in appearance. No pure white clay had then been discovered in Europe so that the result had to be accomplished by artificial means. A mixture was made of sand, gypsum, salt, alum and niter and was fused in crucibles to a solid slag known as "fritt." This was then ground

Italian Majolica

Tazza, Italian, sixteenth century (1524?), Gubbio; Maestro Giorgio (maker). Predominately blue and green with ruby and gold luster.

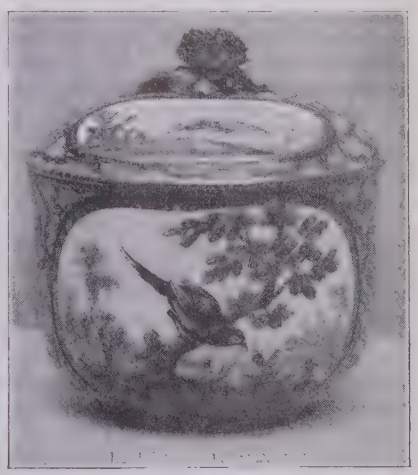
to a fine powder and to it was added a small portion of a plastic calcareous clay. This clay tended to darken the color so that it was not possible to use enough to impart a working plasticity to the mass. Hence the porcelain makers were driven to use such emollients as soap and mucilage before the paste could be shaped. So tender was this ware in its resistance to fire that heavy losses were experienced in the kilns and it was eventually superseded by the hard porcelain which now constitutes the staple European product. No more beautiful ware than the French "pâte tendre" has ever been made. The glaze was a very fusible glass composed largely of lead oxide and, consequently, the paintings, which were executed with consummate skill by artists of repute, sank into the glaze in the burning and acquired their lustrous beauty. To this fact is also to be attributed the superb quality of the ground colors, the inimitable turquoise, the apple green, the rose du Barry and the blue du Roi.

Development in France. France gave birth, in the sixteenth century, to two notable departures from the established methods. These were the faience known as Henri II and the ware of Bernard Palissy. The former has been the subject of much discussion as to its place of origin. It was first attributed to Helene de Hangest who was a woman of refined taste, the chatelaine of the Chateau of Oiron. It was said that she and her librarian together made this pottery as a labor of love. Only about sixty pieces are now known to exist. The characteristic feature of the ware is that a light, yellowish clay is inlaid, somewhat after the method of a bookbinder, with clays of darker color, the whole being covered with a transparent glaze. Other locations have been given to this ware but the name Henri Deux is accepted as the most satisfactory.

Bernard Palissy was born in 1510 and his life has inspired many a theme. His aim was to make a perfect white enameled pottery and though he struggled for fifteen years he never realized his purpose. He made, however, the beautiful colored glazes which will always be associated with his name. Being a devoted student of nature he modeled reptiles and fishes on his platters and covered the clay with glazes in the natural colors.

Neither of these two wares had any appreciable effect upon the ceramic industry nor is either of them made at the present time.

Hard Porcelain. Chinese porcelain is generally conceded to be the criterion, as it is the prototype of this class of ware. The ingredients are the pure clay known as kaolin, feldspar and quartz. The glaze is composed of lime, clay, feldspar and quartz. Both body and glaze are burned together at a very high temperature. The perfection of the work of the Chinese potters was reached between the fourteenth and the seventeenth centuries to which period most of the finest pieces are referred. It was this porcelain which inspired the European connoisseurs as already stated. France led the way at St. Cloud with a purely artificial ware but the first hard porcelain made in Europe must be accredited to Saxony. In the year 1709 one Johann Friedrich Böttger, being employed as chemist by the Elector of Saxony, was shown some infusible, white earth. He had become interested in porcelain through the fine collection of Chinese and Japanese wares in the possession of the Elector and at once essayed its production. The result was the famous porcelain of Meissen, also known as Dresden. The production of porcelain now became the passion of princes. One after another the rulers of the German states established studios or small factories in which the fashionable art could be pursued. Vienna, Höchst, Berlin, Nymphenburg and many other places became centers of production, but in the majority of cases the work ceased upon the death of the patron. Meissen, Vienna and Berlin still flourish together with a large number of modern manufactories which are successfully producing commercial wares.



Kaolin or porcelain clay was discovered in France in the year 1768 and after some experiments the manufacture of hard porcelain was begun. For some years both wares were produced at Sèvres but in 1804 the soft paste was finally abandoned.

ENGLISH PORCELAINS

England soon became involved in the passion for porcelain, three manufactories being established within a very brief period. These were Bow (1744), Chelsea (1748), and Worcester (1751). The work of each was in almost close imitation of the French in technical treatment but influenced by the Chinese as to motive. The china made at Bow contained as one of the ingredients a white earth which was imported from America, from the "back of Virginia" a locality whence china-clays are now procured. There was a factory in Derby which was flourishing in 1756 though the exact date of its origin is unknown. Worcester, now known as "Royal Worcester" is the only one of these establishments which survives, though a new factory has been set up at Derby.

Hard porcelain in England has had but two exponents. When, in 1756, William Cookworthy discovered china clay in the county of Cornwall he set up a factory at Plymouth, the nearest important town, for the purpose of using the clay. He made a kaolinic porcelain after the manner of the Chinese but so imperfect were his methods that a piece of Plymouth porcelain without a flaw is unknown. The venture did not succeed and in 1770 the factory was removed to Bristol where Richard Champion was already engaged in making a similar porcelain. The works at Bristol are now engaged in the manufacture of earthenware only.

About this time the characteristic English china was perfected. This is known as "bone china" from the fact that the paste contains about forty per cent calcined bone. This ware differs from both soft and hard porcelains and may be regarded as a compromise.

French Soft Porcelain

Sèvres soft porcelain (pâte tendre) sugar bowl (part of a set). Eighteenth century (1761?). In 1759 Louis XV became sole proprietor of the Sèvres factory.

It is not as tender as the French soft paste and is glazed with a compound which is much softer than that necessary for hard porcelain. Much of the success of English table wares may be attributed to the quality of this china.

English Types. While the manufacture of porcelain came to England as an alien art the production of pottery is indigenous to the soil. From the days of the ancient Britons there were potters in the land. They wrought the native clays and evolved the slip painted wares, the combed and marbled wares, the tortoise shell, the agate and the mottled of modern museums. They also made a beautiful white stoneware, glazed with salt after the German fashion and decorated with trans-

parent colors. From the ranks of these men arose Dwight and Toft and Astbury and Whieldon to be topped in turn by Josiah Wedgwood. The potters foregathered in North Staffordshire where clays and coal were abundant and thus were founded the Staffordshire potteries, a federation of small towns which have separate entities but one interest. Here are the famous Minton, Copeland, Wedgwood, Doulton, Meakin, Johnson and a hundred other flourishing factories whose wares are on every table. Nearly all of the English potters make both china and earthenware. The latter is a white ware, light and porous, which is much cheaper than china. Native clays are almost exclusively employed but feldspar is imported from Sweden.

The type of ware known as "Grès de Flandres" originated in Germany and was exported from the low countries, hence the name. It was also, from its hardness, known as "stoneware" and was the forerunner of the recent wares of this type. The first glazing was by a unique and previously unknown process. When the pottery was in the kiln and at a glowing heat a quantity of common salt was thrown upon the fire. This was vaporized by the heat and the fumes attacked the hot clay forming a glassy coating over the surface. This process, while still in demand for decorative wares, has been superseded in the manufacture of common jars by a cheaper method.

POTTERY IN AMERICA

The aboriginal pottery of the United States constitutes a rich field of study to those who are specially interested, but it has no connection whatever with the product of the present day. American pottery apart from the work of the Indian began with the industries of the early settlers in Virginia and Pennsylvania. Brick and roofing tile were probably the first to be made for there is evidence that in Virginia brick were burned in the year 1612, and Professor Morse states that the German immigrants to Pennsylvania introduced the manufacture of roofing tile after the German pattern. Very early in the settlement of the country white or light colored wares were made by those who brought with them a knowledge of the potter's art. Native clays were used, but at that time the country had been so little explored that the finer clays were unknown. Naturally the potters settled where the clays were found and so the pottery centers were established. As a foil to the importation of American clays by English potters it is related that Josiah Wedgwood was greatly exercised in mind over the fact that an English workman named Bartlem emigrated to South Carolina in 1766 and attempted to establish a pottery there. Wedgwood, in a private letter, deplored this, stating that "an amazing quantity of white stoneware" was being exported to the "continent of North America" and expressing the fear that if English potters should begin to practice their art in the "colonies" the trade of the mother country would suffer. Recent developments have shown that his fears were without foundation.

Eighteenth Century. During the eighteenth century a number of small potteries were established in the Eastern counties of Pennsylvania, mainly by the German settlers. Dr. E. A. Barber has made a special study of the wares produced in this district and has written a good deal upon the subject. He thus describes the process of "sgraffiato" as practiced by the Pennsylvania potters—"The decorative process consisted in covering the red clay with a thin layer of lighter colored slip, through which the designs were scratched with a style to expose the darker color below. A coating of transparent glaze, slightly clouded with green and yellow oxides, was then applied to the surface, and, after the final firing, the ware presented the appearance of a rich red intaglio beneath a greenish or mottled-yellow ground."

The slip decoration which was a contemporary of this consisted in using a fluid clay as a pigment. It was usually a light clay painted upon a darker surface but the reverse

Chelsea Plate

Chelsea porcelain (1750-1775), English. Molded rocaille rim, gilded, with exotic birds and flowers.

was also used. Many interesting pieces of these wares are to be found in most museums.

Nineteenth Century. During the opening years of the nineteenth century attempts were made in many parts of the eastern states to establish the industry of pottery manufacture. At first the potters paid but little heed to the location of the clays, thus departing from the practice of their predecessors. Stoneware was attempted in more than one place in New York state where no stoneware clays are to be found. Gradually, however, the matter of the raw material prevailed and segregation began. The first pottery in East Liverpool, Ohio, now one of the most important seats of the industry, was built in 1839 by James Bennett who selected this location on account of the superior quality of the clay for the manufacture of yellow ware. It is interesting to note, as an evidence of the progress of the art, that while this clay is still used, the bulk of East Liverpool wares are now made from clays found elsewhere. Mr. Bennett was joined by his three brothers one of whom, the late Edwin Bennett of Baltimore, was in 1851, the originator of the well-known teapot with the bas-relief of Rebekah at the Well, a design which has been copied by teapot makers all over the world. The next few years saw some important developments. Men bearing the now well-known names of Harker, Taylor, Goodwin, Knowles, Vodrey and Lee settled on the Ohio river and built their kilns until there are now in East Liverpool nearly fifty establishments engaged in the manufacture of clay products.

The first kiln in Trenton, New Jersey, was set up in the year 1852 by Taylor and Speeler, according to Barber. As in the Ohio field the first product was yellow ware made from local clay. In order to improve the quality of the wares extensive search was made for better material with the result that kaolin deposits were found in Delaware and Pennsylvania. Feldspar was also found in Pennsylvania and quartz in Maryland. The potters, coming for the most part from England, were able only with difficulty to adjust themselves to the new materials and heavy losses resulted. Gradually, however, the obstacles were overcome and distinctive wares developed. One of these, known as "Hotel China" is a fine earthenware which closely approaches hard porcelain in character, being white and translucent. This ware is in constant demand wherever severe usage is expected and under such conditions it has no superior. The body is composed of kaolin or porcelain clay, a plastic clay known as ball-clay, feldspar and quartz. The glaze is a compound of lead oxide, lime, potash, soda, boron sesquioxide, alumina and silica. These ingredients, when melted, form a hard glass which protects the body and offers great resistance to wear. The decoration is usually printed beneath the glaze and therefore lasts as long as the china itself.

Belleek. Another development was the soft porcelain known as "Belleek." The name is that of a village in Ireland where a porcelain of similar character was originally made. Not finding any natural substance which would fuse at a sufficiently low temperature, the experimenters, Messrs. Brewer and Bromley, constructed an artificial feldspar or "fritt" to which they added a sufficient amount of plastic clay, thus following the plan of the early workers in France. Belleek ware is of a soft yellow color and is usually made extremely thin. It is much in demand for decorative pieces but is too tender for severe use on the table. The demands of recent years have given rise to the manufacture of sanitary goods in large quantities, some important concerns being exclusively engaged in their production. A strong earthenware is extensively made for general trade, constituting, in fact, the bulk of the household pottery used in the country.

American Decorative Pottery. In pottery which claims to be decorative and ornamental, America has achieved some notable results. The general type of wares made is best defined as faience, that is, glazed earthenware produced at a low or moderate temperature. The glazes are both brilliant and matt and the decorations are either beneath the glaze or consist in colors added to the glaze itself. The pioneer in this field has been the Rookwood Pottery Company of Cincinnati, Ohio.

Rookwood has become, by reason of the variety and technical excellence of its products, a household word among ceramists and a study of the career of the concern will prove to be very instructive. In addition to the production of rare and beautiful vases in the standard brilliant glaze, Iris, matt glaze

and the inimitable vellum, Rookwood has embarked in the manufacture of tiles and architectural faience. Some very important works in interior decoration have been carried out in the cities of the Middle West and it is evident that there are unlimited opportunities for development.

In addition to a number of factories, large and small, where wares of similar character but of less artistic value are being made, there has sprung up a vogue of individual craftsmanship. Many artists are designing and producing decorative wares of originality and beauty for which there is a fair demand.

Commercial and Structural Pottery. In structural pottery, brick, roofing tile and terra cotta, great progress has been made in America in recent years. Common brick, made from soft clay in wooden molds, stands first as to quantity for all structural work needs it in the concealed parts. Many alluvial clays are used in the manufacture.

Refractory wares such as firebrick, tuyeres, locomotive blocks, gas retorts and furnace linings in general form an important section of the ceramic field.

Architectural Terra Cotta is now recognized as the most satisfactory fire-proof building material. For the most part the coal-measure clays are the best because of the demand for light colors. These clays are buff colored when burned and therefore do not destroy the light surface tints as red clays would. All terra cotta is either glazed with a dull face or coated with a thin film of prepared clay which both secures uniformity of tint and also the desired color effect. The surface is impervious to water and is easily cleaned. The weight of the pieces makes it impossible to dip them in the liquid so that the coating is sprayed on by means of compressed air.

Electrical Porcelains. Recent advances in the use of electric power have made it necessary to transmit high tension currents for long distances. This has created a large demand for insulators capable of resisting the strain. Glass, while suitable for currents of low voltage will not, on account of the irregularities of structure caused by rapid cooling, stand the heating which is inseparable from the transmission of currents at high pressure and recourse has been had to porcelain. The body structure is the same as that used for all porcelain wares except that color is not of great importance. It is found, however, that the white porcelains are the best because they can be burned at a higher temperature than those of impure color, in fact the color of the ware is an indication of the purity of the clay. The wares are glazed with the lime-feldspar compound already mentioned and are burned at an intense heat, approximating 1400 C. They are tested under an enormous voltage for the detection of flaws.

The arrival of the automobile and the airplane has created a large demand for porcelain spark plugs. These are made in several varieties according to the requirements of the case. The operations have been so standardized as to be almost entirely automatic and great mechanical perfection has been attained.

TABLE I. POTTERY AND EARTHENWARE

Country	Date	Nature of Product	Remarks
Egypt	B.C. circa* 3000	Unglazed pottery.	Household vessels, mostly wheel made.
Egypt	1900	Glazed stoneware.	Rich blue glaze. Figures and charms molded.
Assyria	800	Unglazed pottery.	Utensils both hand and wheel made.
Assyria	700	Inscribed tablets.	Cylinders and slabs with impressed letters.
Babylonia	700	Unglazed pottery.	Utensils.
Greece	1800	Pottery, Minoan.	Primitive decoration. Wheel made.
Greece	700	Polished pottery, also called Mycenaean.	Geometric style. Interlaced lines in dark color. Wheel made.
Greece	600	Polished pottery, also called Mycenaean.	Wheel made. Archaic style. Birds and animals in black silhouette, the details scratched in
Greece	600	Polished pottery, black figured ware.	Wheel made. Human figures in black, faces in profile, eyes fronting.
Greece	500	Polished pottery. Red figured ware. Finest period.	Wheel made. Background in black, figures in natural color of clay. Faces and eyes in profile; drapery in detail.
Greece	400	Polished and ornamental ware. Decadent period.	Figures and embossments in color.
Rome	100 to A.D. 40	Black and gray ware, called Upchurch from the English locality where much is found. Found also in France and Germany.	Wheel made. Lines polished. Black color produced by smoke in burning.
Rome	A.D. 40	Dark ware with white decoration. Called Castor from the English locality.	The beginning of "slip" painting. Hunting scenes and scrolls.
Rome	40	Samian or Arretine ware.	Bright red glazed pottery. Molded with decorative scenes and scrolls.
India	900 et seq.	Pottery of natural clay with colored glazes.	Wheel made. Decorated with floral arabesques under the glaze.
Japan	200	Common pottery glazed and unglazed.	The art introduced by Korean potters.
Persia	1300	Engobe or slip coated pottery.	A natural dark clay covered or veneered with a white coating, colored and glazed.
Persia	1400	So-called "Gombroon ware," attributed to Chinese influence.	A porcelaneous earthenware of fine quality. Perforated and filled in with semitransparent glaze. Sometimes decorated in blue.
Syria and Arabia	1400	Engobe ware of the same general type as the Persians.	Decorated under the glaze with fine arabesques in color.
Asia Minor	1500	Engobe ware of the same general type as the Persians.	Characterized by the use of a red earth as a pigment.
Spain	1320	Tin enameled ware, known as Majolica.	A dark natural clay covered with an enamel opacified by tin oxide. Lustered and decorated in color.
Italy	1350	Tin enameled ware, known as Majolica A most extensive and important product which emanated from many centers.	Elaborately decorated in color and embellished with rich paintings. Lustered and sometimes with a brilliant overglaze.
Italy (Luca della Robbia)	1450	Architectural modeled work coated with the characteristic tin enamel.	Luca della Robbia is believed to have greatly improved the quality of the enamel.
Italy (Giorgio Andreoli)	1520	Ruby pots, dishes and platters.	The Maestro Giorgio worked at Gubbio and his ruby lusters are unique.
France (Nevers)	1580	Tin enameled wares in Italian style.	The maker of these wares came from Faenza, hence the term "faience."
France (Rouen)	1540	Tin enameled wares of superior quality.	The style is entirely French. Figures and conventional ornament.
France (Moustiers)	1680	Tin enameled wares of superior quality.	Painted with hunting and domestic scenes on a very pure enamel.
France (Henri Deux)	1520	Glazed cream-colored pottery, inlaid with dark clays.	Also called Faience d'Oiron from the supposed place of origin. A very rare and valuable ware; only fifty-three pieces are known.
France (Palissy)	1560	Light colored earthenware with richly toned glazes.	Modeled embossments of natural objects glazed in proper colors. Also some modeled figures.
Germany	1540	Salt glazed stoneware.	Brown, gray or cream clays, embossed and sometimes decorated in blue.
Holland	1600	Tin enameled pottery decorated in blue.	The well-known delftware.
England	B.C. 400	Primitive hand-formed pottery.	Used in funeral ceremonies and found in burial mounds
England	A.D. 490	Anglo-Saxon pottery.	Crude and unglazed.
England (Malvern and other places)	1250	Encaustic tiles. Parti-colored clays.	Made for church use, by the monks.
England (Fulham Mortlake and Staffordshire)	1550	Salt glazed ware.	The knowledge derived from Germany.
England (Staffordshire)	1610	Lead glazed pottery on colored clays.	Primitive in character. Either wheel made or shaped by hand.

* **Circa** or **ca.**, meaning "about."

TABLE I. POTTERY AND EARTHENWARE—Continued

Country	Date	Nature of Product	Remarks
England (Wrotham and Staffordshire)	1620	Slip decorated wares	A characteristic English product. Dark clay with ornamentation in light-colored slips.
England (Lambeth, Staffordshire, Liverpool)	1635	Tin enameled wares	Introduced from Holland.
England (Staffordshire)	1680	Combed and marbled wares in parti-colored clays	A domestic pottery largely made in cottage homes.
England (Etruria)	1762–1776	Wedgwood wares, queensware and jasper	The beginning of modern manufacture.
England (Leeds)	1770	White earthenware	Perforated and glazed.
England (Staffordshire)	1784	Willow pattern, introduced by Spode	Spode was the forerunner of the house of Copeland.
England (Lambeth, Doulton)	1818 (still working)	Stoneware	A salt glazed ware, decorated in sgraffiato and otherwise commonly known as "Doulton ware."
England (Staffordshire, Furnivals)	The date of origin of these factories is unknown		A fine quality of earthenware for table use.
England (Staffordshire, Meakin's)	They developed from the domestic industry of the seventeenth century		An excellent earthenware, largely in demand for table services.
England (Staffordshire, Johnson's)			One of the best of the English earthenwares.
China	A. D. circa. 800	The first hard porcelain	Porcelain was a gradual development. The first undoubted product appears in the Sung dynasty.
China	1368	Ming dynasty. The finest period	The works of this time constitute the crowning glory of Chinese porcelain.
China	1661	"Famille vert." (Jacquemart)	The porcelain was finished and glazed in the usual way, then decorated in black and covered with a fusible green enamel.
China	1723	"Famille rose." (Jacquemart)	Overglaze decoration in which a rose color made from gold is the characteristic feature.
Italy (Florence)	1580	A semihard porcelain with blue decoration	The famous and rare Medici porcelain. Only twenty-six pieces are known.
Italy (Capo di Monte near Naples)	1743	Soft porcelain	Modeled figures colored over the glaze.
Spain (Buen Retiro)	1760	Soft porcelain	Removed from Capo di Monte when King Charles of Naples became King Charles III of Spain.
France (St. Cloud)	1695 to 1773	Soft porcelain	The first French porcelain.
France (Vincennes)	1745	Soft porcelain	Vincennes was the forerunner of Sèvres. In 1753 the king of France purchased one-third of the stock and gave the title "Royal" to the factory.
France (Sèvres)	1756	Soft porcelain (pâte tendre)	Removed from Vincennes. In 1759 Louis XV became sole proprietor.
France	1769	Hard porcelain (pâte dure)	Kaolin or porcelain clay was discovered at St. Yrieix in 1768 and the production of hard porcelain followed. The pâte tendre was finally discontinued in 1804. The factory still exists as the most important national porcelain works in the world.
France (Limoges)	1779 et seq.	Hard porcelain	The famous works of Haviland, Guerin, Pouyat and others now manufacture very large quantities of the well known French china.
Germany (Meissen or Dresden)	1709	Hard porcelain	No porcelain was made in Germany until the discovery of kaolin. Böttger was the first man to make hard porcelain in Europe.
Germany (Vienna, Anspach, Bayreuth, Höchst, Fürstenberg, Berlin, Frankenthal, Nymphenburg, Ludwigsburg, etc.)	1718 to 1758	Hard porcelain	Nearly every German prince desired a porcelain works during this period. There is not much to choose between the wares as regards quality, but the decorations, largely over the glaze, bore different characteristics. Few of these factories are now in existence.
Denmark (Copenhagen)	1760	Soft porcelain	This factory was closed in 1768. The paste is good and the painting of excellent quality.
Denmark	1772	Hard porcelain	Became a royal manufactory in 1779. Is now noted as one of the first in the world.
England (Bow)	1744	Soft porcelain	Bow was at one time called "New Canton." It is believed that bone ash was here first used in English china. The factory was closed in 1776 when Duesbury removed the equipment to Derby.
England (Chelsea)	1745	Soft porcelain	Patronized by the king and the duke of Cumberland. The style of treatment was French. Purchased in 1769 by Duesbury and the equipment removed to Derby.
England (Derby)	1750 (uncertain)	Soft porcelain	Derby was concerned in the making of china probably as early as 1745. In 1769 Duesbury combined with the Derby works the resources of Bow and Chelsea. Hence the term Chelsea-Derby.
England (Derby)	1877	Bone porcelain and other wares	Edward Phillips of the Worcester factory built the new Derby works and began the manufacture of "Royal Crown Derby" porcelain. The factory now stands among the foremost in England.
England (Worcester)	1751	Soft porcelain. Ivory porcelain. Bone porcelain	Founded by Dr. Wall and for a time occupied chiefly in producing Chinese patterns. Consolidated with Chamberlains in 1840. The present company formed in 1862 and now manufactures the famous Royal Worcester wares.
England (Coalport)	1814	Soft porcelain. Bone porcelain	The successor of Jackfield and Caughley. This factory is still in existence and produces fine wares.
England (Plymouth)	1768	Hard porcelain	This, the first factory in England for the manufacture of hard porcelain, was established by Cookworthy as a consequence of the discovery of porcelain clay in Cornwall. Removed to Bristol in 1771.
England (Bristol)	1768	Hard porcelain	Champion began to make porcelain in Bristol and in 1771 purchased the Plymouth patent. The works still exist, but for the production of earthenware only.
England (Burslem, Doulton)	1880 (still working)	Bone porcelain and other wares	The factory of Pindar, Bourne & Co. was purchased by the firm of Doultons, Lambeth and the work produced now ranks with the first of English wares.
England (Stoke-on-Trent, Mintons)	1793 (still working)	Bone porcelain, earthenware and pottery	Begun as a manufactory of earthenware, the house of Minton, under the leadership of Campbell and Arnoux, took the lead in the well known Staffordshire potteries. The wares are of the finest.
England (Stoke-on-Trent, Copeland)	1779 (still working)	Bone porcelain, ironstone china and other wares	Copeland was the successor to Spode. Considerable success has been achieved in all kinds of table services. Ornamental wares have been made also.
England (Cauldon Place, Brown-Westhead, Moore & Co.)	1794 (still working)	Bone porcelain and earthenware	The present house is the successor of Ridgway & Sons. They are noted for china dinner ware.
England (Etruria, Wedgwood)	1762 (still working)	Bone porcelain and earthenware	The original house of Wedgwood has taken up and developed all the modern styles with much success.

GLASS

Some authorities have objected to the inclusion of glass under the term "ceramics" believing that only clay wares should be so classed. The fact is, however, that the difference is only a matter of fire. Any mixture of clays and rocks such as constitutes a ceramic product can be made into a glass if fused at a temperature sufficiently high. The art of the ceramic worker involves the ability to adjust composition and temperature to each other so as to achieve the desired result. The same limited range of materials is used in each case, varying only in respective proportions. Glass consists essentially of silica, lime, soda, potash, the oxides of lead, zinc, barium and boron with or without small quantities of alumina. Not all of these are present in any one compound. Thus window, plate and bottle glass contain silica, soda and lime. Flint glass contains silica, lead oxide and potash while optical glasses contain some or all of these with proportions of the other oxides named.

The ingredients are carefully weighed and mixed. Small batches are melted in clay pots shaped for the purpose from which the workers gather the material as required. In mass production huge tanks are built of refractory clay blocks. The mixture is fed to the tanks at one end and the workers or machines gather the molten glass at the other. None of the other ingredients named contributes color to the glass batch. Colors are produced by the oxides of cobalt, copper, iron, manganese, nickel or chromium. Ruby glass is colored by gold or selenium. Opal glass contains opacifying substances such as the oxides of tin, antimony and zirconium.

History. The origin of glass is lost in obscurity. Pliny, the historian, relates that certain Phoenician mariners landing upon the Syrian coast took from their vessel some blocks of soda in order to support their cooking pots; that the soda fused by the fire and glass was formed with the sand of the beach. Perhaps the blocks were the soda bearing rock known as "trona," common in Egypt. It seems more likely that glass originated during the firing of pottery for many clays and rocks are quite fusible. It is certain that glass was known in Egypt as early as 2600 B.C. for on the tombs at Beni Hassan there are drawings of glass-blowers at work. Glass from Egypt or Greece is not common but in Roman times there was a large production. The glass is not clear even when uncolored. Some coloring oxides were used but the brilliant prismatic colors familiar in museum collections are the result of disintegration, the material was imperfectly fused and the influence of atmosphere or earth has brought about a separation of delicate films through which light is refracted. The Romans also made window glass. Stained glass, such as that used in church windows was produced in its greatest beauty between the twelfth and sixteenth centuries.

While glass for table and household use was made quite extensively in the Near East during the Middle Ages there was no great improvement or development until the sixteenth century when all the arts were stimulated by the great Renaissance. Venice took the lead. It is said that the purity of the sand on the island of Murano led to the establishment there of the industry. Venetian glass has long been regarded as the finest exemplar of the art. The industry was soon developed in Germany, France and England but generally with a more utilitarian purpose. Bohemian table glass is unexcelled and of late years the English factories in London and Stourbridge have produced some of the most beautiful examples. In America fine cut glass and beautiful decorative glass are made at Corning, N.Y., and at Long Island studios, but the predominating output consists of bottles, window glass, plate glass, chemical glass, cooking ware, railroad signal lights and optical glass.

Modern Glass Making. Bottles are blown into molds by the use of compressed air. This is accomplished by complicated automatic machines. Window glass is drawn out in cylindrical form. The cylinder is split and flattened. Plate glass is poured upon a large iron table and rolled out to the desired thickness by a metal roller which runs on guide bars. Optical glass is sometimes made by the same method, sometimes by allowing the melting pot to become cold. The pot is then broken and the glass fragments shaped, ground and polished. The primitive mouth-blowing method is now almost confined to decorative and ornamental glass.

All ceramic illustrations are by courtesy Metropolitan Museum of Art.

TABLE II. GLASS

Country	Date	Nature of Product	Remarks
Egypt	B.C. circa 2400	Dark blue glass. Semi-opaque.	The earliest dated specimen is a small lion's head in the British Museum.
Egypt	1450	Transparent green glass.	A bead found at Thebes.
Nineveh	712	Pale green transparent.	A small vase in the British Museum bears the name of Sargon, king of Assyria.
Greece or **Phoenicia**	circa 400	Colored glass. Waved, striated and sometimes carved.	Numerous small bottles. Beads and ornaments.
Rome	circa 30 B.C. to 309 A.D.	Common green glass. Colored and ornamental glass, carved, cut and woven glass.	Enormous quantities of glass of every description, even including window glass, were produced.
China	circa 140 B.C.	Small vessels ornamented and embossed.	The statements regarding early glass in China are very uncertain. But few specimens remain.
Constantinople (Byzantium)	A.D. 800 to 1200	Heavy molded glass in dark colors. Some window glass.	Classic models were followed, but the wars of the period caused much interchange of plunder, and the origin of many specimens is doubtful.
Damascus and the East	1200 to 1400	Vessels of clear glass often richly ornamented.	Many lamps and vessels for religious use are found in mosques.
Italy (Venice and Murano)	1090	Every description of fancy glass.	Glass mosaics preceded the general manufacture of glass in Venice. The furnaces were removed to Murano probably about 1300. Venetian glass is the model for the world.
Italy (Murano)	1490	Mille fiore (thousand flowers) glass.	This had been made by the Romans. Canes of colored glass were cut into short lengths and these, with the cut ends showing, were fused into the body of the vessel.
Italy (Murano)	1500	Vitro-di-trina (lace glass).	Threads of opaque white glass were fused in a geometric pattern into the clear glass of the vessel.
France	A.D. circa 500 to 800	Glass vessels.	Scarcely any specimens remain. The work was probably of Roman origin.
France	1400 to 1600	Utensils of various sorts colored and decorated. Window glass.	Small manufactories of glass existed in many parts of France but most of the product was unimportant.
Spain	circa 500 to 800	Cups, vials and bottles.	As in the case of France, the Roman influence was felt in Spain.
Spain	1400 to 1600	Utensils and drinking cups.	Some Spanish glass bears evidence of Venetian influence. Colored and reticulated forms are found.
Germany	circa 700	Drinking cups.	The influence of Rome is apparent here also.
Germany	1400 et seq.	Steins and goblets. Window glass.	The stein was even then a feature in Germany. A great variety of form and treatment is found. Some highly ornate pieces are preserved.
Great Britain	circa 600	Beads, crude cups, window glass.	Both Roman and Saxon specimens are found. The original "tumbler" was a glass drinking horn which could not be set down until empty.
Great Britain	1300 to 1600	Cathedral glass. Vessels of many sorts.	En lish stained glass for church windows is of the finest. The vessels were generally plain and useful.

Modern Productions	
Italy (Venice and Murano)	The glass is much on the old style. Every description of colored, blown, woven and reticulated glass is produced. The material is still of the lime-soda mixture.
France	A great deal of modern French glass is crystal of the lead-potash compound. The molded glass is very fine. Some French craftsmen have produced wonderful effects in colors.
Bohemia	This glass is well known in the small and inexpensive bric-a-brac of the stores. A good deal of it is decorated in color and gold.
Germany (Jena)	In optical and chemical glass the Jena works lead the world.
England	The English glassmakers are surpassed by none. Table glass of pure crystal, cut glass and ornamental pieces are made in great variety. The Stourbridge district is the most famous.
America	Much of the American glass is molded in the form of tumblers and household vessels. Fine cut glass is made at Corning, Toledo and other places. Plate glass is an important part of the industry.

FURNITURE

THE history of furniture is so interwoven with that of the fine arts that separation is difficult. To understand the rise and development of furniture design the subject must be studied against an architectural and decorative background. Manners and customs and those events which influenced domestic life have had an important bearing on the evolution of household fitments.

Egypt is the cradle of many of the arts, and to Egypt we are indebted for the first light thrown on furniture making. Due to the preservation afforded by the dry air of tombs and temples it is possible to obtain a fairly adequate idea of early Egyptian designing. Excavations have brought to view examples of household equipment constructed of stone, metal and wood. On the theory that the souls of the dead would be aided in a future state by the presence of familiar objects of this life, burial places were filled with domestic furniture and utensils indicative of the rank, position and wealth of the deceased. In the tombs of kings have been found chairs, couches and tables made of ebony, cedar and sycamore, and sometimes ornamented with horn, ivory, silver and gold.

DEVELOPMENT OF FURNITURE

Egyptian. Egyptian art is symbolic, formal and full of restrained vigor. It reflects dignity and seriousness. It lacks the beauty of Greek art and the diversity of Roman, but contains principles which strongly influenced both. Although largely derived from natural forms, it is highly conventionalized. Motives which are repeated over and over, and often found in the embellishment of furniture, are the palm, the lotus and the papyrus. Other important symbols are the scarab or sacred beetle, the asp and the ram. Mythical figures in which wings are an important element appear in all forms of the decorative arts, as do borders composed of frets, circles, triangles, scrolls, leaves, buds and flowers.

Our knowledge of this remote era has been greatly increased by the many representations of domestic life discovered from time to time in the way of painted walls, carved friezes, and crude drawings on rolls of papyrus. Most of our large museums contain Egyptian sections where originals or replicas may be profitably studied. It is possible to obtain a clearer idea of the household art of this far-away day than of the art of several later periods, notably the Dark Ages. Roughly spanned by the sixth and ninth centuries, they have been called thus, as someone has suggested, because we are so in the dark about them.

Assyrian is similar to Egyptian, but not so fine in conception or workmanship. Neither climatic conditions nor the life of the people fostered its preservation. The Assyrians were more warlike, and expressed themselves accordingly. Woods and metals, as well as marble and stone, were employed in the construction of their household furniture. We are indebted to the Bible for much of our insight into the life and times of the Assyrians and the Babylonians with Nineveh and Babylon as the two great centers. The Babylonians were builders of temples, palaces and hanging gardens. Again museums have much to offer the student of these ancient peoples. Plaster casts of friezes found in the palaces of the Assyrian kings impress us with the spirit and action of the participants. Decorative details suggest Egyptian sources, but expressed with greater force and with more dependence on animal forms. The bull, the lion and the griffin predominate, often with human faces. It is a symbolic art, but turned to the pursuit of war rather than peace.

Among the Greeks. Greek art was the supreme expression of its day, and has remained the standard by which we measure proportion, order and beauty. While embodying many of the motives of Egyptian ornament, it developed on lines of greater purity. As a race, the Greeks strove to express beauty in every phase of living and to endow every object with utility and grace.

St. Peter's Chair

One of the earliest examples of wooden furniture. This famous example of ancient wood carving shows a strong Byzantine influence.

The anthemion or honeysuckle, the laurel and the acanthus occur frequently in decoration, together with such borders as the egg and dart fret, guilloche, Greek key, scroll and dentil. Furniture shows many of the characteristics of Egyptian and Assyrian pieces, but suggests a greater regard for line and a more refined feeling for ornament.

Our sources of information are many when we reach this period of the world's industrial history. Greek vases alone with their well painted figures and accessories throw much light on manners, customs and costumes.

Roman Furniture as with Roman architecture and Roman civilization, followed Greek inspiration; but the Roman character and the Roman approach to life differed widely. Carving, inlaying and veneering were known at this time, as was embellishment by means of elaborate mosaics. Among decorative motives may be mentioned all those previously listed with the addition of wreaths, swags or garlands, festoons, emblems of war, emblems of the chase, and many beautiful arrangements of leaves such as the oak, laurel, olive and cypress. The acanthus lost the severe lines of the Greek interpretation and became very complicated in its many foliations. The *curule* chair was the great Roman contribution to furniture making, and as such is worthy of a firm place in the history of domestic art. After the lapse of centuries, Napoleon revived this piece of furniture which is now usually associated with his name.

Pompeian. While Pompeian furniture hardly merits treatment as a distinct subject, it must be remembered that the excavations of entire rooms at Pompeii have added materially to our knowledge of Greek and Roman eras. In many instances walls with their decorations, floors and ceilings, as well as complete sets of furniture, have been found in almost perfect condition.

Byzantine Art. Following the fall of Rome, 476 A.D., we approach a long period in which classical motives are more or less submerged in the Byzantine, which combined Oriental influence with that of early Christian art. In 328 the Roman Emperor Constantine changed the name of the ancient city of Byzantium to Constantinople, and at the same time established Roman rule. Thus Byzantine forces had been, for more than a century, a factor in decorative schemes. This is a fascinating phase to the student of historic ornament, combining as it does Asiatic details with the primitive themes of Christian art; but it has little bearing on the subject of furniture. The same may be said of the Orient in general, and for this reason Oriental influences will not be dwelt upon now. The greatest gift of the Near East to household art was its rug weaving, and that of the Far East, its pottery and porcelain; but these topics, interesting and instructive as they are, lie outside the scope of this article. The famous chair of St. Peter at Rome, said to be the oldest piece of wooden furniture in existence, is an example of Byzantine work. It is inlaid in gold and ivory in an intricate and beautiful manner, the details of which are lost in the illustration.

Romanesque. The great architectural style of the early Middle Ages, the Romanesque, united a blending of late Byzantine and the last of the classic traditions with a more vigorous influence derived from France and the north of Italy. Architects make careful distinctions between French or Norman Romanesque and the development of the style farther south with its more pronounced Byzantine quality. Students of furniture will find that these phases form an important background to their subject and an interesting preface for the great Gothic era spanned by the twelfth and fifteenth centuries.

Gothic Handicraft. In order to understand the significance of Gothic art and its bearing upon all handicraft of the period, it is necessary to consider the conditions that gave birth to this last and greatest of medieval styles. The Romanesque type of building had long been the accepted model; the time was at hand for a change; as in all great innovations, the new movement swung far from the old; the pointed or Gothic arch

solved a problem of construction which the round or Romanesque arch failed to do; and finally the enthusiasm of the people, inspired by the Crusades and the attempt to win the Holy Sepulchre, sought to express itself in new forms.

The leading characteristics of the early Gothic style as applied to furniture designing were the pointed arch, the trefoil (three divisions), the quatrefoil (four divisions), and simple tracery. Furniture was massive, and Gothic motives were confined to ornament. Construction was at first little affected. The prominent features of the later Gothic style as expressed in furniture were the divided Gothic arch, the quatrefoil, the cinquefoil (five divisions), and an intricate scheme of tracery. The number of pieces in actual use at this period were chests of many varieties, cupboards, presses, stools, benches, chairs, bedsteads and bedstocks, the latter being built into the wall.

The Hall. During the twelfth and thirteenth centuries, both in England and France, the hall was the main room in the house—in many cases the one room of the dwelling. In the homes of the nobility it was a lofty apartment which served the purpose of both kitchen and dining room, and afforded the only living room. Meals were served on trestle tables, the lord and lady of the manor sitting on a dais, which elevated them a few inches above their guests.

Below the dais the long and narrow table was set with viands less costly than those served to the master and the mistress. Here were gathered the barons and the retainers. The placing of the salt divided the guests from the serving-people, and the expression, "below salt," is one which has endured until today. On the dais were chairs with high backs and canopies. The latter were convenient in case of rain, for the raftered roof was not always proof against the weather. Benches without backs for the guests, and stools for the servants, constituted the rest of the dining room furniture. Between meals the tables were placed against the wall, and the chairs drawn to the fire. At night the serving-men slept on pallets of straw on the hearth.

The Drawing Room. The fourteenth century added another room in the home of the affluent—a "withdrawing" room—the beginning of our modern drawing room. Here the mistress of the house with her ladies in waiting could retire when the music from the minstrels' gallery became too loud, or the jester's jokes too broad, or the drinking and fun too boisterous.

THE FIFTEENTH CENTURY

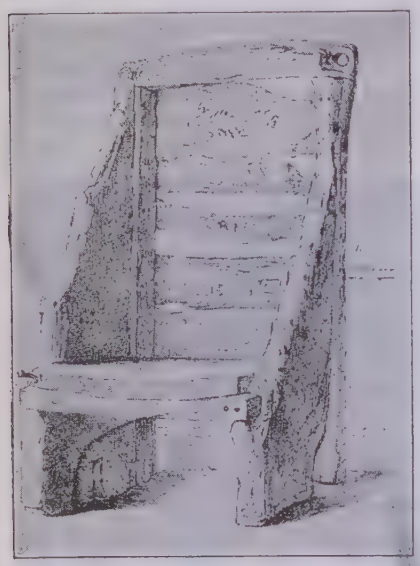
The fifteenth century was an important milestone in the march of progress. By this time the hall had lost its early character. It was large and often a meeting place for the owner and his friends; but as rooms multiplied, it ceased in turn to be parlor, kitchen and dining room. It was gradually approaching the great entrance hall of the seventeenth and eighteenth centuries. It retained its fine proportions and its lofty dimensions, but the raftered roof had given place to a beamed or vaulted ceiling. The big fireplace had grown more architectural, though still retaining its generous hearth. The rough walls were replaced by oak panels and fine tapestries, the latter imported from Flanders, for the day of the French looms had not arrived.

During this period, furniture was of two general types—movable articles which could be transported with ease, and massive pieces which could be left behind with safety. It would be a bold thief who would try to escape with a heavily carved chair weighing several hundred pounds and made more unwieldy by a wooden canopy. In the same way the bedstead of the day was also quite immovable, for it, too, was well incased in wood and finished with a canopy. Both canopies had the same origin—namely, to protect the occupant from rain in case the roof should not be sufficient shelter. And while the wooden canopies in a milder form survived long after better building methods came into existence, they had their beginning in defective house building. When houses became water-tight and air-tight, furniture gradually assumed different aspects.

Typical Interior of the Middle Ages
The fireplace in the center of the room still survives in Penshurst, England. From model in the Metropolitan Museum, New York.

Origin of Modern Chair. In the late fifteenth century, except in ecclesiastical chairs, the canopy was discarded. This straight back design was the ancestor of our everyday chair—although three centuries of furniture making intervened between the two. Flemish designers in the sixteenth century had an active hand in its evolution. They remodeled or revised the chair on new lines and sent it to England where, in the seventeenth century, it underwent other changes. But the part the old Gothic designers had in making all this possible must not be forgotten: they took the crude pieces of the Dark Ages—the bench, the chest and the bedstock—and transformed them into things of beauty. They made not only objects of beauty but, in comparison with earlier efforts, articles of real comfort and convenience. Their constructive work was built for centuries rather than for years, yet the delicacy and charm of their carving, now almost as perfect as when it left their hands, still stand as models for the world.

THE RENAISSANCE IN FURNITURE



With the sixteenth century came a transformation in living. The Renaissance ("new birth"), beginning in Italy, gradually spread throughout Europe. The house was no longer a stronghold; it had become a home.

Periods. The Renaissance had three distinct styles. The first was developed between the years 1300 and 1400, and its influence was confined to architecture and sculpture. This is known as *trecento.* The second, or *quatrocento* belonged to the fifteenth century, and was a more classic style than its predecessors. The *cinquecento* belonged to the sixteenth century, and was the culmination of the art of the Renaissance. The former styles were but a preparation for the architecture, sculpture, painting and decorative arts of the sixteenth century.

It was not until the *cinquecento* period that furniture showed traces of the classic revival. Woodworkers clung to Gothic designs long after stonecutters had discarded them. Thus some of the *trecento* and *quatrocento* motives are exhibited in the furniture of the sixteenth century. It is well, in studying the woodwork of this epoch, to keep in mind the leading features of the three styles. The *trecento* consisted of interlacing lines combined with simple tracery and conventionalized foliage. The *quatrocento* blended the festoon, the garland, the band, and the cartouche with

naturalistic fruit and flowers. The *cinquecento* was a restoration of classic details and included the fret, the arabesque, the anthemion, or honeysuckle, the scroll and the acanthus.

The Renaissance raised furniture making to an equality with the other industrial arts. Pupils were apprenticed to a master and studied with him until they had perfected their craft, after which they opened workshops of their own. The pieces produced in these great studios united beauty with utility.

Venerable Bede Chair

Chair of rough-hewn wood said to have been used by the Venerable Bede, English monk and ecclesiastical historian, born in Durham in the seventh century.

For the first time designs were made with reference to their setting. The furniture of the private dwelling was suggestive of neither cathedrals nor abbeys. It was made with a careful regard for the needs of the owner, his station and manner of living. Thus houses possessed a harmony which had hitherto been absent.

French Renaissance. The "new birth" in France may be divided into the following epochs: first, Transition, 1453-1515, including the reigns of Charles VIII and Louis XII; second, Francis I, 1515-1547; third, Henry II and Henry IV, 1547-1610; fourth, Louis XIII, 1610-1643. Under Charles VIII the great tide of the Renaissance extended northward.

Francis I and his Successors. The reign of Francis I was one of great activity in all lines of artistic achievement. This monarch, unwilling to be outdone by Henry VIII of England and Charles V of Germany, summoned to his court the greatest architects, painters, designers and woodcarvers of Italy and Flanders. Under his patronage were erected many beautiful buildings, which, in part at least, give some hint of what the French Renaissance accomplished.

France has had but one other such royal patron, Louis XIV. Both sovereigns were nearly equal in power. Francis had the advantage of coming to the throne at a more interesting period of the world's history. His reign, a little more than a quarter of a century in length (1515 to 1547), represented extraordinary achievement. The combined reigns of the five succeeding monarchs—Henry II, Francis II, Charles IX, Henry III and Henry IV—completed the century, and brought to a close the most important years of the French Renaissance. Of these sovereigns, so different in character—four of whom represented the many virtues and vices of the House of Valois—Henry II and Henry IV alone were worthy successors to the great Francis I. They exerted a helpful influence on the fine and industrial arts and left much to testify to their taste and generosity. Both have been immortalized in a "Style," the Henry II being the more celebrated.

Renaissance Details, at first were combined with Gothic construction. It was not until the sixteenth century was well under way that the real force of the Renaissance was felt. France was the birthplace of Gothic art and the transitional period was of longer duration than in Italy.

In the reign of Francis I, chairs became more varied in treatment. The cane design of Flanders was early adopted; the plain high Dutch chair became a favorite, but was somewhat reconstructed. The French seem at all times to have been very much concerned about comfort, far more so than the English who, until the seventeenth century, were more or less indifferent to many of the refinements of life. And it was then by way of France that many minor comforts reached England.

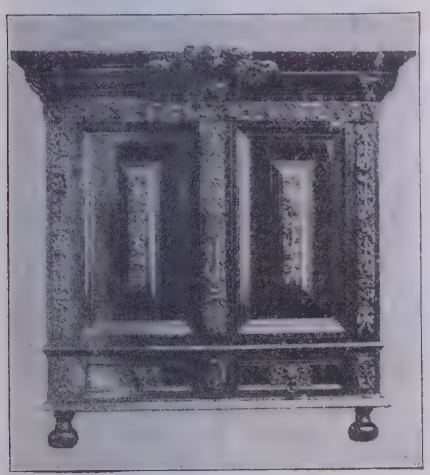
As the sixteenth century advanced, French cabinets developed on high and narrow lines. Those of the Francis I period show carved panels, moldings and pilasters, but seldom anything ponderous—although at this time presses and armoires were built on heavy models. Distinctions between these pieces of furniture were always made in France, where subtle dividing lines were recognized. French furniture makers also made a distinction between designs for the *salon famille*, or family rooms, and the *salon campagnie*, or rooms for more formal use, and this is the reason why so much French furniture which comes to this country is unfitted for our living rooms. It was never intended for anything but gala apartments and, naturally, looks out of place elsewhere.

Henry II in many ways did as much for France, artistically speaking, as did Francis I. He did not build in the lavish way of his father, but two very clever women ruled his court, and each in different ways had a tremendous influence on the arts of the day. One was Catherine de Medici, whose tastes were naturally Italian; the other, Diane de Poitiers, was easily the most remarkable woman of her time. Diane's emblem, the crescent, is found combined with Henry's monogram in one of the beautiful rooms in Fontainebleau. The chimney piece shows the early stages of the beautiful Renaissance pattern known as "strapwork" a carved pattern of interlaced lines, so popular with workers in stone, wood and silver in both France and England. It is seen in woodwork, in furniture, in the Grolier bookbindings, and in the Oiron pottery, also known as Henry II ware.

Between the reigns of Henry II and Henry IV (the latter better known as Henry of Navarre), no marked changes took place in handicraft. By the time the latter came to the throne, a good deal of the beauty of early Renaissance ornament had disappeared. The simple arabesques, seen to such charming advantage in the Francis I style, and the equally simple strapwork of the Henry II style, lost favor with decorators and woodcarvers. Shell ornament, which was destined to play such an important part in the decorative arts of France for nearly two centuries, came into great prominence during the Henry IV period, although known at an earlier date.

During the reign of Louis XIII came many changes in domestic comfort. The upholstered chair, in the modern meaning of the term, came into existence. It was an armchair, and the seat was lower and broader than that of previous periods; and the upholstery, instead of being any rich and sumptuous material which the designer of the chair could command or the owner

French Gothic Chair



happened to possess, was an especially selected covering so designed as to correspond with other chairs or to harmonize with the wall treatment. Window draperies were also selected with great care and were more than a mere protection against air and sunlight. The age of upholstery had arrived.

Wall treatment received especial attention and was carried to a very elaborate point in France during Louis XIII's reign. Simon Vouet, who bore the same relationship to

Louis XIII that his famous pupil, Le Brun, did to Louis XIV, was responsible for most of the florid decoration of the day. Furniture makers were always a little behind the decorators, and while many of the wall schemes of the day are too ornate from the modern viewpoint, at least the beautiful chairs, tables and cabinets are well worth studying. Flemish influence was strong in the early part of the seventeenth century, due indirectly, it is said, to Rubens' visit to the French Court.

Characteristics of the French Renaissance. There was a transitional period similar to that of Italy, but of longer duration; for Gothic art was more firmly rooted in France than in the south. The ornament of the French Renaissance was in a lighter vein than that of the Italian, and less dependent upon antique models. Delicate arabesques and pierced shields were used by furniture makers and decorators. Later in the sixteenth century woodcarvers combined an interlaced ribbon or strap ornament with the lozenge and the cartouche, and this was followed by the introduction of the shell and the ornate scroll. From that date woodcarving lost much of its charm.

Flemish and Dutch Renaissance. The Renaissance reached Flanders and Holland tardily. Gothic traditions lingered late in the north, and the long transitional period lasted well into the sixteenth century. Holland was always more independent politically than Flanders, and her work was less influenced by outside conditions. This fact makes Dutch work comparatively easy of identification, while that of the Flemish, being more mixed, sometimes raises a question. Spanish and French influences are more often present in the early Flemish work. Charles, King of Spain and Emperor of Germany, was also Count of Flanders and Duke of Burgundy. The intercourse between these countries and provinces grew decidedly intimate at this period. The Italian Renaissance had waned when the Flemish Renaissance was at its height.

Flemish Cabinet
Beautiful carved cabinet of the late seventeenth century. In the Bruyn Collection, Mechlin, Belgium.

Holland and Flanders were far enough away from Italy to be quite independent of her influence. When Italian influence reached Flanders it came by way of France, with a strong mixture of French feeling added. When this complex influence was carried into England it had gained another element in addition to the Franco-Italian, and this is one reason why the English Renaissance swings so far from the classic. In the sixteenth century, particularly, English work showed far more Flemish influence than either French or Italian. In the seventeenth century it was more Dutch than Flemish in feeling, and remained so until the pendulum swung once more toward French designs, this movement giving way to the classic revival of the late eighteenth century.

Flemish Carvings. Primarily the Flemings were great carvers. They had carved for centuries, and having carried Gothic ornament to a fine point, it was quite natural that they should continue to carve when a totally different style came into vogue. They were less bound by classic traditions than the Italians, and maintained a simpler mode of living. The Flemings, in their woodwork, have always used the human figure. Heads of men and women decorate many of their pieces, particularly in such articles as cabinets, cupboards and sideboards, and where there are large expanses of wood to be covered.

Paneling, ribbon bandeaux, garlands of fruit and flowers, strapwork and kindred things are more harmonious in a modern dining room or living room than masks, animal heads or the human figure, clever as they may be in execution. The linen fold pattern, sometimes called the "parchment scroll" is a survival of Gothic ornament. It is found in much of Flemish furniture of the sixteenth century and is one of the simplest and best patterns of that day.

Many Flemish ideas exist in our everyday furniture, but we have long since accepted them as entirely modern. They do not suggest to the casual observer anything bordering on period styles, and are only "period" through long years of transforming and adapting. Flemish furniture makers did much in promoting the evolution of the chair. For example, they rebuilt, as it were, the beautiful Gothic chair, lowering the seat as well as the back, and substituting horizontal braces for the heavily carved arched braces of the fifteenth century. Flemish chairs were of several varieties, but two types were prominent—the upholstered chair with turned legs and braces, and the carved chair with a cane back and a cane seat.

Dutch Furniture. The Dutch at this time were achieving fame in different lines. They were not a nation of carvers. They were great in a different way. Marquetry and inlay were favorite Dutch methods of ornamenting furniture during the seventeenth century. While "inlay" and "marquetry" are often confused, they are quite different in workmanship and appearance. Inlay is of ancient origin and is made by filling in a depression cut from the surface of the wood. The Italian word is *intarsia*, meaning "to insert." Marquetry is of later origin and is, in reality, an "overlay," best described as a thin veneer of different woods fitted together to form a pattern. The veneer, when applied to the surface of the cabinet or other piece of furniture, apparently becomes a part of the construction. In the hands of an expert, there is opportunity for varied and colorful effects with marquetry. Dutch craftsmen have achieved marked success in this field.

The special value of the Flemish and the Dutch Renaissance, from our viewpoint, is the effect it had on the furniture making of England; for by this time (late seventeenth century) we of America had our own furniture interests. If we date the Colonial Period from the time when it really began, 1620, our own era had come into existence; and though no one knew it, least of all ourselves, we were making furniture history.

Dutch Chair Showing Italian Influence
A seventeenth century chair with turned arms, legs and stretchers and carved finials. Private collection, Berlin. Courtesy Metropolitan Museum.

In summing up the contributions of Flanders and Holland to furniture making, special emphasis should be laid on the cane work of the former country and the marquetry of the latter. But Dutch marquetry, beautiful as it is, pertains to decoration rather than construction, and it is to Flemish designers that the greater glory belongs.

German and Spanish Renaissance. Two phases of the Renaissance, German and Spanish, terminate the great Classic Revival on the Continent. In Germany there was a long transitional period during which the lingering traditions of Gothic art died slowly. The early phases of the Renaissance show the grafting of the new upon the old. This mixture of Gothic and Renaissance was less successful in that country than in France, where a happier union prevailed.

The best examples of German woodcarving of the early sixteenth century were of ecclesiastical origin. Choir stalls and altar pieces were richly decorated in the manner of the day. In domestic furniture, the combination of Gothic construction and Renaissance ornament was less harmonious.

The great presses and cabinets are the most characteristic pieces. Made of oak and walnut with carved panels and heavy doors, they are as substantial today as when they came from

the hands of their maker. The cabinet shown has an unusually fine scheme of decoration. The plain surfaces are well distributed and the ornament, although elaborate, is neither heavy nor fantastic. The lock is concealed in the carving, while the key repeats the lines of the ornament. The ball feet are worthy of note, as they indicate a new feature of furniture making.

From her oriental colonies, Spain imported ebony and ivory and other costly adjuncts to furniture making. The elaborate metal work, which today is the most interesting part of a great deal of this furniture, is Spain's most important addition to furniture designing.

The Moors. Damascening, niello-work (the inlaying of metals) and kindred crafts had long belonged to Spain, following closely on the Moorish invasion. In Granada, the city of the Moors, were fashioned many of the

Wainscot Chair of Elizabethan Design
Furniture of the Elizabethan period had a sturdy appearance. Chairs had flat seats and the style was rich and impressive.

most elaborate chests and coffers, and long after the Moorish expulsion, Granada still remained the center of fine cabinet work. Those who visit the Alhambra today can trace many similarities between the wall decorations of this famous palace and the embellishments of old Spanish furniture. The Gate of Justice and the Gate of Judgment recall in a grander, bigger way certain motives in inlay and metal relief, and the whole architectural and decorative scheme brings to mind the comparison that it is all a grandiose kind of jewelry.

The cabinet, elevated on high-turned or carved columns, was a characteristic piece; and as one or more examples are usually found in every museum and in many private collections, it is as typical a specimen as could be selected. One type is quite plain, apparently, but the whole front lowers at the turn of a key and reveals an exquisite inlay of ivory and metals with ornamental bosses. And there are many variations of this beautiful style. Iron is used most attractively at times, and the inlay includes bone, horn, shell, and occasionally painted decorations. In the city of Vargua these colorful pieces were made.

The influence of the Flemish cane chair on the furniture makers of Europe has been mentioned. The leather chair of Spain equaled it in importance. Both had high backs and carved legs and braces, but there the resemblance ended. The Spanish design consisted of a sturdy frame of oak, chestnut or walnut, a back completely encased in leather, turned stretchers, a carved underbrace and hoof feet. English furniture makers of the seventeenth century gained inspiration from both Flemish and Spanish models in their famous Jacobean designs of wood and cane.

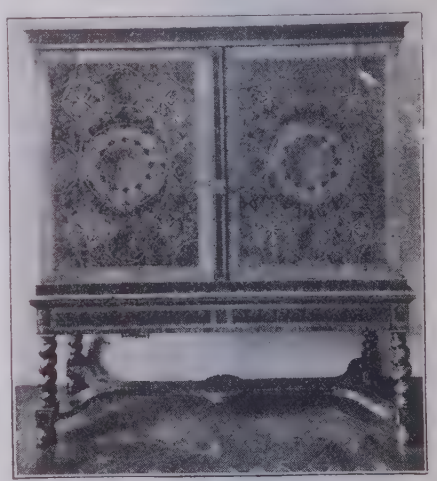
The English Renaissance. By the middle of the seventeenth century, French and Italian furniture, like the wall treatments of that day, became heavy and ornate. The vitality of the Renaissance in these countries had ended. It was the age of beautiful surfaces and of elaborate ornamentation. Constructively, neither the Italian nor the French had as much to their credit as in the previous century. Craftsmen were painting the lily and gilding refined gold.

English craftsmen never interpreted the Renaissance as did furniture makers of the continent. When the classic wave reached England, it had gained and lost much on the way. There were French and Flemish influences, and English traditions too firmly planted to be uprooted.

Historic Periods. The characteristics of the sixteenth and seventeenth centuries in English designing may be summarized briefly:

First, the English Renaissance, or Tudor, which was a mingling of Flemish and Italian grafted upon Gothic; second, late Tudor or Elizabethan, showing greater unity (strapwork and paneling were features of this period); third, Jacobean, covering nearly a century, and including many types. Furniture was paneled and carved until the introduction of walnut, when veneer and marquetry became popular. Among Jacobean characteristics were the spiral leg, the rising panel and spindle ornaments. With the accession of William of Orange in 1688, Dutch influence prevailed, and English furniture was slowly developed on more graceful lines.

English Renaissance, Tudor, late Tudor or Elizabethan and Jacobean, are terms associated with the sixteenth and seventeenth centuries—a long period to sum up in a sentence, but one which, in spite of "mixed motives," was remarkably homogeneous.



Queen Elizabeth was, of course, very much a Tudor, but having been honored by a style all her own, the term "Tudor" is usually applied to the reigns of Henry VII, Henry VIII and Mary.

Henry VII's reign, beginning in 1485, was contemporaneous with the reigns of Charles VIII and Louis XII. Elizabeth's long term ended in 1603 while Henry of Navarre was on the French throne. The early and late Tudor periods thus covered 118 years, the Virgin Queen (Elizabeth) appropriating nearly fifty. In company with Victoria, she is quite entitled to her own "style."

The Henry II period is very closely allied to the Elizabethan, because of the strapwork motive in wood carving which was popular in Flanders, England and France. Strapwork is seen in many English cupboards of the late sixteenth century and also in chimney breasts and wall treatments. It is one of the most valuable contributions to design of the Elizabethan period, and ranks with the linen fold motive of an earlier day, and with the "rising panel" of a later one.

Styles in English furniture were of slow growth, with much overlapping and intermingling. The Jacobean period was well under way before many changes in design took place, and it was not until Charles I ascended the throne that the popularity of certain Elizabethan patterns waned. Even then the outlines of furniture changed little. The court and livery cupboards were modified to suit a simpler scheme of carving; but oak was still the chief wood, and so long as it remained in use, massive furniture continued to be made. The Protectorate caused a break in the crafts, and by the time it was over and Charles II safely placed on the throne (1660), many new influences shaped and developed English handiwork.

Jacobean furniture is roughly divided into two parts—"Early" and "Late." Early

Mosaic Cabinet
Choice example of marquetry work in English furniture of the seventeenth century.

Jacobean preceded the Commonwealth, covering the reigns of James I and Charles I. Late Jacobean followed the Commonwealth, including the reigns of Charles II and James II. The Commonwealth, or Protectorate, with Oliver Cromwell at its head, was too turbulent to be very productive of the arts.

After the Restoration, all English furniture became more graceful. Charles II had been brought up at the court of Louis XIV, and quite naturally returned to England with French ideas of comfort and refinement.

The furniture of Charles II's time is worthy of its present revival. Designers retained the best of the many motives bequeathed from the earlier part of the century, and combined

them with newer schemes. Paneling remained in favor, but was diversified by nailhead and spindle ornaments.

The introduction of walnut brought about a decided change in English furniture. It made possible a lighter, more graceful construction, and an entirely different scheme of decoration. Carving was largely superseded by marquetry, which was well adapted to walnut and to the Dutch designs which William introduced.

Metcalf Bowler House

Late seventeenth and early eighteenth century furniture against a paneled background. From the Metcalf Bowler house, Portsmouth, Rhode Island. American Wing of the Metropolitan Museum.

The William and Mary period is a brief but important link between seventeenth-century oak and eighteenth-century mahogany. During this period the revocation of the Edict of Nantes caused many Huguenots to take refuge in England. A large portion were of the craftsman class, and readily found employment. This added another and very refined element in furniture designing.

Walnut was used during Queen Anne's time, and continued in favor until mahogany was well established between 1720 and 1730. The cabriole, or curved, leg is credited to the reign of William and Mary, and a most valuable accessory it proved to be. Inasmuch as William and Mary ruled jointly, (a share-and-share-alike plan unique in English history), their brief period has an additional claim to consideration.

THE EIGHTEENTH CENTURY

French—Louis XIV, Louis XV, Louis XVI. When Madame de Maintenon wrote to a friend, "The King will have us buried in symmetry," she expressed characteristic features of the Louis XIV style. It was symmetrical, balanced, beautifully proportioned, cold, formal, lacking in imagination and, from modern viewpoints, oppressively grand—like the monarch for whom it was named. Thirty years ago there were probably fifty rooms in this country furnished in Louis XV, to one furnished in Louis XIV. The latter had not been popularized by the professional decorator. It belonged to that remote century, the seventeenth, which for some strange reason has always seemed several hundred years away from the eighteenth.

Characteristics of Styles. French styles may be briefly characterized as follows:

Louis XIV was a formal rococo in which proportion and balance were the chief features. Important details were the shell, the classic acanthus, the ram's head, the mask and the satyr. In the early period, furniture was massive, and the designs of the Louis XIII style were perpetuated. Carving was largely displaced by marquetry and by chiseled mounts of metal. Boulle furniture belongs to this reign, and is among the most valuable of the period. André Charles Boulle was a talented man; but his fame rests chiefly on a unique marquetry of tortoise shell and brass with which he ornamented furniture. Brilliant effects were obtained by lining the shell with color, and by the addition of ormulu mounts. Ormulu was a mixture of mercury and copper which, when added to the metal brass, gave the tone and texture of gold. Much French furniture of the time was thus embellished.

The period of French designing known as the Regency was the work of that brief time between the death of Louis XIV and the coming of age of Louis XV, when the Duke of Orleans was Regent. The Regency forms an important link between the Louis XIV style and that of the real Louis XV. It is, however, extremely ornate, and least worthy of admiration of any of the French periods.

In the Louis XV period, balance and symmetry were less important in the eyes of the furniture makers than were richness of ornament and flawless execution. Angles gave way to curves, and the talents of the goldsmith and the painter were employed in designing furniture which, in point of workmanship, has never been surpassed.

In the time of Louis XVI, simplicity of construction and severity of ornament were dominant. Rococo details disappeared, and classic emblems replaced them. Important features were the fluted column, the bay leaf, the oak and the acorn, the bell flower or "corn husk," the Greek band and the acanthus. Straight lines took the place of curves, and ornament was a means instead of an end.

The long reign of Louis XIV witnessed many changes and developments in furniture designing. The reign of the next Louis was briefer, but quite long enough to make any one phase impossible; however, with the final Louis—if we leave out Louis XVIII, whose importance is slight so far as "periods" in furniture are concerned—the designing of the eighteenth century seems to have been crystallized. All the furniture of these three great epochs shows marvelous execution. Whether it be a Louis XIV cabinet, a Louis XV chair or a Louis XVI table, the workmanship is unsurpassed.

Metal played a very important part in many of the designs and added tremendously to their cost. Furniture decorated with insets of porcelain, usually of Sèvres, formed one class of furniture; and fine upholstery of Beauvais and Aubusson were important accessories in both Louis XV and Louis XVI designing.

Armchair of the Early Eighteenth Century

An armchair of the early eighteenth century showing the curved leg called the "cabriole" or "bandy," and, in this instance, having the flat or web foot.

English. *The Early Eighteenth Century.* In our devotion to English furniture of the late eighteenth century we are apt to overlook the rich legacy bequeathed to us by the early eighteenth, or to confuse it with other periods. Yet the first half of this fascinating century was almost as important—a period of great variety of design, of many men working in many veins, of old ideas slowly giving way to new. If less unified than the latter half, it was nevertheless full of picturesque vigor and of sturdy simplicity—partly Dutch and

partly a survival of Jacobean traditions which lingered in spite of changed conditions.

The perpetuation of Dutch motives—such as the cabriole leg and the web foot continued until the fourth decade of the century. The web foot or flat foot we find in most of the furniture of Queen Anne's time, and a charming adjunct it is to the designing of the day. Chippendale preferred the ball-and-claw foot which he used with distinction. He was one of the first English furniture makers to use the square leg, and one of the first to adopt the curving French leg of the Louis XV period; but he clung to the cabriole, or bandy leg, in its various forms until about 1740.

Chippendale was the first English furniture maker to have his name perpetuated by a style. Celebrated designers had preceded

Chippendale Chair

Chippendale chair showing cabriole leg, shell knee, pierced splat and ball-and-claw foot.

him, but their identity is submerged in that of their sovereign. Chippendale raised his craft to such a point of excellence that his own name became associated with it.

What furniture of the eighteenth century would have been if mahogany had been unknown, is a difficult question to answer. It is impossible to imagine Chippendale's designs in oak, just as it is impossible to conceive the heavy furniture of the seventeenth century executed in mahogany.

The chairs and settees from the Chippendale shop in Martin's Lane comprised many different styles. Among them were the early Dutch types with ball-and-claw feet and plain splats and these same Dutch types with pierced splats. These two distinct backs were also combined with straight legs, and later there were other variations. The curved leg of the Louis XV style was a favorite with Chippendale, but was usually combined with an elaborate back. There were several distinct "ribbon" styles, a rather uncommon one having an intricate leaf pattern carved with the ribbons. After 1740 the "Gothic manner" and the "Chinese taste" fascinated Chippendale, and about 1750 he became extremely rococo. The English designer is not at his best in copying the Frenchman, and Chippendale pleases us least in his rococo furniture; nor do we like him nearly so well in his Gothic and Chinese absurdities as in his earlier and simpler pieces.

Chippendale's great point of excellence was his ability to take the designs he found at hand and so improve them that they took on new life and meaning. He was a past master at adapting; in other words, he was much less of an originator and much more of a free and most successful translator of all that came to his hand. That he had more than his just reward is perhaps true. That he did not make or even design half the furniture bearing his name must also be conceded. But that he gave permanent fame to much that would have perished but for his indefatigable efforts must always be placed to the credit of "T. Chippendale of St. Martin's Lane."

The Late Eighteenth Century. Thomas Sheraton, Thomas Shearer, George Hepplewhite and Robert Adam are the names which stand out brightest in the roster of the late eighteenth century. Possibly Robert Adam should come first, and Shearer, fourth. Transpose them as you will, but place Sheraton near the top. It might be well to mark both Adam and Sheraton "one," for it is hard to divide the honors.

Adam Furniture. Robert Adam, fresh from his studies in Italy, returned to England at an opportune time. With him came Bartollozi, the engraver, and the painters, Pergolesi and Cipriani—both destined to play an important part in English furniture making.

We recognize the urn and the oval rosette as Adam; and we recognize certain motives like the acanthus, the ribbon band, the arabesque and the garland as both Adam and Louis XVI. There is a good deal of similarity between the two styles. We find in the English style a greater slenderness and a totally different treatment of the wood. The Adam Brothers used carving very sparingly; many of their finest pieces have not a trace of it. They also brought to perfection painted furniture, employing Pergolesi, Cipriani and Angelica Kauffman for the finer work.

In Adam furniture a charming light green is often seen; there is also a burnished gold which almost equals Vernis-Martin, the celebrated varnish invented by the Martin family of France. Cipriani had many Italian secrets of mixing colors, and a good deal of this work is from his hand.

Cane Furniture was designed by Adam and is today the type most frequently reproduced by American furniture makers. The chair back is usually oval, and the cane webbing follows the lines of the frame. The round leg, instead of the square, was preferred by Adam. Hepplewhite chose the square leg instead of the round; Shearer did likewise. Sheraton used both the plain round leg and the square leg; he also had a marked liking for the fluted leg of the Louis XVI style. In most of the Sheraton furniture in this country, the fluted leg is found. In the sideboards especially, it is a characteristic feature.

Inlaid Work. By the last decade of the century, the fancy was no longer for mahogany of any kind. Inlaid furniture of satinwood and painted furniture of satinwood represented the taste of the hour. Many writers have credited to Sheraton the introduction of satinwood. If this be true, he gave almost as much to the Adam Brothers as they gave to him.

Sheraton. Sheraton's furniture creations may be divided into three classes—carved, inlaid and painted. His sideboards and chairs come usually under the first head; his cabinets and tables (the latter found in great variety in England) to the second; and to the third belongs a large portion of the work he did for the Adam Brothers, which is extremely scarce in this country. Some of his inlay has as much color as if executed with the brush.

Hepplewhite. Hepplewhite's greatest characteristic was his masterly use of heart and shield-shaped motives. Most of his chairs have shield backs, but it was in his dressing tables and kindred articles that this motive is seen in its most charming guise. Charm is truly the word to give to his work. The strength of Chippendale or the proportions of Sheraton we do not find. His range is limited; he repeats one theme over and over. His knowledge of woods did not equal Sheraton's, nor had he any of Chippendale's mastery of

Hepplewhite Chair

Hepplewhite chair showing shield back and square tapering legs.

construction. But he had a fine intuitive feeling for beauty, and he expressed it in his work. He was not a carver of note, like Chippendale, nor a master inlayer like Sheraton; yet so great was his popularity that he employed many men to help him fill his orders. His reputation was so well established that after his death in 1775 his widow successfully carried on his business for years.

Neither Sheraton nor Hepplewhite could rob Chippendale of his supremacy as a chair maker. Sheraton's designs with straight legs and rectangular backs are not his most at-

tractive work. In Hepplewhite's chairs, his famous shield seems to lack constructive force. Chippendale still held his field. Sheraton's sideboards, cabinets, tables and bedsteads are very commendable. Hepplewhite's sideboards and tables are also greatly to his credit. To Sheraton we accord a grasp of proportion and a feeling for restraint which were not equaled in his generation. If we place him at the head of the furniture makers of his century it is because he expresses the ideals of our own day—simplicity, proportion and reserve. Chippendale produced a far greater variety of designs, not alone because variety of design appealed to him, but because he lived at a time when fashions in furniture were extremely diversified. The last quarter of the eighteenth century was a remarkably unified period, and here tribute must again be paid Robert Adam for being largely responsible for producing it.

Thomas Shearer must be mentioned as a designer of distinction—particularly successful with sideboards and bookcases. The serpentine sideboard is supposed to have been originated by him. Hepplewhite gave this type a lasting value, and it is his name that we associate with it.

The French Empire. The Empire style marked the last of the great historic periods in furniture and decoration. It was cold and formal, reflecting the personality of Napoleon, the man so closely identified with it. The Revolution brought chaos to the industries of France which had flourished under the old regime. Cabinetmakers and metalworkers were thrown out of employment. Many suffered imprisonment or death by the guillotine. With few exceptions the artist-artisans of the Louis XVI period had little part in the handicraft of the Empire. The Directory and the Consulate were periods of construction. In the arts, the process of rebuilding is slow. David's name is associated with this transition from old forms to the new, and with him must be mentioned Charles Percier and Pierre Fontaine. Percier was architect to Napoleon during the Consulate, and ranks with Fontaine as a celebrated craftsman of the period. Napoleon was not a patron of the arts, yet no monarch of the old regime had so dominated a style. The letter "N" is stamped over the entire decorative scheme of the Empire.

Designers of Louis XVI's day lauded the classic, but seldom to the extent of the Empire artists, and never to the glory of one man. The laurel leaves of the preceding style were rearranged and twisted into a victor's wreath. The fluted column upheld a torch. Roman and Grecian emblems were used lavishly. "Paris was to become a new Athens, Napoleon a Caesar, and France a second Roman empire." The craze for the antique transformed the dress of the day. Statesmen wore togas, and court ladies donned the gowns of Greek goddesses. Architects, decorators and furniture makers were imbued with the spirit of the hour. The classic lived again and, if somewhat inconsistent, the enthusiasm of the day overlooked all shortcomings.

The chief characteristics of the Empire style were the wreath, the torch, the Roman eagle, the Athenian bees, the Greek fret and the honeysuckle. After the campaign in Egypt the sphinx was added to the medley, and became a conspicuous feature in both furniture and decoration. Distinctive qualities of the furniture of the period are few and easily mastered. Constructively, the plain column and the claw-foot are the most salient features; decoratively, the wreath and torch are most prominent. Marquetry was discarded, and plain surfaces were covered with ornamental mounts of chiseled metal. Chairs showed a square frame with a plain round leg, ornamented with mounts of characteristic patterns.

In the plainer form, the Empire style was full of dignity. If it lacked the charm of the graceful Louis XVI style it had, on the other hand, qualities of repose and stability which placed it far above some of its predecessors. One of the most interesting phases was the strong influence it exerted upon American furniture making of the early nineteenth century.

The term Colonial, used in its literal sense, includes the household effects of the colonists from the time of the settlement at Jamestown until the war of the Revolution. This restricted definition excludes the work of the great English cabinet makers of the late eighteenth century, and similarly excludes all pieces which owe their origin to the style known as the Empire. Thus the furniture of Sheraton and Hepplewhite, together with those massive mahogany shapes having carved columns and claw-feet which have long been the stronghold of colonial connections, are debarred from this category. Correctly speaking, these pieces should be classed as late Georgian and American Empire. To limit the adjective "Colonial" to the furniture imported or made by the colonists prior to 1776 would disqualify more than half of the furniture in this country. The word has been used so long in a wider sense, and has been applied so continually to everything in furniture from the earliest possessions of the Pilgrims to the designs in vogue as late as 1820, that it is doubtful if the literal meaning is ever accepted. From one point of view the broader use of the term is the right one. It was not until 1830 that American furniture makers ceased to be governed by the standards of the Old World. English taste in house furnishing prevailed long after English supremacy was at an end. The Colonial period in furniture outlived the Colonial period in history by fifty years.

In the accepted definition, two centuries of furniture making are covered—1620-1820. The first hundred years may be called the age of oak, the second, the age of mahogany. During the earlier period, the history of all handicraft in this country was closely allied to that of England and Holland. In the later

AMERICAN FURNITURE

Early American. After pioneer days the colonists modeled their homes on those of their native land. Heavy oak of the old country provided the first furniture, but pine and hickory pieces made in the colonies soon followed. Toward the end of the seventeenth century, the transition from massive to more graceful forms took place. The introduction of mahogany in England rapidly influenced furniture making on this side of the water, and for fifty years Chippendale, Hepplewhite and Sheraton were the guiding stars of American designers. Early in the nineteenth century English patterns declined in favor, and French influence became paramount. The Empire style marked the end of Colonial furniture making.

epoch Dutch influence lessened, and England shared with France the molding of taste in America.

American Empire. After the War of 1812 English models lost their prestige and furniture makers turned to France for inspiration. The American development of the Empire style is a lasting credit to the designers of this country, and forms a fitting close to the second century of Colonial furniture making.

While the Empire style in America followed in a general way the trend of the movement

American Highboy

in France, it was free from the incongruities which marred many of the foreign pieces. Carved columns, claw-feet, pineapple finials and ornamental brasses were the hall marks of the American Empire. Realistic heads of lions and griffins and many Egyptian details to which the French furniture makers resorted were happily absent from the work of the Americans.

Survival of the Fittest. In the past there has been a survival of the fittest in furniture. The transitional Gothic and traditional Renaissance pieces are not nearly so numerous as are pure specimens; and so it is with Elizabethan furniture, with Charles II pieces, with Queen Anne designs, with examples of Chippendale and his contemporaries. The experimental pieces—which might be called the failures—have apparently disappeared. Modern furniture makers have rendered marked assistance in reproducing the best—the most typical specimens—and thus perpetuating the good.

Reproductions are usually more successful than adaptations; faithful copies, than free translations. This is particularly true of mahogany designs. The oak furniture of the seventeenth century may sometimes be more freely interpreted if there be skill of hand and taste and discrimination back of the skill. But with the furniture of the succeeding century, he is wisest and most successful who does not alter the line, but reproduces truthfully.

Nineteenth Century Designers. Duncan Phyfe, of Scotch birth but of New York residence, takes high rank among furniture makers on this side of the Atlantic. He drew his inspiration from later Sheraton types, but infused much individuality into everything he touched. He gave lightness and charm to tables and chairs at a time when most of his contemporaries were working on heavy Empire models. It is said that his name was originally Fife; but, not wishing to be confused with another and less gifted designer, he adopted a different spelling. Time has evidently obliterated the other man, for today there is but one Phyfe.

Another New York designer, John Belter, achieved much success about 1850 with rosewood furniture which he constructed on elaborately carved lines to meet the taste of the day. Genuine Belter pieces had a brief revival a few years ago but were too ornate to endure. Following the vogue for rosewood came black walnut, and with it the twilight of furniture making. Ponderous tables upheld marble slabs, black horsehair formed the upholstery of chairs and sofas, and the art impulse of the moment expressed itself in Rogers groups, china dogs and chromos. A little later the golden oak sponsored by Eastlake in England found favor in this country, retaining its popularity long after it had been discarded across the water.

When William Morris—with a sounder philosophy and a truer art—succeeded Eastlake, a return to simpler forms gradually took place. Undoubtedly the Morris chair had a part in the development of the Mission style. Mission furniture, heavy and clumsy as it often was, by its very severity and directness brought about a necessary leaven of simplicity. Straight lines and plain surfaces replaced the jig saw carving and pressed ornament of golden oak.

Early Twentieth Century. A revival of Colonial architecture and furniture marked the opening of the twentieth century, followed by a keen quest for Old English. In rapid sequence, Italian, Early American and Spanish styles have dominated the collector, the decorator and the maker of reproductions. The vogue for Italian and Spanish furniture grew out of the rise in popular favor of the Italian and the Spanish house as adapted by our architects. The demand for Early American furniture stimulated interest in many long-neglected woods, notably pine and curly maple. Rush chairs, ladder-backs and the various types of Windsors replaced, for the time being, the more familiar models of mahogany. Old painted furniture was included in this American renaissance, with a profitable study of actual craftsmen.

The present demand for old furniture has turned to the work of an American group growing yearly in prominence. Mahogany was the usual medium of these gifted men who now rank almost as high as the great English cabinet makers of the eighteenth century. Among the number may be mentioned Goddard, Savery, Gillingham, Gostelow and Randolph. The block-front desks of John Goddard of Newport, Rhode Island, and the lowboys of William Savery, of Philadelphia justly merit fame. The list of American designers is being extended in proportion as research brings to light data bearing on the lives and work of local craftsmen. Much cabinet work long attributed to English sources is now being reclassified.

Modern Furniture. What shall we place in our homes today when we have such a storehouse of riches from which to choose? Shall we turn back to period styles or express ourselves in new forms? Whether or not we are in full sympathy with the movement termed *Art Moderne*, we cannot ignore it. If we look beneath the surface, we see a sincere striving on the part of many craftsmen to express the life of today as truly as the great designers of the past strove to interpret the life of their generation.

Extreme advocates of the new furniture claim that the old traditional forms no longer meet the requirements of modern existence; that inasmuch as we live in a machine age, an age of new methods of transportation, of new means of communication, of new trends of thought, there must be new conceptions to meet changed conditions. To these enthusiasts the old order has passed. More conservative minds welcome the best of the modern cult, but hold fast to old and tested forms.

Twentieth Century American

Dining table in white lacquer with mirror top. The chairs are covered with white leather. P. T. Frankl, designer.

Not all of the new movement is as modern as its name implies. Many of the furniture motives hark back to very early times. Inspiration has been drawn from the tombs of the Egyptian kings, from ancient Aztec drawings and from other obscure sources. In fact, a fascinating study is presented to students wishing to fathom the impetus of the present day designers who quite rightly call themselves "Twentieth Century Primitives."

Just what verdict the future will place on modern decorative art remains for later historians to chronicle. If optimistic prophets may be believed, it will rank as the great period style of the first half of the twentieth century, taking its place with the traditional movements of the past.

INTERIOR DECORATION

INTERIOR decoration is the art of making our homes livable and beautiful. Whether the problem be mansion or cottage, a knowledge of certain fundamentals will be found necessary. Natural taste reënforced by study will enable a person of moderate means to accomplish more than the possessor of wealth unaided by these essentials, although no claim is made that houses can be furnished without an adequate expenditure.

Form, color and texture are an inseparable trio in the arts, and are invariably connected with every phase of interior decoration. A feeling for color is usually stronger than for form, although a highly developed color sense is rare.

IMPORTANT PRINCIPLES IN INTERIOR DECORATION

Five principles which the decorator will find as vital to success as does the artist are proportion, balance, rhythm, emphasis and harmony. Scale, order and unity also belong to the decorator's dictionary, as do simplicity, charm and individuality. The latter two are difficult to define in people and even more so in houses; but proportion and scale may be reduced to mathematical exactness. Many writers have defined proportion—some with clearness, others with such intricate phrasing as to be of little service to the amateur.

Proportion. The Greeks were masters of the subtleties of proportion, and a study of Grecian architecture is recommended to those who wish to go into the fine points of the subject. The decorator must understand this principle in so far as it involves the selecting and grouping of objects in relation to their background and to each other.

If the architect has done his work faithfully it will not be necessary to struggle with problems of proportion so far as the structural part of rooms is concerned. Faulty dimensions may sometimes be minimized by skillful decorative treatment, although it should not be the mission of decoration to correct architectural blunders.

Balance is that principle by which repose is attained. There are two kinds of balance—bisymmetric and occult. Bisymmetric balance is formal, full of dignity and produces a feeling of complete rest. The Colonial mantel with its perfectly matched pairs is a good example of bisymmetric arrangement. A line drawn through the center of the mantel would show two identical halves.

Occult, or hidden, balance produces a feeling of equilibrium, but is attained by more subtle means. The two halves of a mantel, side wall or whatever the composition in question may be, are not identical, but suggest repose by skillful arrangement. Occult balance is more imaginative than bisymmetric, and infinitely more difficult. The Japanese are masters of occult balance. Interesting arrangements in this type are often seen in studios. Artists naturally devote much time and thought to pleasing compositions. Still life, as grouped for a canvas, often exhibits this principle in a convincing and charming manner. The decorator brings a different viewpoint to bear on the subject; he is less concerned with composition as composition and more as to the general effect—not merely of one room taken independently, but of the house as a whole.

Rhythm is movement, or that attribute by which the eye is carried from one point to another. When correctly interpreted, movement is graceful, melodious and satisfying; when incorrectly expressed, restless and irritating. Books and pictures are among the objects which may be made rhythmic or discordant according to their arrangement. This principle of movement is very closely connected with that of order, which in this case does not mean the housekeeper's order. A room may be in order from the housekeeper's standpoint, and yet violate order in the decorator's meaning of the term. When the two orders go hand in hand, much has been secured. This combination means a spotless room, and expresses, in addition, balance, repose and serenity.

Emphasis. In emphasis we have a principle not difficult to understand. Every picture, every room, needs some point of interest to hold the attention. Too many points of emphasis end in confusion, a result almost as unfortunate as a complete lack of interest.

Scale is one of the most important words in the decorator's vocabulary. It might be defined as "relative size." When furniture too large in dimensions has been chosen for a small space, we say it is out of scale. The same is true of small pieces placed in a large area. Scale and proportion are closely allied. Sometimes the word "proportion" is used for the architectural features of a room, and "scale," for the decorative. As with other terms, the meaning becomes clear with the working out of actual problems. An hour spent in arranging objects on a mantel will be found more helpful than pages devoted to a discussion of bisymmetric and occult balances. In the same way the placing and grouping of furniture against different backgrounds will be found the surest way to understand scale. Invariably when a mammoth tree or rock is photographed, the photographer will ask somebody to stand in the foreground. He knows that in so doing the actual height of the object will at once be realized. The tree or rock might be much more impressive without the person, but it would not seem so large. Here is the matter of scale convincingly demonstrated—relative size.

Harmony and Unity are less easily defined. They are more flexible and consequently less tangible. No one thing in a room produces harmony. Harmony is attained by the successful blending or combining of many things. Unity is secured when the various attributes mentioned have been adequately handled. And it may be added that beauty need not be sought. Its presence will be felt immediately. Sometimes a room failing in some of these aspects will have individuality and charm. Sometimes a room apparently quite faultless will be lacking these qualities. It is precisely because interior decoration is not an exact science that it is so fascinating. The human element is always present.

Bisymmetric Balance

Interesting example of a mantel arrangement at "Oriel," Baltimore, Maryland. Any treatment but a formal one would be out of harmony with the stately setting. In the American Wing of the Metropolitan Museum.

COLOR IN INTERIOR DECORATION

The old discussion as to which is of greater importance, color or form, is seldom heard today. It has been the subject of endless controversies in the past. Sir Joshua Reynolds and Thomas Gainsborough, the renowned English painters, argued the matter over and over. Reynolds contended that form was greater; Gainsborough, that color should have first place. George Romney overheard the conversation one day—Romney not so fine a draftsman as Sir Joshua, not so

subtle a colorist as Gainsborough, but a painter of rare charm. Said Romney, "Why separate form and color? Why not unite them? Is not line merely where one color ends and another begins?" Wise Romney!

Reynolds and Gainsborough had a discussion which ended their friendship. Reynolds contended that a composition could not be painted successfully where blue predominated; Gainsborough, that it could. Reynolds declared that England could not produce the man. Then Gainsborough painted "The Blue Boy"—and Sir Joshua took to his bed. When Romney heard of the circumstance he is said to have murmured, "Plainly a case of the blues!"

Color in History. Color is a powerful agent in the hands of the decorator. Health and happiness, as well as beauty, are closely allied with it. Just as certain temperaments

Louis XVI Room
Showing mantel. Metropolitan Museum.

respond to certain musical harmonies, so it is with melodies of color. Highly sensitive persons are distressed by discords, sometimes positively harmed by them.

But before discussing color theories, the historical side of the subject should be briefly surveyed. The artist and the scientist have their particular angles, while the historian concerned with facts, brings another viewpoint to bear.

As with many matters relating to the arts, Egypt is our earliest source of information. Unshaded color in combinations of three tones, as red, yellow and black; blue, white and yellow; black, yellow and white are found over and over again in Egyptian adornment. Assyrian decorations show a stronger use of red, while early Persian schemes are dominated by blue. These three nations, Egypt, Assyria and Persia, form the preface to the great history of the industrial arts. Persian blue has endured until today and may be found in many forms. Rugs, pottery, enamels and illuminations show this beautiful color which is approached by Italian blue, but not surpassed by it.

We associate form with the Greeks and rightly so, but we should also pay tribute to their highly developed color sense. It is said that the Greeks were the first to use shaded color and to make liberal use of green and purple. Certain it is that at an early date they were familiar with Tyrian purple, that superb color which took its name from the ancient city of Tyre. Shellfish from the Aegean Sea yielded the dye for this famous hue which, centuries later, was to be known as "lost Tyrian." The Aegean Sea still abounds in shellfish, but this matchless color is made no more. Tyrian purple became the property of the Roman Emperors, a fact that gave rise to the term "Royal Purple."

Roman color schemes reflected Roman civilization. In the excavated rooms of Pompeii and Herculaneum, wall panels have been found painted in orange, black and white, and in that deep red we call "Pompeian"—a color akin to the once popular "terra cotta."

When the seat of the Roman government was transferred from Rome to Byzantium by the Emperor Constantine, and the name of the city changed to Constantinople, the art of the East began to filter westward. This influence, known as Byzantine, is mentioned at greater length in the article on "Furniture." Byzantine decoration was richly colored and often combined with gold.

Following this era, the fifth century, came a long period in which color played a small part. The Dark Ages were somber in contrast with the brilliancy of earlier centuries. With the long Gothic period, color came again into its own, but in a quieter form if comparison be made with Persian, Roman and Byzantine schemes, or with the sumptuous colors of the Renaissance. Famous are Gothic blues and greens which we find at their best in the tapestries of that day. Our large museums contain fine specimens which may be studied with advantage. Combined with the blues and greens are tans, soft yellow and delicate pink. Quite unlike these subdued tones are the warmth and richness of Renaissance colors—Venetian red, Florentine blue, Neapolitan yellow, and a wide range of greens and purples. There were brilliancy and subtlety, depth and delicacy, to Renaissance color schemes. It was an age of beautiful textiles used in a most regal way. We know from portraits how colorful were the costumes; we know that the medieval dwelling, with its perpetual twilight, gave place to the Renaissance house with its more homelike livable interiors. The study of color from this point leads to many countries, forming a fascinating theme. Within the scope of this article it is possible to indicate only a few of its phases. The student is urged to follow the subject first on English soil with the Tudor century (the sixteenth) and with the Jacobean century (the seventeenth), and to make comparison with contemporary periods in France. It will be noted that English color schemes are cooler and more conservative than those of France, yet admirably suiting paneled oak and sturdy oak furniture.

It will be seen that French interiors were more elaborate. Gold was used both in wall decorations and in furniture. Color schemes were more brilliant. With the eighteenth century, both in England and France, new elements will be traced. Backgrounds changed greatly in England; walls paneled in oak gave place to painted walls; furniture of oak and walnut was superseded gradually by mahogany. Costumes assumed a lighter, more graceful, aspect, and manners conformed to a different standard. Color schemes showed less vigor and more refinement. Backgrounds became fitting settings for powdered hair, lace and brocade. The connection between background and foreground has been close in all historic periods. The similarity that costumes bear to both, might be cited. Many parallels could be drawn between Elizabethan architecture, furniture and costumes. In the same way the next period in English decoration is equally consistent. Furniture and fitments are less massive than in the preceding epoch, and costumes lighter in color and texture. Comparisons could be drawn between Louis XIV furniture and the gorgeous apparel of the day; between the more ornate furniture of the reign of Louis XV and the greater extravagance in fashions; between the simpler Louis XIV furniture and the return of the French court under Marie Antoinette to a more refined mode of dress; between the classic furniture of Napoleon's time and the severe gowns of the Empire; and between the stately furniture of the Colonial period and the equally stately costumes. Turning backward to the Gothic period, the pointed arch was long a dominant note in furniture as well as in architecture. This was the age of the high pointed headdress for women, the peaked hat for men, and pointed shoes for all persons of rank.

All through these important decorative periods, color schemes were changing, expanding, developing—making a highly interesting study as a preface to present day color harmonies. Modern colors—modernistic colors, to speak more correctly—have been well summed up in the following paragraph quoted from a well known magazine on house furnishing. To read the list is to realize anew that we are living in an age of wonderful opportunities; the old decorators might well envy so rich a field.

"The most interesting new colors and combinations of color come from the modernists. They are responsible for the use of stripes in blends of one color in preference to contrasting hues. This treatment is found in fabrics, wall papers, rugs, porcelain and painted walls. Among the colors for walls this season are peach and apricot, beige, tan with a pink cast, blue-green, crisp lettuce green, mauve, ashes of roses, primrose, yellow, hydrangea blue, chalk blue and turquoise. If you are a modernist you will indulge in such colors as chartreuse green, citron yellow, honey beige, coral, henna, lacquer red, sky-blue, pencil blue; peach shading into brown with accents of copper; gray and black with touches of silver; orange, yellow and silver; chartreuse, blue and silver; white with honey beige; silver, dark blue and jade; tete de negre with lemon yellow and cream; lacquer red, lemon yellow and beige, and brown shading through beige to cream. Chartreuse green and lemon yellow are favorite colors of the modernists;

silver is widely used and all white is extremely effective."

Theoretical Color. There are many theories in regard to color. The artist holds to certain principles based on the spectrum, or rainbow, and expresses himself in pigments —actual paints. The scientist studies the spectrum from the angle of light, and expresses himself in terms too technical for the average person to follow.

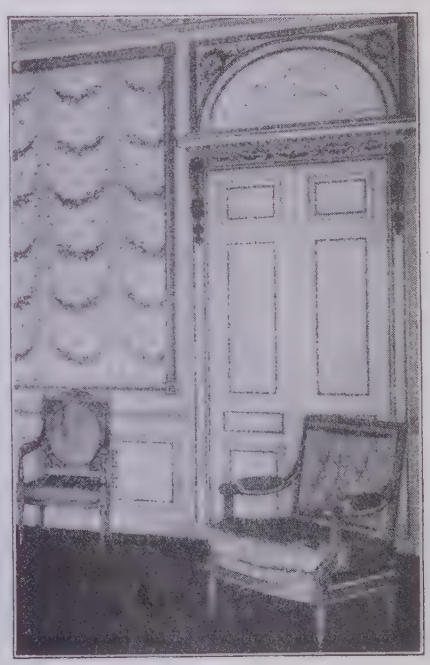
Valuable and important as are the color deductions based on light, they have little bearing on interior decoration. They are for the laboratory, not the studio or the workshop, and lead only to confusion when a practical demonstration is attempted by the student. The old theory of the spectrum is the safest to follow, easiest to understand, and simplest in its application. With this theory, red, blue and yellow are the primaries; and green, orange and violet are the secondaries. The secondaries are obtained, as most of us learned in our kindergarten days, by combining two primaries: thus red and yellow make orange; blue and yellow, green; and blue and red, violet. The complementary color of red is green, because no red enters into the composition of green; violet is the complement of yellow, for there is no yellow in violet; and so with blue and its complement, orange. There is no blue in orange. All this we studied in early grades; but we also learned that the tertiary colors are formed by blending two secondary colors, and that they are slate, russet and citrine. Possibly we went a step farther, mixing the imaginary colors and finding olive, sage and plum.

When we turn to the actual decorating of a room we often travel far from these familiar principles. We find that we prefer green and orange, green and violet, yellow and green, yellow and blue to the actual complements. We may also find that we prefer a three-color harmony to the more direct and primitive two-color combinations. Still, the value of the spectrum as a working base upon which to build theoretical color schemes is too great to be disregarded. And in this connection a color chart or series of charts will be found a necessity.

Using Color Charts. There are several on the market. The Prang set of eight color plates is an excellent working guide. Chart I shows the three primary colors; Chart II, the primaries and the secondaries arranged in a circle in the order of the spectrum. Chart III repeats the circle, adding a group of normal colors and tints, as orange, light orange and lighter orange; blue, light blue and lighter blue. Chart IV retains the circle of primaries and secondaries, adding normal color, tints and shades, as yellow, light yellow and dark yellow, and green, light green and dark green. Chart V introduces neutral gray in the center of the circle, showing by means of small squares how gray is secured from the complementary colors. One part yellow and one part violet make neutral gray; one part red and one part green make neutral gray, and in the same way one part blue and one part orange make neutral gray. Also on this chart we have gray-red, gray-green, gray-yellow, gray-violet, gray-blue and gray-orange. Chart VI presents the circle extended to include the intermediate colors as yellow-green between yellow and green, blue-green between green and blue, blue-violet between blue and violet, red-violet between violet and red, red-orange between red and orange and yellow-orange between orange and yellow.

The process by which these intermediate tones are secured is clearly shown. Three parts red and one part yellow make red-orange; three parts red and one part blue make red-violet, and so on around the circle. In Chart VII the circle of Chart VI is repeated with the addition of the grayed colors. The process by which the grayed colors are secured is given. As is the case with neutral gray, a standard color is united with its complement; but instead of an equal-part mixture, it is in the ratio of three to one. Three parts yellow and one part violet make gray-yellow; three parts orange and one part blue make gray-orange; three parts green and one part red make gray-green, and so with gray-red, gray-blue and gray-violet.

In the final Chart, No. VIII, colors in one half and one fourth intensity are shown together with monochromatic, analogous and complementary schemes. A monochromatic scheme is composed of different tones of one color, either of value or intensity, as light blue, blue and dark blue; or these same colors grayed in varying degrees of strength; and so on with all the spectrum's hues. Analogous color schemes are those similar in tone and adjacent in the color circle, as yellow, yellow-green and green or blue, blue-violet and violet. Complementary schemes call for no comment except to emphasize the fact that in addition to the three principal complements, as red and green, blue and orange, yellow and violet, there are three additional complements, more subtle and consequently more useful to the decorator. They are red-violet and yellow-green, blue-violet and yellow-orange, red-orange and blue-green.



Color charts are valuable inasmuch as they demonstrate the laws of color and their application. While it is unnecessary to be closely bound by them, it is instructive and stimulating to give them at least a brief study. Many people have a natural color sense and instinctively choose harmonious combinations, while others lack this gift. The latter will find in moments of doubt that the charts are useful as reference. Many successful decorators pay little attention to the spectrum, and might not pass a simple examination as creditably as a third grade pupil. Others find it useful, and often very interesting, to be able to verify a color harmony. It is gratifying to find a reason for the instinctive selection of yellow-orange to accompany blue-violet, or red-violet to combine with yellow-green.

Color Preferences. The members of one family seldom have the same likes and dislikes. Red pleases one and offends another; yellow strongly appeals to a third; while blue is the chosen color of a fourth. These are not merely whims; there are reasons why one color produces pleasure, and another, the reverse. To many people green is restful, red stimulating and blue depressing. But under certain conditions these colors may have quite a different effect. Blue when combined with green or certain tones of yellow is anything but depressing; while red, if placed in a dark room, will so absorb the light as to make a room positively gloomy. Green holds its own, but is warm or cold according to the proportion of blue or yellow with which it is composed. Pure yellow is the most sunshiny color in existence, and more satisfactory in a north room than is red.

Color has the power, apparently, to alter the proportions of a room. Red contracts; blue and yellow expand; green, unless very dark, has little effect upon the room and keeps the walls, as decorators say, "well in place." Tan, gray and pink have the effect of adding space; while brown, unless very light, has the same quality as green.

If color is such an important factor in adding or diminishing space, in creating an impression of light or darkness, its possibilities are worthy of study. The difference between a successful interior and an unsuccessful one frequently hinges on this point.

Choosing Color Schemes for Rooms of Various Exposures. Before deciding the color scheme of a room the amount of light must be taken into consideration, and this condition will be governed by the exposures, the number and size of the windows, and by the nearness of other buildings. If the house is in the country, there will be other considerations. Sometimes the living room is shaded by trees and sometimes by a porch, both of which make a difference in the amount of light.

Louis XVI Room
Showing chairs. Metropolitan Museum.

In rooms with windows facing south and east, cool greens, blues, mauves (if they contain a good deal of blue) and most of the grays can be used. Mauve is a color little favored in decoration in America. It is not recommended with oak; but when used as English decorators employ it, with ivory paint and certain shades of green and often rose and soft blue, it is very effective. In rooms having only eastern exposures, cool colors should again be used; but they would better be a shade lighter than when chosen for south-

east rooms, as east rooms are comparatively dark in the afternoon.

Northeast rooms are attractive in warm but not intense tones. The difference between the apparent light of a room hung in blue-green and one in yellow-green, is marked. North rooms are brightened by buff, yellow, orange, light yellow-green, and warm gray. Green for a north room should be of a yellow cast. True red should never be used for walls, for it absorbs light, nor should it be selected for a small room, no matter what exposure, because it contracts. Mauve possesses this latter quality, though in a lesser degree. The portly Queen Anne of England wore deep crimson on state occasions because it made her look smaller. The average house needs expansion rather than contraction. An occasional room is helped by claret, mulberry, Venetian red, or old-fashioned crimson; but it must be chosen by "one who knows," otherwise the color will be unduly prominent and proclaim itself in no gentle manner.

Sometimes a crimson textile the color of old vestments is used with telling effect as a wall covering, but only when a background is needed for old Italian furniture, or for rare Chinese teak, or for something else equally unusual. Where fine furniture has to be taken into consideration, the woodwork is often especially designed for it and the conditions are not those of the average room. Crimson makes a beautiful background for the faded gold of old Florentine frames, and for brass candlesticks and bronze lamps.

Northwest rooms receive a steady light from the north all day, and a strong light from the west in the afternoon. The colors should be warm but not bright, else the room will seem garish at a time when it is most used. West rooms are comparatively dark in the morning, and well lighted in the afternoon. A morning room facing west needs quite a different treatment from a living room facing west. What would make one cheerful and cozy would cause the other to be too bright. If a living room with a western exposure is shaded by a piazza it can take a fairly warm tone; for nothing so successfully cuts off the sun as a piazza, a fact which has practically doomed the long veranda.

Color treatment in relation to the amount of light received in a room is a broad subject, and all such suggestions must be general, unless certain rooms are under discussion. Color schemes change from time to time. The strong colors in vogue for walls a few years ago have given place to lighter, more transparent tones, but never at any time have such brilliant and fascinating colors been used in accessories as today.

PLANNING THE DECORATIVE TREATMENT

Before the decorative scheme of a room is determined, the architectural features must be taken into consideration—whether the room has a wainscot or merely a baseboard; whether there is a wooden cornice; and finally, whether the doors and windows are so constructed that certain treatments are prohibitive. The custom of the past in regard to the interior of our houses is seldom considered today. If it were, we would treat our wall as an order, and insist on the classic, divisions. The dado, intermediate wall space frieze and cornice are survivals of the old idea that the interior wall must be treated with the same architectural balance and symmetry that was once accorded the exterior. In other words, the wall of a room must embody or at least suggest the divisions of a column with base, pedestal, shaft, capital and so forth. It would be interesting to note this development from Greek and Roman times, through its various phases, down to the mid-nineteenth century, when the dado and the frieze were a part of every wall paper pattern. The Greeks and Romans used stone and marble for an interior finish; later a crude plaster, then wood, next tapestry combined with wood, and finally wall paper were used. The paper dado was a substitute for the early base of marble and the later base of wood.

Mid-Eighteenth Century Curtain Treatment

Typical curtain treatment in a room from the Hewlitt House, Woodbury, Long Island, New York. Mid-eighteenth century. American Wing, Metropolitan Museum.

There are theoretical decorators who still make a strong plea for a more architectural division of walls; who insist that there should always be a strong supporting base; and who contend that the cornice should appear to be supported—if not by columns or pilasters, which would be the ideal way—at least by something.

The paper dado, often made to look like marble or wood, was a tremendous sham. It was darker than the paper used above, and looked more solid—that was all; even when strips of paper suggesting wood or marble were used vertically at the corners of the room, nothing was gained architecturally. A later taste discarded the dado, found the frieze ugly, and went to the extreme of papering the side wall from baseboard to cornice with one pattern, using a plain ceiling in place of a figured ceiling paper.

The modern room has a truer architectural feeling, but it is due to the architect, not to the decorator, which is quite as it should be. It is not the decorator's mission to keep the walls in place, nor to prevent the ceiling of the room from looking as though it would tumble down on the heads of the occupants. The decorator was out of his field when he was trying to hold the room together by means of a paper dado.

The architect of today uses wood as it was made to be used—as a structural part of the room. We are speaking now of the trim of the room, of the exposed woodwork. Possibly architects of the middle of the nineteenth century shirked their duties, and threw the responsibility on the decorator, who in turn fell back on the wall paper manufacturer.

Harmonizing Furniture and Background. Probably the hardest, as well as the most common, problem of house furnishing is to reconcile old furniture with new woodwork: not antique furniture which can, with a little care, be adapted to the newest setting, but furniture neither old nor new and which might be called "middle-aged." It does not match the woodwork, nor does it harmonize. Matching is not required; in some cases it is to be avoided, but harmony is essential. Mahogany furniture and white woodwork do not match; but no background so satisfactory as simple white paint has yet been found for Colonial furniture. Its historical accuracy is an important factor, but that does not explain all its charm. There are several combinations, founded on precedent, which do not give the same satisfaction.

The style of the room should, if possible, determine the contents; and happy are those who can build first and then buy their furniture. The logical sequence is: first the floor and wall treatment, both based on architectural conditions; and then the furniture. If the house is of the half-timbered style, with an interior finish conforming to the exterior, the best effects are obtained by oak furniture of the same general tone as the trim. The designs should be sturdy and simple and in harmony with the setting. Old oak is particularly appropriate with walls of plaster and a sturdy trim.

Old oak suggests, to many minds, pieces

so scarce and expensive as to be almost unattainable; but if purchased under favorable circumstances they can be secured at prices which compare well with those of old mahogany. Old furniture is now regarded by the decorator with almost as keen an interest as that of the collector. According to Allen French, we no longer collect old furniture. We furnish our houses with it, and thus get the interest on our money from the use of the things we buy.

Whether the furniture be old or new, unity should be preserved if possible; but unity must not be confused with monotony. A certain diversity of tone and texture is necessary; but the juxtaposition of mahogany furniture and dark oak woodwork, or light oak furniture and white paint, should be avoided.

With the severe trims now favored by many architects and growing in popularity, furniture to be in harmony must be of severe lines also. This does not mean that all pieces should match or all be cut on angular lines. It does mean that gilt-framed chairs should be absent, that ornate pieces if numbered among the household possessions should be placed elsewhere, and that a general harmony should prevail. This harmony may include furniture of different periods if there is a structural similarity and the woods do not conflict. But there must be taste and discrimination back of the selections. Oak and walnut and even mahogany, if the latter be of a brown tone and not the ruddy color of the American Empire style, could, under some circumstances, be placed in one room.

When the interior is finished it is seldom possible to change the permanent features. Therefore, the choice of furniture should be postponed until the fundamental features of each room have been decided. Better spend less on the house than build at such an outlay that the furniture of an outworn and outgrown home must be used. Not that all furniture which is neither antique nor very new should be thrown away. A great deal can be accomplished by a skilled workman in "doing over" unsatisfactory pieces. Clumsy black walnut can be remodeled, light oak can be scraped and refinished, and the services of an upholsterer can be put to most excellent use. But a careful weeding-out process is imperative lest the new home will be less successful than the old where the rooms, if faulty, were at least consistent.

In a Colonial house where the interior is designed to accord with the exterior, furnishing presents few perplexities. Mahogany of Colonial design should be chosen for the main rooms of the first floor and preferably for the bedrooms. The merits of well-made reproductions should be emphasized. Where rooms are detached from the main part of the house, the treatment may be more individual. Studies, libraries and smoking rooms are often so located as to permit a different scheme of decorating and furnishing.

When a good deal of fine old mahogany is owned by a prospective builder, it is well to take this fact into consideration, and to plan the rooms to fit the furniture. People who care a great deal for old furniture usually wish a Colonial house, and in that case the problems of designing and furnishing are reduced to a minimum. But the jewels must be worthy of the casket. It is folly to build on Colonial lines for the sake of a few old blue plates and a four-post bedstead. Modern housebuilding proceeds on clearly defined lines. The interior trims are designed with infinite pains; doors, windows, mantels are usually part of a consistent whole. The architect has given every possible assistance to the decorator and furnisher.

The Living Room. Of late the word "library" has lost its original significance, and is often used interchangeably with living room. The average house does not contain sufficient space for a book room pure and simple; so the tendency has been to combine the sitting room with the library, a plan which has both advantages and disadvantages. There is an undoubted charm to the well-appointed living room with its books, pictures and comfortable furniture. It is often the largest room in the house, and has grown to be an expected feature of the modern house. The shrinkage in the hall in the modern ground-floor plan is largely due to the increased size of the living room. It is in this big room that not infrequently the architect does his best work.

If the decorator is equally successful, the color scheme is quiet and restful, and the room is probably the most attractive of the house; but it cannot be called a book room, and the term "library" is usually misapplied. If the room has but a few books, so that low, built-in cases on either side of the fireplace will suffice for their keeping, the word library is inappropriate, and it is better to use the term "living room." Where bookcases extend around the entire room and the atmosphere is one of books "library" might be used, although in the average house this room will also be the living room.

Whether the room has few or many volumes it has several distinctive features; and since it is the part of the house most used by the family, it is worthy of the decorator's best efforts. In the well-designed house the architect has given every assistance to the decorator; and if the latter does not err the room cannot fail to be attractive, unless it is marred by the unfortunate final touches which many householders consider necessary. There is really very little to do to the living room, for the architect has done so much. The well-designed trim, usually in the form of a high wainscot; the generous fireplace, often extending to the ceiling; and the built-in bookcases occupy most of the wall space. There is little space to be decorated, and the simpler this little is treated, the better.

Where the trim is oak, the ceiling beamed, and the fireplace of brick, sand-finished plaster furnishes a satisfactory wall treatment. It provides a consistent background for the simple, sturdy furniture necessary in a room used as a library. Such a wall treatment makes superfluous the use of many pictures. In fact the room is better for their absence, unless they be few in number and carefully selected. Prints suit well the atmosphere of this room, but should be of secondary importance to the books. If there are many prints, a plain paper or textile makes a better background than does plaster; for it, by reason of its largeness and simplicity, is ill-suited to many pictures. It is a decoration in itself with its lights and shadows, and shows to best advantage when seen in large, unbroken masses. Whether stained or left in its natural color, it has claims to consideration, particularly in a half-timbered house. Unstained plaster, if there is a good deal of oak woodwork in the room, gives splendid results. Many people find it colorless; but this is because they do not see color except in strong tones. They are not gifted with an eye for color, and have not been trained to look for it. Ivory plaster is an attractive wall finish; so are the lighter grays and some yellows.

Decorative Value of Metals Skillfully Arrayed

Broadly speaking, rooms finished in dark wood need stronger tones than rooms where white paint or light woods are used. But there are many exceptions, notably the combination of unstained plaster with dark oak. A beautiful living room is recalled where the trim is Circassian and the furniture old Italian walnut. On the walls is an oil stain of warm ivory color. Old rose curtains and rugs in which old rose is the principal color, form the only strong color notes. Soft related color, as silver-blue and mignonette-green, are combined with the rose and ivory.

In a Colonial living room an old landscape paper is sometimes very effective, particularly if the bookcases are low, and the paper is regarded as a decoration and not made a background for pictures. Some of these old papers are in two tones of gray, whereas others are

more brilliant and require plain curtains and comparatively plain rugs. The rugs for a library are usually deeper in coloring than those selected for a drawing room, for the whole scheme of color is in a lower key. A rug lighter than the walls will throw a room out of scale, and it is well to remember the old rule that the floor should be darker than the walls, and the walls darker than the ceiling.

In a room where the trim is white, built-in bookcases should be white also. Detached cases of mahogany are harmonious in a library done in Colonial style. Sometimes a high, old-fashioned bookcase of mahogany is effective in a room where the built-in cases are painted white. Placed between two windows, or where it will balance a door, it usually helps the proportions of the room. When finished with traceried glass it forms a

Dining Room
Dignity and character are here portrayed in the massive furniture of this room.

fitting storing-place for books with fine bindings. Such a piece of furniture is particularly useful where there are rare books, for most built-in bookcases are without glass doors. If there are many books, and the locality is a dusty one, glass is necessary for protection, although the charm of the open shelf admits of no dispute. There is something very intimate and personal about shelves filled with volumes in reach of every member of the family; but the bindings often suffer from dust, dampness, and particularly from heat, which is one of the great enemies of books.

Where a library is constantly growing, sectional cases have many desirable features, and there is no question of the protection that this type of bookcase gives. Great improvements have been made in sectional designs, and it is now possible to buy bookcases which conform to all styles of interior trims. The old criticism that they were unnecessarily deep and consequently took up a great deal of room does not hold good, for the improved type is of admirable proportions. They are also recommended on the ground of economy and durability.

The low, built-in bookcase has been extensively used in this country, but its popularity is now diminishing. A scheme growing in favor is to sink the shelves in the walls and, if the room is paneled, to place them in such a way as to add to architectural value. Frequently, when a real book room is desired, the shelves are built flush with the walls; and if the books are not of sufficient number to line the room, the additional space is paneled. Sometimes these panels are made with doors which can be removed at any time as additional shelves are needed. Rooms of this character have a dignity which it is not possible for the living room to achieve; and while doubtless more costly in the beginning on account of the paneling, the extra cost, if space permit, would be justified.

In a living room, the space on each side of the fireplace could be filled with shelves built flush with the walls, or one end of the room could be thus treated, and if the shelves balanced a fireplace or a group of windows, an additional beauty would be gained. Architects delight in planning such schemes, and would doubtless be glad to depart oftener from cut-and-dried traditions.

In one delightful city house the bookcases are in the form of alcoves, such as are seen in the Bodleian at Oxford and other famous English libraries. A great many volumes can be housed in this way, but it needs a master-hand to design the cases, and it also requires a large room where the light is well distributed. Such a place is always the library—never the living room.

What the living-room-library walls should contain besides books, depends on the extent of the wall space and the taste of the owners. It is seldom in the decorator's province to plan the pictures. This is sometimes fortunate, sometimes otherwise. Many beautiful living rooms are ruined by crowded walls quite as often as by cluttered mantelpieces. If the walls are hung in grass-cloth, buckram, burlap, or other plain textile, an excellent background is provided for photographs, prints or engravings. Where the bookcases extend around the room, a print collection looks very well strung along the wall, over the cases. Black-and-white prints are particularly effective thus treated. A good many prints may be used in this manner without marring the quiet of the room whereas if hung differently, they would seem to fill the wall space. If, after the books are in place, a few big things are added such as a beautiful picture, a decorative bas-relief, or a really fine piece of bronze, little more is needed. The books in their colored bindings are part of the wall treatment, and this fact should be taken into consideration in planning the decorative scheme. The books, the well-designed woodwork and the comfortable furniture, the generous fireplace and above all the homelike and livable atmosphere, make of this room the very heart of the house.

The Dining Room. For many years it was an accepted idea that dining rooms should be massive in treatment no matter what the rest of the house was like. This theory gave us the really beautiful room hung in subdued leathers and furnished in carved oak. It also gave us the dining room walled in dark paper, furnished in black walnut, and curtained in maroon. Maroon in a dining room was not cheering; it seldom waited on digestion.

The "baronial" type, when well executed, had dignity and a certain heavy beauty. Today, in houses where there are two dining rooms—one for the family and one for entertaining—carved oak and walls of Cordova leather still make an acceptable combination; but the color scheme is not quite the same as it was in the late seventies. The walls are never gloomy, and the great improvement in lighting causes these rooms to have an atmosphere that they could not have in the days of the garish chandelier. Old Flemish oak, Spanish oak, Jacobean oak or well-executed modern copies are usually found in these apartments, and all the details are carried out admirably. Such schemes are expensive. They cannot be imitated in a cheap way, and the wise decorator does not try to do it.

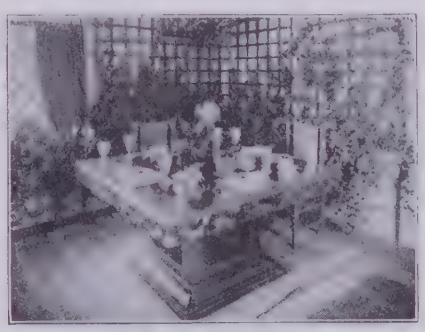
A dining room treatment usually gives best results when it conforms to the general scheme of the house, and presents no startling contrasts in the way of woodwork and furniture. There are exceptions, however. Sometimes a dining room may be decorated and furnished in Colonial style and the rest of the house in oak; but the architect must pave the way for this arrangement.

The beauties of a Colonial dining room are many. The conditions are clearly defined and well known. Possibly the walls are paneled and, if so, no further adornment is needed. The old furniture makers were inspired when it came to their designs for dining rooms. Therefore, if you select old mahogany pieces or authentic reproductions, your room cannot fail to have charm. Do not combine a Sheraton sideboard with an American Empire table. If you wish your table to have a round center column, select a sideboard to harmonize with it. Both will then be American Empire. It may be that an old sideboard is the beginning of the dining room furniture. The table and chairs may then be purchased to correspond. Often it will be necessary to buy chairs of modern make. Do not put new chairs of Chippendale style with the sideboard and table of American Empire. If you wish chairs of Chippendale pattern, choose a sideboard of contemporary design. It is now believed that Chippendale made no sideboards, but several contemporaries achieved success in this line. Shearer, Hepplewhite and Sheraton made designs which may be used with Chippendale chairs. Hepplewhite and Sheraton were also famous chair makers, and it is sometimes possible to secure their designs.

Furniture makers of today have given special prominence to the American Empire table. It is one of the most substantial of designs, may be easily extended, and seldom interferes with the feet of diners—three important considerations.

There are of course houses where a Colonial dining room would be out of place. In many instances an oak treatment would be more harmonious, particularly where the main rooms of the ground floor are finished in oak. An oak dining room may be made extremely attractive. There is greater latitude in furnishing in this wood than in mahogany, for the variety of design is more extensive. An oak dining room may contain furniture of plainest design or old oak, where every piece represents a large outlay. Perhaps oak of the Tudor or Jacobean periods will be used, or rarer still, Gothic types of French or Italian extraction. There are also dining rooms decorated in various French styles, or in Italian Renaissance or early Spanish. Occasionally, too, rooms which are Pompeian,

Grecian or Byzantine may be found. A few of these unusual apartments represent the highest skill of the architect and the decorator, and a cultivated taste on the part of the owner. Unfortunately, however, a greater number are neither accurate nor beautiful, and suggest only a vast outlay of money. Others are beautiful in themselves, but out of harmony with their surroundings.



The wisdom of period decorating must be determined by the householder. Sometimes the period room is very successful. Sometimes it leaves much to be desired. It is a mistake to think that it costs more to limit the decoration and furnishing to one style than to furnish in a more general manner. Many period schemes are expensive but many are not, and there are countless rooms in Colonial, Louis XVI and Jacobean styles which cost no more than the rather indefinite way of furnishing found in the average house. It is not so easy to make mistakes in a dining room as in other portions of the house, for the requirements are clearly defined. It is not possible to place the miscellaneous bric-a-brac and pictures often found in a living room, and this absence has more to do with the beauty of many dining rooms than the actual presence of fine furniture and silver. A very simple room, and often a very inexpensive one, has more charm than a room richly furnished if filled with articles which plainly do not belong there. A dining room should never be made a curio place, for utility must come first, and out of utility will grow beauty.

Many dining rooms, in spite of beautiful furniture and harmonious color schemes, produce an impression of tiring confusion. Too much has been attempted in the way of embellishment, and the result is a crowded room less satisfactory than many cheaper apartments where a finer restraint is shown.

A dining room in the country is recalled where the woodwork is painted white and the walls are covered in gray paper carrying white stripes and baskets of flowers in pinks and lavenders. The design is formal and full of decorative feeling. In this room the furniture is light gray picked out with white. The floor is painted gray and the one big rug has a green ground, the color of the leaves, with short-stemmed flowers in pink and lavender forming a thick border. The rug is an imported one and Walter Crane in feeling. The green is not pronounced, and the effect is flat and decorative. The curtains are in leaf-green lined with lavender, and the china is peasant ware painted in splashy nosegays and outlined in green. The room contains no pictures. The only ornaments, if ornaments they may be called, are small bay trees in green boxes and flowers arranged in a rather formal manner in plain green jars.

The Breakfast Room. Many large dining rooms have a breakfast bay which contains a table smaller than the main dining table. Here breakfast is served, and often the informal luncheon. Such a scheme is convenient and a great saving in service. Where there is sufficient space a breakfast room fills the requirements even better, and such a place offers scope for an interesting treatment. This room may well be quite different from the rest of the main floor, as it is usually placed where it does not become a part of the decorative scheme of the house. Therefore quite a radical treatment is permissible. Painted furniture goes well here, as do papers of gay and striking patterns. It is a day room, consequently the question, "How will it look with artificial light?" does not have to be answered.

Furniture, painted white, when combined with a white trim and walls of decorative pattern, gives good results; so does furniture painted green, and one charming breakfast room is recalled where the furniture and the woodwork were painted a peacock blue. The paper had a white ground with small, brilliantly colored peacocks seen through branches of green leaves. A rug of Scotch weave with a green center and a border in which peacock shades were blended with green, covered the floor to within six inches of the wall on all

Breakfast Porch

Climbing vines add charm to this porch in a summer home at Easthampton, Long Island.

four sides. This floor matched the trim and furniture. White ruffled curtains hung at the windows without additional draperies—an old fashioned treatment which is sometimes very attractive. In the paper was a little orange, and this was repeated in a runner on the long, narrow table. The runner was of coarse canvas and had for a border small bay trees in green cross-stitch. On a narrow mantel were two dwarf trees in tubs painted blue. Inexpensive peasant china suited the room in a manner that more costly pieces would not have done.

Another room was equally interesting, though more difficult of execution. Six old rush-seated chairs with yellow frames decorated in grapes suggested the scheme of decoration for this room. A round table of common pine was painted yellow and embellished with bunches of grapes in a wide border. They were painted in the manner of the old chairs, which was a crude but an effective treatment. Leaves as well as grapes were painted, forming a deep band which was enclosed by a broad painted line. Something unusual was wanted for the walls and finally a paper was found, a copy of a pattern made in 1820. The wall had the effect of being paneled in small squares in green and yellow with a basket holding fruit in the center of each. This design was in line with the chairs and was, in fact, the same period. The woodwork and the floor were painted green and a large circular rug in black, green, gray and yellow was used.

The Bedroom. The essentials in a bedroom are good ventilation, sunshine, soundproof floors, convenient furniture, sufficient space and a pleasing scheme of decoration.

Architects, in discarding the old-fashioned spacious bedroom, went to the other extreme and designed rooms far too small for adequate treatment. The pendulum is now swinging back.

A fault with the usual bedroom is that it contains so many unnecessary things; photographs and trifling little articles which serve no use, possess little beauty, and make order extremely difficult. If any room should be simple in all its appointments, it is a bedroom. A few pictures and two or three interesting accessories are all the room needs, and the latter should be useful. A second fault is a restless wall treatment, and this point raises the important question as to whether the wall covering should be plain or figured. This is largely a question of individual preference, but other considerations enter into the matter. If the room when completely furnished is crowded, the walls should be plain. A patterned wall, no matter how pleasing, will add a certain confusion. Figured walls at all times demand a rather bare scheme of furnishing. Use plain schemes if you have much furniture, or if the wall space is broken by many doors and windows. It is needless to say that pictures against a figured wall are fatiguing and uninteresting—a condition very unfair to the pictures, which deserve a more discriminating treatment. Just how many family photographs should congregate here is also a personal matter. A plea might be made to keep unframed photographs in a portfolio, and to keep out all small snapshots only so long as they are of real interest, or to conceal them entirely. Their interest is usually fleeting.

Where a figured wall is desired—and in a spacious room it may be made very attractive—there are many admirable American, English and French papers from which to make selections. The same principles of balance, harmony, emphasis amd rhythm hold good here as elsewhere. Restful, but not monotonous, schemes; cheerful, but not garish, are desirable. If a plain wall is preferred, there are many preparations on the market, the merits of which may be emphasized. A plain wall is most effective when there is a slight roughness to the surface. A perfectly smooth, even finish lacks tone and texture. As decorators say, it "flattens out," making a poor background at all times, growing hard and harsh by artificial light. Many wall preparations are satisfactory from a sanitary standpoint, and some may be washed without detriment. These features are especially desirable in a sleeping room, and well worth considering in other parts of the house. Plain tones are pleasing in combination with chintz hangings. Bedroom schemes may be carried out in many ways. Success is not bound up in any one kind of wall treatment, nor in any one style of furniture; nor is expense always a factor. A room may have costly furniture and be a flat failure as a sleeping room, and it may have painted cottage furniture of the plainest kind and be a haven of rest. But whatever it may or may not have, air, sunshine and order are essentials.

Rugs. Oriental rugs are divided into four general classifications based on geographical sections. Chinese rugs form a fifth and im-

portant addition. Persian designs are largely floral; Turkish, conventionalized in pattern; Caucasian, geometric; and Turkoman, octagonal. The four general divisions are:

(1) Persian (Iran), including Bijar, Feraghan, Gorevan, Hamadan, Herat, Herez, Ispahan, Kara-Dagh, Kermanshah, Khorassan, Kirman, Kurdistan, Kashan, Meshed, Mosul, Muskabad, Saraband, Sarakhs, Saruk, Sehna, Shiraz, Sultanabad, Tabriz, Teheran;

(2) Turkish (Asia Minor) embracing Anatolian, Bergamo, Ghiordes, Kaisarish, Karaman, Kir-Shehr, Kulah, Kurd, Ladik, Meles, Oushak, Smyrna, Suruk;

(3) Caucasian, comprising Baku, Cashmere, Daghestan, Derbend, Genghis, Kabistan, Karabagh, Kazak, Lesghian, Malgaran, Shirvan, Soumak, Tcherkess, Tzitzi and

(4) Turkoman (Afghanistan, Turkestan and Beluchistan) including Afghan, Beluchistan, Bokhara (Tekke, Khiva, Yomud), Kashgar, Samarkand, Yarkand.

On the choice of the rugs for a house often hangs the success or failure of a decorative scheme. Better delay the furnishings than compromise on unsatisfactory floor coverings. At the outset, one question should be given careful consideration: are the rugs to be plain or figured, to be part of the background or part of the decoration? Taste in interior fitments goes to extremes. At one time no rug but an Oriental pleased us; today there is a revival of the large rug of one solid tone. If the use of the Oriental sometimes became the abuse of the Oriental, it is no less true that the plain floor covering has received an undue amount of attention. Both have their place in the scheme of things. Sometimes the rug of one tone holds and binds the scheme; sometimes a figured surface is needed to give balance and contrast. In either case the real mission of the rug is to act as a foundation. If it does not meet this test it is a failure, regardless of cost or beauty. This viewpoint is that of the decorator, not the rug collector who, naturally, brings a different aspect to bear on the subject.

Many people well posted on Van Dyck and Rembrandt, who would not confuse Chippendale with Sheraton, nor mistake Wedgwood for Crown Derby, have very vague ideas about rugs. "Oriental" is an elastic term covering everything made in the Asiatic countries. "Prayer" rugs, by reason of their distinctive design, stand apart; and Bokharas, thanks to numerous reproductions, are easily recognized. But the broad classifications of Persian, Turkish, Caucasian and Turkoman are regarded as too complicated for the average mind.

Writers on the subject have discouraged the amateurs by seldom agreeing on a common basis of terms, and by illustrating the rarest specimens in the respective groups. The famous rugs of the world are very important as object lessons. They represent the highest skill of the old weavers; and their place in history, romance and the arts cannot be disputed. But a book dealing with modern rugs in relation to modern rooms; rugs classified by color and pattern; rugs best suited to mahogany, to oak, to painted furniture, would be of practical value. The amateur decorator is seldom a connoisseur.

The devout Oriental removing his shoes at the threshold has no counterpart in our civilization. We put our beautiful rugs to base uses when measured by the standards of the East. We place on our floors rugs intended to be hung on the walls, and we grind under our heels the precious prayer designs.

Possibly the attitude of the modern weaver is growing commercial. Aniline dyes and Western influence have altered the old traditions. But even today to a great extent does the Turk, if not the Persian, regard the prayer rug as sacred.

In choosing Oriental specimens, another point must be taken into consideration. Does the design lie flat? Is the composition one that may be viewed from four sides, or is there a top to the pattern? Without going too deeply into the fascinating phase of realistic, semi-realistic and conventionalized designs, it may be said that the Turkish,

Turkoman and Caucasian examples show a more geometric rendering than the Persian. Bokhara is a good example under the Turkoman or Turkestan group. Indeed the flatness and simplicity of this design have given it a tremendous vogue. Not only has the Bokhara octagon been woven over and over in European and American rugs, but it has been copied in other mediums.

The rich wine shades of Bokharas are well adapted to oak paneling, oak furniture and to the color schemes which are often selected for living rooms and libraries. Old specimens, whether of the so-called Royal or Princess class, are very valuable, having a bloom which time alone can give. Modern Bokharas compare favorably with modern Kazaks, Kelims, Samarkands and Kabistans in wearing qualities and in price. Modern Persians, woven after old designs but sometimes with different dyes, present so many phases that they must be studied first-hand. The various names beckon to further investigation, so associated are they with the golden age of Asiatic weaving—Gorevans, Kashans, Sennas, Feraghans, Serabands, Saruks, Sultanabads, Herats, Kermanshas, Khorasans and others.

Persian designers are masters of the use of floral and animal forms. In rugs, in missals and enamels, in tiles and pottery, their skill is set forth. Especially in the old "hunting rugs" is their ability in this particular most cleverly shown. No matter how covered the surface may be with flowers, birds and animals, the effect is that of a design, not a picture. Even when there is a top, as is the case with many of the garden rugs and always with the prayer rugs, the composition is beautifully handled. European weavers have seldom attained this wonderful flatness in the arrangement of floral motives. One has merely to mention carpet designing of the Victorian period to call to mind the opposite effect. Body Brussels in rose pattern, for instance, when petals were apparently crushed with every footstep, is a typical example.

"Hunting" rugs are seldom copied in modern weaves, but the "garden" and "tree of life" designs are occasionally found in the shops. As wall decorations, these beautiful old designs in modern wool and silk are wonderfully effective; and this brings us to a neglected phase in the use of rugs. We are all familiar with museum specimens hung on walls for preservation; but few of us ever see in a private house, unless that of a collector, a rug used as a wall decoration. Yet many rooms would gain in beauty and distinction if this plan were followed. Naturally an interesting example must be chosen—one with a design composing well as an upright panel, and with a color harmony carefully related to the room. Particularly where a plain textile is used on the floor would the patterned rug lend interest to the wall.

As covers for tables, the smaller Caucasian designs are well worth considering—one or two in a house, perhaps, chosen like the wall rug, with much discretion, and used only where both beauty and utility are served. Cushion rugs are now on the market and these, under favorable circumstances, have their place for interior use. Chinese mats are beautiful in tone and design, as are the scarcer Turkish and Turkoman mats. Cushions covered with these colorful articles are most effective when used in a formal row on a narrow, straight settee. They are never lounging cushions, and their value lies in their rich color and dignified character.

No mention of modern Persian rugs would be complete without reference to the Sharistans woven by hand on looms owned in this country. The designs are based on famous rugs of the fifteenth and sixteenth centuries, and made to order. The best traditions of the past are revived in these beautiful articles which have the life of a new rug combined with the bloom and glow of the treasured antique. The wonderful color harmony of the Sharistan—suggesting the softening influence of time, air and sunlight—is entirely a matter of weaving, not of washing or artificial aging. The fact that these rugs may be woven to fit any given space makes them very desirable for large rooms, while the color schemes are entirely in harmony with modern ideas of interior decoration.

The beauty of Chinese rugs needs no emphasis, so finely adapted are they to modern houses. The soft tans, deep yellows, pomegranate and apricot shades combined with black and imperial blue make a color foundation upon which many changes may be wrought in the way of furniture and accessories. Given a Chinese rug and the opportunity to build the scheme, a beautiful room may be evolved.

Few people realize the variety and scope of the weaving industry in this country. Rugs and tapestries setting forth the standards of the old French looms are being made under most interesting conditions. Flemish and French weavers design and work as their ancestors did in the seventeenth and eighteenth centuries. In one studio may be seen an Abusson rug designed by a Gobelin artist twice decorated by the French Government, as well as beautiful examples of Savonnerie rugs.

New industries have sprung into existence while a great stimulus has been given to established activities. For years America has taken high rank in the making of plain rugs and carpets and in the beautiful two-toned effects which decorators now use so extensively. Oriental patterns in the hands of several manufacturers have been reproduced with consummate skill, notably in such types as Anglo-Persian and Imperial Ispahan.

Mention must also be made of the old-fashioned hooked and braided rugs, either old or reproductions, finely adapted to certain rooms and growing in popularity. Within the next half dozen years great achievements may be expected from our own rug industries, and they will be well worth watching.

Pictures. Taste in decorative matters goes to extremes. The reaction against the overcrowded room with wall thickly strewn with pictures threatened to give us the pictureless house. And today many decorators claim that pictures mar, quite as often as they make, a room. This is undoubtedly true, but the subject is such an extensive one that it is impossible to dismiss it with a few platitudes; and it would be quite as sensible to say "Have no tables and chairs in your house" as to say "Have no pictures." Better no pictures than poor ones by all means; but also better no rugs than poor ones; better no curtains than poor ones, and so on through all household lines. Pictures as well as books are an education, and at no time in the world's history have both been so easy to procure as today. The very ease with which good photographs, prints and other reproductions may be purchased has made it fatally simple to obtain good things to hang on our walls, and the tendency to overdo the matter must be carefully guarded against.

Not only must pictures be carefully chosen and suitably framed, but they must be in keeping with their environment. When Henry Ward Beecher said that a house without pictures was like a body without a soul, he might have added, "when they are in harmony with their surroundings." Quite as many mistakes are made in the choice of frames for certain rooms as in the choice of frames for certain pictures. In fact both matters are too closely related to be separated.

Those who have always associated gold frames with oils do not realize what excellent results are occasionally obtained by the use of oak frames. A certain country house has woodwork of exceptional beauty, of the tone seen in Austrian interiors of the new school. In the living room and hall the trim is oak, stained gray with just a hint of green in it. The owner of this house is a collector of pictures, particularly of the modern Scandinavian landscapists. He did not wish to turn his house into a picture gallery, but he did want his masterpieces about him. Their broad decorative quality admirably suited the house, but their gold frames clashed with the whole architectural and decorative scheme. Even those framed in plain flat moldings seemed to proclaim the fact that they were bound in gold. An experiment was tried which proved very successful, and solved not only the framing problem but greatly enhanced the beauty of the landscapes. Broad flat frames of oak were stained to match the woodwork, and the canvases were hung against the plaster background. Each picture took on additional beauty. The broad sweep of sky and moor, of sea and coast, gained a new dignity. This treatment suited these particular pictures in this particular house, and it proved that the owner knew a good deal about the relation of canvas to wall treatment. In a large room on a second floor, on walls hung in the old red which is seen in many art galleries, are placed canvases of earlier and more diversified schools, and the frames are in gold of varying tones and styles each suiting the subject without any special reference to the woodwork or to the other pictures. It is a gallery, not a room. It is an interesting place to visit; but it would never tempt one to linger as do the big rooms downstairs where the landscapes, in their simple oak frames, form the chief interest.

Another point to be mentioned in connection with frames of pictures and trims of rooms, is that the greater the unity the more satisfactory the permanent result. If one wishes to hang many pictures it will be necessary to consider the framing in relation to wall treatment, else a very haphazard effect will be the result. If there are but a few pictures a diversity of framing will not make so much difference. Indeed it will in some cases be advisable, but if there are many pictures, the matter is not so easily settled.

Collections of black and whites, old or new color prints, and in fact all collections of uniform character, present few difficulties. It is the average miscellaneous assortment inherited or acquired at different times and purchased to conform with varying tastes, that makes a real problem of picture framing and picture hanging. Such assortments usually comprise water colors, oils, prints and photographs of old masters—the latter being by far the easiest to treat satisfactorily.

Many foreign photographs are sepia in tone, and simple wood frames without moldings are generally a safe choice. Circassian walnut suits many photographs, particularly the old Italian and French masters. Frames of Circassian are usually flat, or show a slight curve or rise well suited to a veneer. There is a variety of color in walnut, which is at present one of the most popular woods the frame maker has to offer. Sometimes walnut is almost as red as rosewood; again it is quite gray. If anything as ruddy as rosewood is wanted it is better to use that wood; and for certain color prints, rosewood with ebony corners is especially attractive. Sometimes a rosewood mat with an outer molding of ebony, the two presenting a perfectly flat surface, is a charming solution of the frame problem. Such a scheme is usually successful in a Colonial room. English color prints of the eighteenth century look very well in rosewood and in mahogany frames, and both rosewood and mahogany are harmonious with woodwork painted white.

Gold frames of certain character are attractive in rooms with a white trim, particularly if they are narrow oval frames or those of other old types. These may occasionally be picked up in the genuine, and at all times in good reproductions. Sometimes a color print looks better in wood, again it seems to need the gold to be at its best. These points may be decided by trying various frames, or by seeking the advice of the person who does the framing, for usually he knows whereof he speaks. He may not be familiar with the conditions in your rooms, but once they are known, he will be quick to seize the possibilities and give most helpful suggestions regarding the kind of frame, the proportion of the mat (if the picture is to be matted), the width of the molding and all the niceties to which the average person has paid little attention.

Mats at present are not so much in vogue as they were a few years ago; but it must be admitted that many pictures gain in beauty when mats are used. Water colors are usually helped by mats. White mats and white frames, once inseparably associated with water colors, are fortunately seldom seen. Gold mats and gold frames suit certain water colors well, as do mats of soft neutral tone when blending with both picture and frame.

Mats in relation to photographs may be profitably studied at the various photograph salons, where the problem is invariably handled with great skill. It is impossible to give definite rules about the use of mats. One woman who has a large collection of photographs used mats for all platinum prints and those of kindred finish, choosing them to harmonize with the tone of the photographs—gray or brown, as the case may be. All foreign photographs, which are of brighter surface, are framed "close" and are never hung side by side with the others.

Regarding all period framing, particularly Louis XV and Louis XVI, Empire and Renaissance, the picture dealer is usually better informed than the layman, who oftentimes does not know what he wants and therefore should be safely guided. Useful advice may be gained in regard to the tone of gold, if gold is to be used—whether red, yellow or green gold, and whether or not gold should be combined with wood. Sometimes an edge of gold inside a frame of wood gives tone and interest; again the picture is helped when the dark frame meets the picture without a line of separation. Photographs of old masters, particularly if they are large and destined for libraries, school rooms and similar places, are occasionally improved by a gold edge set within the frame. This gives

a better effect when in the form of a flat band rather than a beading. In a room with several gold frames and with several of stained wood (the first, for instance, framing colored prints and the others enclosing Braun photographs), the narrow edge of gold within the wood frame might be a decided help, tying the pictures together, as it were. This decorative scheme might also be a help to the walls. But if the room contained, in the way of pictures, only a collection of photographs, a better result would be gained by discarding the gold edge altogether.

Among gold frames, those of early Italian design are particularly interesting and usually more at home in the average living room than are those of the French periods. Louis XV and Louis XVI frames are at their best in rooms decorated in those styles and containing French subjects; but the Italian frame in low relief, and of a charming dull tone, falls into harmony against paneled wood, against any harmonious plain tone (whether paper, textile or calcimine) and under some conditions against a figured wall. Tapestry papers, if comparatively low in tone, make good background for Italian frames, particularly where color prints are used. And the exquisite color prints, color engravings, even colored photographs should not be overlooked by those fond of Renaissance subjects.

Colored engravings and various other color processes should be carefully studied. That distinguished bit of portraiture, *Beatrice d'Este* and the better known *Belle Ferroniere*, both attributed to Leonardo da Vinci, are remarkable for their depth of tone in colored engraving. Dull gold frames showing a bit of Renaissance detail admirably suit these subjects, and the slight ornamentation of the frame accentuates, and never subordinates, the picture. If the latter were the case, the frame would poorly fill its purpose. When a frame proclaims itself at the expense of the picture, the frame has not been wisely selected. It is too large, too ornamented, or possibly not correct in tone. The portraits mentioned may be purchased in photographs, plain or colored. If plain, Renaissance frames in walnut are advised; if colored, gold frames would be a better choice. Francesco's *Portrait of a Lady* comes out well in a colored photograph. And turning back a little to the early Florentines, what a host of beautiful things there are in color and in black and white—the Botticellis and Lippis and Fra Angelicos! They are good things to live with, whether we have Italian rooms or not; and if they be harmoniously framed they become just that much more livable and interesting.

Mezzotints in color form a class by themselves. Here we find French and English subjects more or less familiar. Many of these look well in gold frames.

Fragonard's *Lady Carving Her Initials*, however, looks better in Circassian or rosewood, for it seems to need wood tones. This fact indicates that no ironclad rules may be made about framing. The Louis XVI and Empire frames have a restraint which makes them more in tune with the average house than the Louis XV designs, and in many Colonial rooms will blend more effectively with walls and furniture.

English subjects of the eighteenth century, whether in monotone or color, seem to gravitate to mahogany and rosewood. The charm of these prints, whether old or new, needs no emphasis. Of modern mezzotints in color may be mentioned *Lady Hamilton as Nature* by Romney, engraving by Fred Millar; *Little Miss Maitland* by the same artist, engraved by Stevenson; *Lady Compton* by Sir Joshua Reynolds, engraved by Skrimshire, and a host of others, eighteenth century notables, who please a larger public than the earlier Italian subjects.

Let us not forget "modern art" in our quest for suitable subjects. The best of the modern movement will doubtless be beyond the average purse, but excellent reproductions in color and in black and white may be obtained. The frames for these highly decorative pictures must be carefully studied. Often the color scheme of the composition may be repeated in the inner framing, but remember that the mission of a frame is to enclose, to limit, and that the matter is not well handled if this principle is absent.

It is impossible to make rules for other people in regard to the kind of pictures they should buy. To the person who admires *A Yard of Pansies* it is folly to recommend Botticelli's *Spring*; and the wisdom may be questioned of advising people to purchase what they do not like on the ground that it is what they ought to like or should be made to like. If certain pictures are an acquired taste it would be better to acquire the taste first and then the pictures. But whatever the choice may be, remember that the frame can add or detract immeasurably, and that no frame is satisfactory unless it is in harmony with the room in which it is placed.

THE SEVEN WONDERS OF THE ANCIENT WORLD

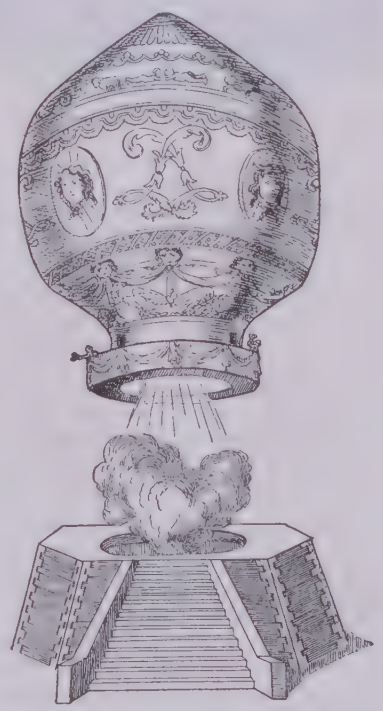
Copyright, 1931, by Educators Association

BOOK XV

USEFUL MISCELLANY

IN this department of Useful Miscellany will be found, arranged in alphabetical order, a series of articles that contain much useful and interesting information readily available for instant use and comparison. When a number of related subjects can well be grouped, for example: Bridges; National Parks; Organizations, a number of minor topics come together. Totally unrelated entries are entered alone. Cross references assist the student, and in addition, the general index will be found useful.

AERONAUTICS



The science of aeronautics, or navigation of the air, is now composed of many distinct branches. There is a growing tendency on the part of people to become acquainted with the facts and principles involved in the various phases of this subject and many, in order to obtain a more intimate knowledge of aeronautics, are studying it in detail. Wherever possible, this is done at some flying or ground school in order that practice and theory may be combined.

Ordinarily speaking, the vehicles in which navigation of the air is accomplished may be divided into two classes according to their principle of suspension: (1) the lighter-than-air type, as exemplified by balloons and airships, which are supported by gases lighter than the atmosphere, and (2) the heavier-than-air type, of which the airplane is the most common example, which depend for their support upon the dynamic reaction of the atmosphere under the moving surfaces. To this latter group belongs the hydroplane, which is an airplane designed to land and rise on water.

These various types of air vehicles provide a new mode of transportation. Men have traveled on and under the water; they have traveled on and under the land, and now they journey more swiftly above both land and water. The air is everywhere, and therefore the airplane, in particular, serves as a new mode of transportation on the most expansive of all highways.

Transportation is an ever-present problem of civilization, and every improvement in the means of transportation has brought about a marked advance in the intelligence and comfort of civilized peoples. Great has been the effect upon the life of America in the development of mechanical transportation on land and water, and greater still may be the ultimate effect of air transportation.

Early History of Flying. Undoubtedly the desire has always been in the mind and heart of man to have the wings of a bird and thus propel himself through the air. Ancient poets wrote of men flying through the clouds and their contemporary artists depicted these dreams on stones and parchment. All through the centuries legends have appeared, giving accounts of flights supposed to have taken place, and at the present time it is difficult to separate fact from fiction. It is related, for example, that Simon the Magician, early in the Christian era, manufactured a machine that resembled a fiery chariot and flew over Rome several times. He came to grief by falling into the Forum, breaking his neck. It is also related that Saracen of Constantinople,

Montgolfier Balloon

The fuel in the pit was set on fire, the bag was inflated, and the first practical balloon started on its journey. This flight took place in Annonay, France, in 1783.

equipping himself with a long flowing robe stiffened with rods, and leaning into the wind, jumped from the tower of the Hippodrome. He rose like a bird at first, then fell, killing himself.

Chroniclers of flights between this very early period and the year 1500 write with an appearance of simple fidelity, but modern scientific knowledge of aeronautics forces us to believe that the feats chronicled never were achieved. Had the flights been designated as "proposed," rather than "accomplished," these narratives would doubtless possess the accuracy they now lack.

Beginning with the sixteenth century, however, accounts of flights and men's experiments in aeronautics are well substantiated. From 1490 to 1500 Leonardo da Vinci made a study of aircraft from the engineer's point of view. He wrote a *Treatise on the Flight of Birds*, clearly indicating thereby his knowledge of the intricacy of the subject. His investigations, however, were not widespread. He made models that mechanically lifted themselves into the air without employing light gases. Da Vinci also made a helicopter, the vertical lift type of craft, and planned a parachute.

In the seventeenth century, Borelli, Lana and Robert Hooke are mentioned for their interest in air navigation. Besnier, a locksmith of Sable, around 1675 or 1680 made a glider and sold it to a traveling showman. Singularly, he did not have any imitators.

The early part of the eighteenth century was almost without experiment save for the flight which the Marquis of Bacqueville attempted across the Seine toward the Tuileries. Halfway across he fell on one of the many floats used by the Parisian laundresses and broke his leg. In the latter part of the century, however, a rather notable aeronautical discovery was made in the form of the Montgolfier balloon.

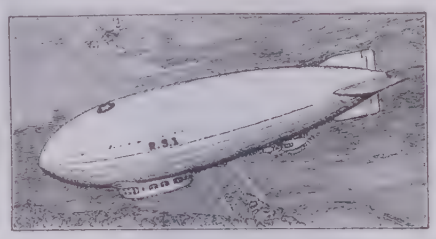
The Balloon. There lived in France two brothers, Stephen and Joseph Montgolfier by name. Manufacturers of paper by day, they amused themselves at night by filling paper bags with hot air and watching them rise to the ceiling—only to turn over, lose the heated air and fall to the floor. Soon, however, their attitude of amusement changed to one of seriousness, and they became desirous of devising a means of preventing the bags from turning over. One evening, after they had been nonplussed for a long time, the housewife entered the room and observed the experiments. Noting their difficulty, she suggested suspending from the bag a small pot containing fire. This they did, and found that not only was the bag thereby kept in a vertical position, but the means of maintaining a constant supply of hot air for the bag had been found. This was the genesis of the balloon, and the consequent division of aircraft into two parts: heavier- and lighter-than-air machines.

By June 5, 1783, the Montgolfier balloon had been perfected, and a crowd assembled at Annonay, a town close to Lyon, to see the first balloon flight. The fire pit was filled with wood, chopped wool and straw; around the top of the pit was a large wooden ring to support the fire pot; lying over the top of the pit and extending flat on the ground was the large bag. The torch was applied to the fuel; flames shot up into the air; the bag was inflated almost immediately; the men holding the ropes released them, and the first full-sized balloon started its journey! It sustained flight for several miles, and then descended only to be hurriedly hacked to pieces by neighboring peasants who thought it some monster from the skies.

Later Montgolfier balloon flights carried "passengers" of sheep, roosters and ducks to an altitude of 13,000 ft. In November, 1783, Pilâtre de Rozier defied the fears of the people and the unknown air and made the first authentic trip through the air in a balloon. Later in the same year, through the efforts of the Montgolfiers and a French chemist, Charles, the first hydrogen balloon made a successful flight.

In England, little was accomplished until the 1800's. Perhaps the outstanding student and writer on scientific lines was Cayley, who is called the "Father of British Aeronautics." He built a glider in 1809, but there is no record of his having flown in it. Thomas Walker was also an early student of flight but not a practical flyer.

In 1840, George Peacock (or Pocock) of Bristol made his "kite carriage." This vehicle, lifted by a huge kite, had been so improved that, by 1846, it sustained sixteen people in a flight from Bristol to London. Perhaps unknowingly Peacock demonstrated in this flight that air, moving against inclined plane surfaces, will provide sufficient lifting force to sustain the weight of a man.



The Dirigible. Up to this point in the history of aeronautics the free balloon had been most commonly employed as a means of transportation and an object of experimentation. This type, although it offered an unusual means of travel, was not satisfactory, for the voyagers of the air were at the mercy of the winds. The pilot could, of course, ascend or descend at will, but the direction of flight depended upon his ability in taking advantage of the winds that favored him.

Realizing this great deficiency, engineers and experimenters suggested and tried various means of meeting the situation. For example, in 1852, M. Gifford of Paris equipped an elongated balloon with a steam engine. In 1872, Dupey de Lome conceived the idea of driving a balloon by man power. Other inventors suspended steam engines or electric motors below the elongated bags, and in this manner provided the motive power which would permit of steering, making the balloon "dirigible."

Impressed by the qualities and regular working of the electric motor which had been used experimentally from time to time, Albert and Gaston Tissandier (or Tissandre) built, in 1883, a dirigible airship driven by an electric motor. After a preliminary trip in October, 1883, the balloon, in September, 1884, sailed for two hours at an independent speed of four meters per second. It was not able to go against the wind, but was able to complete numerous evolutions to the right or left of the direction of the latter. The Tissandier balloon was the first dirigible driven by electricity.

La France, constructed in 1884 by Captains Renard and Krebs of the French army, is the most prominent example of advance in experimentation. The propelling power was provided by an electric motor and heavy storage batteries. Fourteen and one-half miles an hour was the average speed obtained.

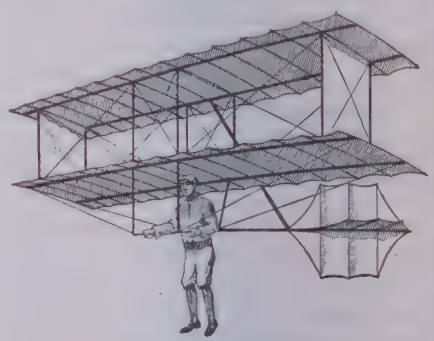
Before 1890 nearly all the experiments with dirigibles were made by simply adding a propelling device to an elongated gas bag, without providing means of stiffening the bag. This type was known as the "non-rigid," and to Santos-Dumont, a Brazilian, belongs the credit of bringing this type of airship to a practicable stage. From 1888 to 1901 he experimented, but not to his full satisfaction. However, on September 6, 1901, he completed the flight around the Eiffel Tower, covering 11 kilometers in 29 minutes, 30 seconds. His flight from the airdrome to his house in Paris on June 23, 1903, is remarkable because it necessitated travel between rows of buildings with a drag-rope trailing through the streets.

America's First Semi-rigid Airship
The *RS-1* represents an early type of American dirigible.

Count Ferdinand von Zeppelin of Germany was the most enthusiastic advocate of the "rigid" type of dirigible, although authorities do not agree that he should be credited with the original idea of the rigid airship. His first design was made in 1873, but it was received with so little consideration that Count Zeppelin resigned from the army in 1891 so that he could devote all of his time to the development of his invention. In 1898 a factory was built at Friedrichshafen, on Lake Constance, and from this emerged, on July 2, 1900, the first airship with rigid frame, that is, one with a strong framework inside the envelope. The Zeppelin type divides the interior into a number of compartments, each containing a gas bag. Von Zeppelin made three flights at a speed of 17.8 miles per hour. In 1905 the Z-2 made several flights, and in 1906 the third rigid ship made a flight of eight hours while traveling at a distance of over 200 miles at a maximum speed of 28 miles per hour. The Count, then sixty-eight years old, had given the world a new form of transportation.

One of the developments in America was the semi-rigid airship, *RS-1*, shown in the sketch on this page.

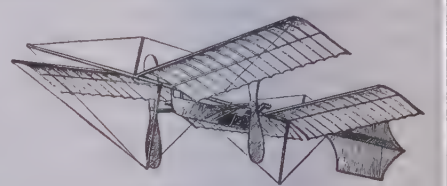
In 1916 the British constructed a number of small non-rigid airships known as "blimps" (from the official name, "B-limp"). They were used chiefly for reconnoitering during the World War.



The Airplane. The modern airplane with its broad wings that supply a flat surface to meet the resistance of the wind, is thrust forward by its motors and propellers, and the wind, rushing past, exerts a pull similar to that in a vacuum cleaner.

The period between 1840 and 1903 has well been called "the period of gliders," for the outstanding men in aeronautics during these fifty-three years believed in the principle that the first step toward making heavier-than-air machines practicable was to employ gliders experimentally in order that more knowledge of wing forms could be secured and to determine the effect of wind currents on the wings and control surfaces. The motors and propellers were a later development.

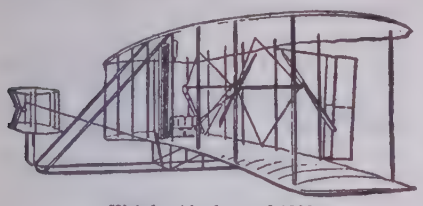
Stringfellow and Henson of England in 1842 built a model flying machine which quite closely resembled our early monoplanes. The model is credited in history as being the first self-propelled, self-driven, heavier-than-air machine to sustain itself in the air by its own generative power. Despite this fact Stringfellow became discouraged and, due to lack of financial assistance, stopped further experiments.



Two of the principal figures during this early time were the Lilienthal brothers of Germany; for they, about 1885-1889, discovered the flight possibilities of curved wings. Otto Lilienthal made many flights from a hill, gliding out over the valley for several hundred feet. He found, as had the Tissandier brothers before him, that he could steer either to the right or to the left. In testing a new horizontal steering arrangement he fell fifty feet and was killed. Fortunately, however, this great experimenter left a mass of valuable data for others to study.

Octave Chanute, of Chicago, forged the next link in the chain in departing from former practice by making the control surfaces of his glider movable. In 1895 he built five large machines of four different types.

Chanute Glider of 1895

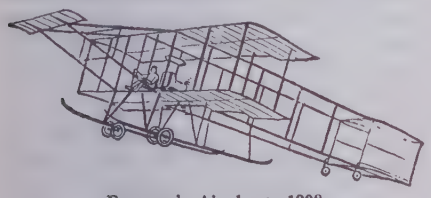


The first was a Lilienthal machine built by his able assistant, A. M. Herring. Chanute next built and tested a "multiple-winged" machine and then the "double deck" type which is now called a "biplane," with which several hundred flights were made around the sand dunes of Indiana near Gary.

Langley Tandem (side view)
Langley steam-driven aerodrome No. 5, immediately after its two flights of May 6, 1896, showing its condition after two descents from heights of nearly 100 feet, during each of which the aerodrome flew something over half a mile, descending in safety. (Drawing from official photograph, U. S. Army Corps. Description by same.)

In 1891 Dr. Samuel P. Langley, an American scientist of the Smithsonian Institution at Washington, began to build a flying machine. On May 6, 1896, in Washington, his power-driven airplane, or "aerodrome," flew for a little more than a minute and then

dropped down on the Potomac River. Langley's machine did not carry any passenger. During this same time Wilbur and Orville Wright, of Dayton, Ohio, achieved better practical results than Lilienthal, Chanute or Langley, and the early work of the Wright brothers is stamped indelibly upon present

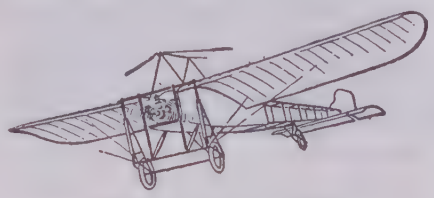


Wright Airplane of 1903
The plane that made the historic flight at Kitty Hawk, North Carolina.

day aircraft. The history of American invention contains no more fascinating story than that of the years of study and work by the Wright brothers preceding that memorable seventeenth of December, 1903, at Kitty Hawk, North Carolina, when, after trials, changes and disappointments without number, their airplane, fitted with a sixteen horse power four-cylinder gas motor and twin propellers, rose of its own power and carried Orville Wright on the first successful flight of any man. It was only for 12 seconds and a few hundred feet, but it electrified the world, and with good reason—man had learned to fly. The hope of centuries had become a reality.

The success of the Kitty Hawk flight led to further experiments, culminating on October 5, 1905, in a flight by the Wrights of 24½ miles, lasting 38 minutes at 38 miles an hour.

Airplane activity then seems to have been transferred to France for a time, where experiments were carried on by such pioneers as Santos Dumont of Brazil and the Frenchmen, Henri Farman, the Voisin brothers, Delagrange and Bleriot.



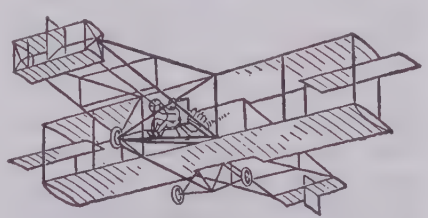
Farman's Airplane, 1908

Following closely the Wright brothers was Glenn H. Curtiss, the man who won the *Scientific American* Cup for the first preannounced public demonstration flight on July 4, 1908. In the year following, he put floats under the wings of an airplane and thus developed the first hydroplane to rise from and land on water. In 1909 he won the first Gordon Bennett Cup Race at a speed of 50 miles an hour.

As a comparison with present planes, it is interesting to record the specifications issued in 1907 by the U. S. Army for a flying machine of advanced type. It was required to carry two men, remain aloft one hour continuously, maintain an average speed of 40 miles an hour and be able to carry sufficient fuel for 125 miles of flying.

It was in connection with trial flights under these government specifications that Wright astounded the world by a flight over the Fort Myer drill ground lasting a trifle over an hour. Delays and difficulties attended the flights of this first government airplane, but on July 27, 1909, Wright again sailed triumphantly over Fort Myer field, this time for 1 hour, 12 minutes and 40 seconds, to the delight of 10,000 spectators, including President Taft and members of his cabinet.

At a meeting in Reims, France, in 1909, when aviators awed spectators by creeping cautiously to a height of 500 feet, it was confidently predicted that 1,000 feet was the greatest altitude possible; yet in 1910 Legagneux established a record of 10,747 feet. No sooner, in fact, did some timid prophet say a thing was impossible, than a courageous pilot proceeded to prove that it could be done.



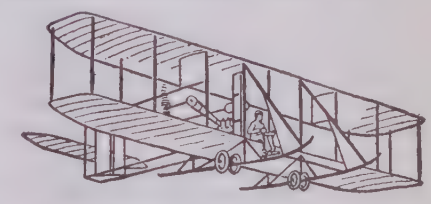
Bleriot's Monoplane, 1909

Bleriot, a Frenchman, in a machine built by himself, made the first "overseas flight" across the English Channel from Baraquas to Dover, at the same time giving a new type of airplane, the monoplane, its first real test.

The Modern Development of Aeronautics. From 1909 on, the development of aeronautics can best be pictured by a review of the outstanding events of each year. The recital of these events grows monotonous unless the reader keeps in mind that each one, at the time, was a courageous and glorious adventure. Constant development appears in the year-by-year proof of improved construction, increased skill in piloting, and growing confidence in man's right to fly.

At the close of 1909 world records had been established as follows: a cross-country flight of 40 miles in 1 hour and 3 minutes with a speed of 49.99 miles per hour and altitude of 1,486 feet; Henry Farman had made the first recorded flight with a passenger; Madame Piltier of France had demonstrated that women could fly; Wilbur Wright had circled the Statue of Liberty, and Count de Lambert had flown over the Eiffel Tower in Paris.

The year 1910 brought the first airplane exposition at Brussels, and a hundred organized meets and exhibitions in America, including that at Belmont Park with 29 aviators



Curtiss' Airplane of 1908

and 37 planes entered, 10 of which were once in the air at the same time. "Dips" and "spiral dives" and "banking" earned places in aviation language. Paulhan flew from London to Manchester in 12 hours. Curtiss flew from Albany to New York, 142½ miles, in 2 hours and 25 minutes at 50 miles an hour.

In 1911 the International Aviation Meet was held at Chicago, where from 10 to 15 airplanes could be seen in the air at one time. During the meet a new altitude record of 12,828 feet was made by Lincoln Beachey in a Curtiss pusher, an airplane with the propellers at the rear of the supporting surfaces. Shortly following this great aviation meet, C. P. Rogers made the first American coast-to-coast flight, starting from Sheepshead Bay, New York, September 17, and landing on November 5 at Los Angeles. The first air mail in the United States was from Nassau Boulevard Airdrome, L. I., to Mineola, L. I.; Ely demonstrated that an airplane could rise from a battleship; McCurdy flew from Key West, Florida, to Cuba; Beachey dipped over Niagara Falls and flew through the gorge; Prier of France made the first non-stop flight from London to Paris, 250 miles in about 4 hours.

The year 1913 brought reports of Sikorsky, a Russian, flying with seven passengers, thus again showing the possibilities of the airplane as a common carrier. An American flew over the Panama Canal. A statement in the House of Representatives that "five years ago no one would fly in a wind blowing five miles, but today (1913) flying is done in puffy winds of forty to forty-five miles per hour" was immediately proved by a pilot flying in a

Wright Airplane of 1910

50-mile wind. The same year contributed a non-stop flight from Paris to Berlin; and one of 930 miles from Paris to Warsaw in 11 hours. Two American pilots flew from Chicago to Detroit by way of the Great Lakes, a distance of 900 miles. M. Pegoud in France made the first intentional "loop the loop" in an airplane.

Previous records were shattered in 1914; altitude now stood at 26,246 feet; speed at 126.66 miles per hour; duration at 21 hours, 38 minutes and 48 seconds. Parmelee, an American pilot, flew over Mont Blanc, and Silas Christofersen flew 1,000 feet over the peak of Mt. Whitney in California. Garaix, a French pilot, established a world record by carrying 3 passengers for 4 hours, 3 minutes and 29 seconds; and W. C. Robinson of Grinnell, Iowa, in a monoplane built by himself, broke the American cross-country record.

During the next four years, with the World War going on in Europe, aviation passed largely from record breaking and cup racing to more grim pursuits, bringing radical changes in the design of planes, and adding heroes of a new type to history's roll.

A few outstanding peace events also claimed attention: a flight by Victor Carlstrom, Chicago to New York, with two stops, actual flying time 8 hours, 28 minutes: a

non-stop flight of 590 miles by Ruth Law in 8 hours, 55¾ minutes.

Curtiss' Airplane of 1916

In 1918 a world altitude record of 28,900 feet was made by Maj. R. W. Schroeder, U. S. A. The first regular air mail service in the world was established between New York and Washington.

Building on the great progress made during the World War and with energy released from the strain of war, 1919 witnessed some remarkable achievements. First moves were made toward municipal air fields; small passenger-carrying companies sprang up over the country; the carrying of air mail increased and exhibition flights again claimed attention. The first speed and handicap race was held between New York and Toronto. Fifty-two planes entered and 32 finished. The first transatlantic flight, Newfoundland to Portugal by way of the Azores was made by Lieut. Com. A. C. Read, U. S. N., in the *NC-4*.

The following year, 1920, was marked by a number of notable flights: the first non-stop flight across the Atlantic from St. Johns, Newfoundland, to Clifton, Ireland, by John Alcock and A. W. Brown of England; a non-stop flight from Paris to Morocco; a flight from Buenos Aires to Valparaiso, Chile; the first non-stop flight from Chicago to New York, 727 miles, by Capt. Earl White; a flight over the Andes Mountains by Lieut. Cortinez; a flight from London to Darwin, Australia, 11,500 miles, between November twelfth and December tenth, by Capt. Ross Smith. A U. S. Navy plane was launched from a flying dirigible.

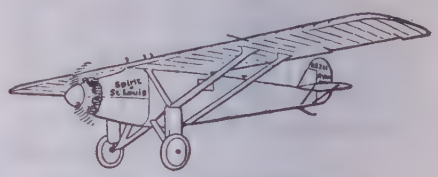
In 1920, Maj. Schroeder made a new altitude record of 33,113 feet. A new speed record of 194 miles per hour was made. Four planes made a successful trip from New York to Nome, Alaska, and return—9,000 miles in 112 flying hours. The transcontinental mail route, New York to San Francisco, was inaugurated.

The next two years were comparatively quiet ones, but included an altitude record of 34,507 feet by John A. Macready. The air mail from San Francisco to New York established a new time record of 33 hours and 20 minutes; Lieut. Doolittle flew from Jacksonville, Florida, to San Diego; Lieuts. Kelly and Macready made a non-stop flight from San Diego to Fort Benjamin Harrison, Indiana, a distance of 2,060 miles; two Portuguese flyers flew from Portugal to Brazil, a total of 3,490 miles; Sir Alan Cobham made tours covering 8,000 miles in Europe and flew from Belgrade to London in a day.

In 1923 the air mail, now five years old, had five routes in operation, with the planes flying 1,589,389 miles during the year. Lieut. Rittenhouse, U. S. N., won the International Seaplane Race off the Isle of Wight; Lieuts. Kelly and Macready of the air service made another non-stop record flight from the Atlantic to the Pacific Coast in 26 hours, 50 minutes and 38 seconds.

In the history of American aeronautics, the flights and fate of the *ZR-1*, better known as the *Shenandoah* (an Indian name, meaning "Daughter of the Stars"), are indelibly written. On September 4, 1923, at the Naval Air Station at Lakehurst, N. J., this navy rigid airship made her first flight. The flight inaugurated a new epoch in the science of air transportation, for it was the first time in the history of aviation that a rigid ship had flown when inflated with the non-inflammable gas, helium. The first flight was of about an hour's duration, covering a distance of 20 miles each way. The big craft did not attempt to travel over 35 miles an hour, nor at a higher altitude than about 1,100 feet. Thirty men constituted the crew and 15,000 people witnessed the flight. It took two years to build this 30-ton ship, and the cost was $2,000,000.

Two years after the *Shenandoah* was launched, it started out on its fatal trip to the Middle West. On the night of September 3, 1925, manned by a crew under Commander Lansdowne, it encountered a terrific storm in Ohio, and the first American airship, built for the navy to use in time of war, fell to the earth—a mass of wreckage.



The *Los Angeles*, formerly the *ZR-3*, another famous American airship, was built in Germany as a part of the agreement made with the United States by Germany at the close of the World War. It arrived in this country in 1924, a year after the *Shenandoah* was launched, and shared the big hangar with her sister ship. The *Los Angeles*, still in service (1931), is equipped with all modern conveniences, for it was built to carry passengers, not guns.

World interest at the beginning of 1924 centered on the attempt of the Army Air Service to fly around the world. Four planes left Seattle on April 6, and on September 28 two of them finished the 27,534-mile trip. There were 65 days of actual flying time at an average speed of 76.36 miles per hour. This year also saw the first dawn-to-dusk American transcontinental flight—2,645 miles in 21 hours, 48 minutes—by Lieut. Russell Maughan.

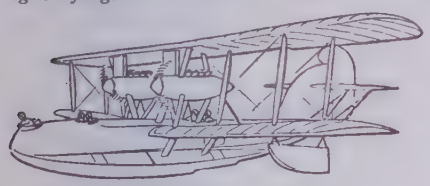
In 1925 occurred the first of many attempts to fly across the Pacific Ocean when the naval plane *PN-9, No. 1*, made a brave but unsuccessful attempt to fly to Hawaii. A new non-stop record was established by French aviators of 2,732 miles in 45 hours and 12 minutes; Sir Alan Cobham flew from London to Rangoon and back, and also to Cape Town and back to London; MacMillan put airplanes to new use in his exploration of the Arctic. In 1925 the air mail planes flew a total of 2,076,764 miles, carrying 9,300,520 letters.

The year 1926 marked the opening of many new air mail routes operated by private capital. Commander Richard E. Byrd and Floyd Bennett flew from Svalbard (Spitsbergen) to the North Pole and back in 15 hours, to be followed a few days later by Captain Roald Amundsen, whose dirigible flew from Svalbard to Teller, Alaska, 2,700 miles, over the top of the world. French airmen made a non-stop flight from Paris to Jask, Persia, 3,313 miles; U. S. Army airplanes made a good-will flight around Latin America, covering 20,000 miles; and the altitude record moved up to 37,569 feet.

Lindbergh's Transatlantic Flight. Lindbergh inaugurated the historic airplane year of 1927. The world suddenly became acutely air-minded when the unknown air mail pilot took off one day from San Diego, broke the record to St. Louis, then flew to New York, and, in his own good time, flew out over the Atlantic and in 33 hours, 30 minutes landed

Lindbergh's *Spirit of St. Louis*

The Ryan monoplane in which Lindbergh made his historic flight from New York to Paris in 1927.



in Paris. It may be said that American and, indeed, world aviation had a new birth with Lindbergh's memorable flight. His supreme confidence was contagious.

There followed with breath-taking rapidity a series of exploits that only a few years before would have been pronounced incredible. They include Commander Byrd's transatlantic flight to the north coast of France, 3,477 miles in 42 hours and 6 minutes; Clarence Chamberlain's flight to Germany, 3,905 miles in 42 hours and 45 minutes, thus establishing a new distance record; the first successful flight to Hawaii by Lieuts. Maitland and Hegenberger, 2,407 miles; Smith and Bronte's flight to Hawaii in a small monoplane; the race to Hawaii, won by Goebel and Davis in 25 hours, 17 minutes; a flight by Chamberlain from the ocean liner, Leviathan, 120 miles out from New York; Lindbergh's tour of the United States, 22,350 miles, visiting all the States, 82 cities, and, in every instance except one, arriving at his destination on schedule time; Lindbergh's non-stop flight to Mexico City and his good-will tour of Latin America, covering 7,860 miles in 101 flying hours; the second Arctic expedition by Sir Hubert Wilkins; a new endurance record by the German flyers, Risticz and Edzard of 52 hours, 23 minutes and 11 seconds; a new altitude record by Champion of 38,474 feet; the Newfoundland-to-Japan flight by Brock and Schlee; and the round-the-world tour of the French pilots, Coste and LeBrix. During the winter of 1927-28, Sir Alan Cobham flew all around Africa in a seaplane, laying out the African through-route for airplanes.

Aeronautical courses were established in educational institutions; the air express service was inaugurated, and the air mail counted 11,446 miles of routes in operation with an authorized 8,000,000 miles of flying. And to this practical everyday demonstration of flying by the air mail pilots, aviation owes a great debt.

Great as were the 1927 accomplishments, 1928 saw some of them eclipsed. There was a new distance record of 4,763 miles, and a duration record of 65 hours and 25 minutes. The year brought the first westward flight over the North Atlantic by the monoplane *Bremen*, from Dublin to Greenly Island, north of Newfoundland; a non-stop flight from Point Barrow, Alaska, to Spitsbergen, by

Capt. Wilkins and his pilot, C. B. Eielson; Miss Amelia Earhart, in the *Friendship* piloted by Stultz and Gordon, was the first woman to negotiate a successful transatlantic flight; the *Southern Cross*, with Capt. Kingsford-Smith and three companions, made the memorable flight from Oakland, California, across the Pacific to Australia—the longest over-water flight ever made; Goebel flew eastward across the United States in 18 hours and 58 minutes; Bert Hassel, in the *Greater Rockford*, flew from Rockford, Illinois, to Greenland; a speed record of 319 miles per hour made by an English pilot, and a successful flight across the English Channel by an autogyro or "windmill" plane. This type, incidentally, holds an interesting promise for the future. Development of the airplane along commercial lines was even more marked. The production of airplanes in 1928 was two and one-half times that of the preceding year. Airplane time-tables became a commonplace, and 13,000 miles of airways were lighted for night flying.

Navy Hydroplane of 1928

In 1929 there was great progress in air travel, with 125,000,000 miles covered and 3,500,000 passengers carried. This development was brought about by the improvement in large transport airplanes, navigation equipment, fog flying instruments, radio beacons and weather reports by radio. The establishment of new airports everywhere did much to afford facilities for the owner of an aircraft. In the United States about 7,000 airplanes were sold during the year. About 600 flying training schools were opened, pilots numbered about 10,000 of whom 7,000 were licensed by the U. S. Department of Commerce.

Around the World by Airship. In 1929 the giant German airship, *Graf Zeppelin*, made the first round-the-world flight of a lighter-than-air craft. The qualities of the ship had been amply proved during the round trip flight across the Atlantic in the previous year. The world flight began at Friedrichshafen, Germany, on July 31 and ended at the same place on September 4, the total mileage being 21,238. The ship was commanded by Dr. Hugo Eckener, although he remained at Lakehurst, N. J., on the return flight, leaving the ship to be piloted to its home hangar by Capt. Ernest Lehman, second in command.

Practical application of commercial aviation got well under way. For instance, refueling an airplane in midair was well demonstrated by Jackson and O'Brine during a 420 hour endurance flight in a Curtiss *Robin*.

The experimental "blind flying" tests by Lieut. James Doolittle, in which he made a flight entirely by instruments without seeing either land or sky, was an accomplishment well worth while.

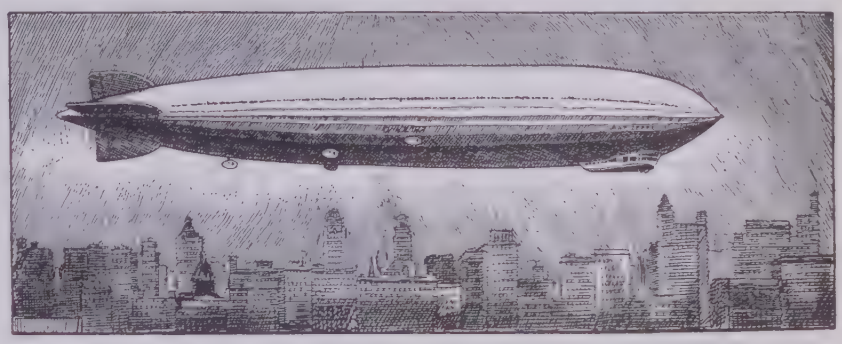
The South Pole by Airplane. The Byrd expedition to the South Pole was an outstanding event. After many scientific explorations with Little America as a base, the successful flight to the South Pole was accomplished on November 29, 1929. With Admiral Byrd were Bernt Balchen as pilot, Capt. Ashley McKinley as aerial surveyor, and Harold I. June as radio operator.

Transatlantic flights again were in evidence. Williams and Yancey flew from America to Rome, Italy. Assolant, a Frenchman, flew from Maine to Spain. The South Atlantic was crossed twice, by Jiminez and Iglesias and shortly thereafter by Larre-Borges and Challe. The world's record for speed made by the British pilot Orlebar, jumped to 357.7 miles an hour. The world's altitude record was raised to 41,794 feet by Neuenhofen in Germany. Capt. Hawks made a flight from New York to California and return in 36 hours and 48 minutes. The year came to a close with the winning by the Curtiss *Tanager* of the $100,000 prize for the Safe Airplane Competition sponsored by the Guggenheim Foundation for Aeronautics.

The year 1930 was memorable in aeronautics. After a series of flights started more than a year previously, Wing-Commander Charles Kingsford-Smith, of Australia, completed a world flight in the airplane *Southern Cross*.

In July, the British dirigible *R-100* crossed from England to Montreal, Canada, in 72 hours. A few days later the big ship flew back to England. In October, a sister ship, the *R-101*, a few hours after starting on a flight to India encountered a storm in France and crashed, destroying the ship and killing most of the passengers and crew.

In July and August, O'Brine and Jackson of St. Louis in the airplane *Robin* set a duration flight record of 647 hours, 28½ minutes, thus breaking a duration record set a few weeks earlier by the Hunter brothers of Chicago.



In August, Capt. Wolfgang von Gronau made an unheralded flight from Germany to New York, stopping at the Faroe Islands, Iceland, Greenland and Nova Scotia.

In August, Capt. Frank Hawks made two transcontinental records: a flight from New York City to Los Angeles in 14 hours, 50 minutes; and a return flight over the same course in 12 hours, 25 minutes, 3 seconds.

In September, Coste and Bellonte, of France, in the red airplane *Question Mark*, made the first non-stop flight from Paris to New York City in 37 hours, 18½ minutes.

In November, Capt. Roy W. Ammel landed at France Field, Balboa, Canal Zone, having flown 3,189 miles from Brooklyn, N. Y. to the Panama Canal in 24 hours, 35 minutes, the first solo non-stop flight between these points.

A striking development of 1930 was that of a large parachute capable of supporting an entire airplane. Successful tests made with a Park biplane indicated important possibilities in the parachute adding to the confidence of the traveling public.

The *Graf Zeppelin*

A notable event of 1929 was the circumnavigation of the globe by the German airship, *Graf Zeppelin*. In many flights this great ship has proved herself.

Early in 1931 the 6,500,000 cubic-foot navy dirigible *Akron* was completed. This American-built ship, if stood on end, would be as high as an 80-story building.

Looking back over the record to 1903, the greatest distance covered in that year by an airplane was 852 feet—about one-sixth of a mile; in 1930 an airplane made a 5,088-mile non-stop record. In 1903 the duration record was 12 seconds; in 1930 it was 647 hours, 28½ minutes. In 1903 the speed record was 25 miles per hour; in 1930 it was 357.7 miles per hour. In 1903 the altitude record was 27 feet; in 1930 it was 43,166 feet. And the achievement record of aeronautics is being written every day.

The present trend is toward larger airplanes. The Junkers, in Germany, and the Fokker, in America, each carry 32 passengers and heavy additional loads of freight and mail. The Commodore flying boats, of America, carry 20 passengers. The Italian Caproni 90 P.B., a great land plane fitted for use as a bomber, could also be used as a passenger plane carrying approximately 100 persons. The great flying boat of Germany, the Dornier Do-X, with a capacity of about 112 persons, has carried as many as 169 persons on a flight.

Safety of air travel is engaging much attention. The National Advisory Committee for Aeronautics has entered upon a study of the causes of "spinning," in an attempt to reduce this danger. The Department of Commerce licenses airlines and grants licenses only to those showing satisfactory personnel and equipment. Radio is a great factor in safety in flying. The Bureau of Standards has worked out a system of radio beacons and is studying the problem of landing in a fog. A Diesel type of engine allows the burning of a heavy fuel oil and is reducing the fire hazard. The licensing of schools, pilots and mechanics generally is improving the operation of aircraft.

AIR

Air is the gaseous substance which fills the atmosphere surrounding our planet. It is elastic, and is destitute of taste, color and smell. It contains by weight: oxygen 23.10 parts, and nitrogen 76.90; and by volume: oxygen 20.90, and nitrogen 79.10; or of 10,000 parts there are in perfectly dry air: nitrogen 7,912, oxygen 2,080, carbonic acid 4, carbureted hydrogen 4, with a trace of ammonia. But air never is dry; it has always in it a varying amount of water vapor. When exhaled from the lungs it is saturated with moisture, and contains about 4.35 parts of carbonic acid. The prevalence of this latter gas in abnormal quantity is prejudicial to human life, while air with a high percentage of oxygen in it is healthful and invigorating.

The density of air being fixed at the round number 1,000, it is made the standard with which the specific gravity of other substances is compared. If water be made unity, then the specific gravity of dry air is .0012759. At 62 degrees Fahrenheit it is 810 times lighter than water, and 11,000 times lighter than mercury. At the surface of the sea the mean pressure is sufficient to balance a column of mercury 30 inches, or one of water 34 feet in height.

The exact height of the atmosphere is unknown. At 2.7 miles above the surface of the earth half its density is gone, and the remainder is again halved for every further rise of 2.7 miles. Some small density would remain at 45 miles high. At 80 miles this would have all but disappeared. But from sundry observations, made at Rio de Janeiro and elsewhere, on the twilight arc, it has been estimated that the extreme limit of the atmosphere is between 198 and 212 miles. In the lower strata of the atmosphere the temperature falls at least a degree for every 352 feet of ascent; hence, even in the tropics, mountains of any considerable elevation are snowcapped. The atmosphere appears to us blue, because absorbing the red and yellow solar rays, it reflects the blue ones. It revolves with the earth, but being extremely mobile, winds are generated in it, so that it is rarely long at rest.

AIR BRAKE

In 1869, George Westinghouse Jr. invented the air brake whereby the brakes are forced against the wheels of a railroad car by means of compressed air. This has been a marvelous invention for the railroad since it gives the engineer complete control of the train at all times and enables him to make a stop in far shorter time than with old-style brakes.

The air brake is so arranged that to release the brakes the system must be in good order. When the machinery gets out of order the compressed air which holds the brake away from the wheel ceases to function and the train is automatically stopped.

ALMIGHTY DOLLAR

In this phrase, coined by Washington Irving, we have a personification of the supposed object of American worship. It is intended as a satire on the mad race for wealth that has at different times and in divers places characterized the American people.

AMERICAN RHINE

The Hudson River, "unrivaled among American rivers for picturesque and magnificent scenery." Though destitute of the numerous architectural remains of bygone ages that crowd with interesting reminiscences the banks of its Old World namesake, the Hudson is equally enriched by nature, and is not without its share of legendary lore.

AMERICA'S CUP RACE

In 1851 the yacht *America*, owned by Commodore Stevens of the New York Yacht Club, beat all entries in a race around the Isle of Wight and was awarded the prize cup. Hence this famous competition has since been called the America's Cup Race. Many of these races have since been held between English and American ships. Since 1899 Sir Thomas Lipton has built boats and attempted to capture this famous race for England. His sailing vessels were named *Shamrock I, II, III, IV*, and *V* respectively. Including the 1930 race he lost five times.

ANATOMY AND PHYSIOLOGY, UNIQUE ITEMS ABOUT

The following items concerning human anatomy and physiology have been gathered from a number of authentic sources:

Blood. An adult has ordinarily 28 pounds of blood; at each pulsation of the heart, 10 pounds are sent through the arteries and veins. The pulsations average 120 per minute in infancy, 80 in manhood, and 60 in old age, and are rather more rapid in women than in men.

Temperature of the Human Blood.

Good health	98.6 (Fahrenheit).
Fever	101.3 (Fahrenheit).
Strong fever (morning)	102.2 (Fahrenheit).
Strong fever (evening)	104.0 (Fahrenheit).

Brain. According to Bastian and others, the following brain weights are given of different nationalities:

Scotch	50.0 oz.
Germans	49.6 oz.
English	49.5 oz.
French	47.9 oz.
Zulus	47.5 oz.
Chinese	47.2 oz.
Italians	46.9 cz.
Hindus	45.1 oz.
Gypsies	44.8 oz.
Bushmen	44.6 oz.
Eskimos	43.9 oz.

Capacity of Brain-Case.

Anglo-Saxon	105 cu. in.
German	105 cu. in.
Negro	96 cu. in.
Ancient Egyptian	58 cu. in.
Hottentot	58 cu. in.

Brain Weights. The average weight of the human brain, as given by Quain, is 49½ ounces avoirdupois for males, and 44 ounces for females. This general result was obtained by comparing and combining the tables prepared by Sims, Clendinning, Tiedemann and Reid. The number of male brains weighed was 278, and of female brains, 191. In males, the minimum weight was 34 ounces, and the maximum, 65 ounces. In females, the minimum weight was 31 ounces, and the maximum, 56 ounces. In new-born infants, the brain weighs about 11.65 ounces for the male, and 10 ounces for the female.

In both sexes, the weight of the brain generally increases rapidly up to the seventh year, then more slowly to between 31 and 40, at which time it reaches its maximum point. Beyond that period, there appears a slow but progressive diminution in weight of about one ounce during each subsequent decennial period; thus confirming the opinion that the brain diminishes in advanced life.

Bricklayer, aged 38; fair intelligence, but could neither read nor write (reported by Dr. James Morris)	67.00 oz.
Cuvier, aged 63 (Archives generales de medecine, 1832)	64.33 oz.
Abercrombie, aged 63 (reported by Dr. Adam Hunter)	63.00 oz.
Congenital epileptic idiot (reported by Dr. Tuke)	60.00 oz.
Ruloff, aged 53; above medium stature; executed for murder in 1871; well versed in languages, imagining that he had discovered new and important principles in philology (reported by Dr. George Burr)	59.00 oz.
James Fisk, Jr., killed in New York, in 1872; illiterate, but said to possess great executive ability; notorious for colossal and unscrupulous financial speculations (reported by Dr. Marsh)	58.00 oz.
Spurzheim (Medico-Chirurgical Review, 1836)	55.06 oz.
Adult man; an idiot since two years of age (Wagner)	54.95 oz.
Daniel Webster, aged 70 (reported by Dr. John Jeffries)	53.50 oz.
Executed criminal, aged 45; medium stature; of less than ordinary intelligence, and uncultivated (Lelut)	53.12 oz.
Dupuytren, aged 58 (Cruveilhier, Husson, and Bouillaud)	49.68 oz.
Day-laborer, aged 49 (Wagner)	48.85 oz.
Celebrated philologist, aged 54; 5 feet 7½ inches tall (Wagner)	47.90 oz.
Executed criminal, aged 34; small stature; intelligence developed and cultivated (Lelut)	47.79 oz.
Celebrated mineralogist, aged 77; above medium stature (Wagner)	43.24 oz.
Man, 44 years of age; idiocy very profound; a little below medium stature (Lelut)	34.39 oz.

A careful study of the weights given in this table shows the impossibility of applying to individuals an absolute rule that the greatest brain-power is connected with the greatest amount of brain-substance.

Chemical Composition of Man. Huxley's table on the "Chemical composition of man of the average weight of 154 pounds" was for years the standard, but it has been superseded by the appended one that was authorized by the French Academy of Sciences.

Elements	*Pounds*	*Ounces*	*Grains*
Oxygen	111	8	0
Hydrogen	21	6	0
Carbon	21	0	0
Nitrogen	3	10	0
Phosphorus	1	2	88
Calcium	2	0	0
Sulphur	0	0	219
Chlorine	0	2	47
Sodium (Salt)	0	2	116
Iron	0	0	100
Potassium	0	0	290
Magnesium	0	0	12
Silica	0	0	2

Coughing. We cough because the respiratory organs are excited by the presence of some body foreign or unnatural to them. A cough is an effort on the part of the air tubes to free themselves from some source of irritation. And so important are the organs of breathing to the welfare of the body, that the muscles of the chest, back, and abdomen unite in the endeavor to get rid of the exciting substance.

Freckles. The action of the sun's rays on certain kinds of skin causes small parts of the second layer to give out a yellowish brown pigment. Persons of fair complexion and hair generally are more subject to freckles. Other people, because of a different kind of skin, do not freckle, regardless of exposure to the sun. Though some freckles are permanent, in most cases cold weather causes them to disappear.

Hair. The number of hairs on an adult's head averages from 129,000 to 150,000. A healthy scalp has a certain amount of natural oil that lubricates.

Hiccough is caused by a spasmodic twitching of the diaphragm, a thin muscular membrane which divides the chest from the abdomen. It generally arises from sympathy with the stomach; and it is highly probable that the muscular twitches and jerks are so many efforts on the part of the diaphragm to assist the stomach to get rid of some undigested matter.

Laughter. Laughing is caused by influences the very opposite of those that produce sighing. The nervous system is highly excited by some external cause. The impression is so intense, and the mind so fixed upon it, that the respiratory process is irregular, and uncontrolled. Persons excited to a fit of laughter generally hold their breath until they can hold it no longer, and then suddenly there is a quick expiration causing eccentric sounds, the mind being too intently fixed upon the cause of excitement either to moderate the sounds or to control the breathing.

Pulse. The beat or shock felt in an artery when slight pressure is made on it, caused by the systole of the heart. At birth the number of beats are about 140, at the end of the first year 120, at the end of the second 110; during middle life between 70 and 80, and in old age usually a little more. It is slower in man than in woman, and is also affected by the position of the body, being about five beats more in the sitting than in the recumbent posture, and 10 more per minute the standing than in the sitting posture.

Correlation of Pulse and Temperature. As a general rule the correlation of pulse and temperature may be stated as follows:

An increase of temperature of one degree above 98 degrees Fahrenheit corresponds with an increase of 10 beats of the pulse per minute, as in the following table:

Temperature of 98° corresponds with a pulse of 60.
Temperature of 99° corresponds with a pulse of 70.
Temperature of 100° corresponds with a pulse of 80.
Temperature of 101° corresponds with a pulse of 90.
Temperature of 102° corresponds with a pulse of 100.
Temperature of 103° corresponds with a pulse of 110.
Temperature of 104° corresponds with a pulse of 120.
Temperature of 105° corresponds with a pulse of 130.
Temperature of 106° corresponds with a pulse of 140.

Respiration. Respiration is the act of inhaling air into the lungs, and again expelling it. The quantity of carbonic acid gas exhaled in 24 hours is as follows:

Person	*Age*	*Ounces Exhaled*
Girl	10	9
Boy	10	10
Young woman	19	12
Young man	16	16
Man	28	17

Sighing. The action of sighing arises from very similar causes to those of yawning. But in sighing, the nervous depression is caused by *grief*; while in yawning, it is the result of *fatigue*. In sighing, the effect is generally caused by an *expiration*—in yawning by an *inspiration*. The mind, wearied and weakened by sorrow, omits for a few seconds to continue the respiratory process; and then suddenly there comes an involuntary expiration of the breath, causing a faint sound as it passes the organs of the voice.

Sleep is understood to be that state of the body in which the relation of the brain to some parts of the body is temporarily suspended. There are some parts of the body that never sleep; such are the heart, the lungs, the organs of circulation, and those parts of the nervous system that direct their operations.

But when sleep overtakes the system, it seems as if the relations of those parts under the control of the will were temporarily suspended; as if, for instance, those nerves which move the arms, the legs, the eyes, the tongue, were all at once unfastened, just as the strings of an instrument are relaxed by the turning of a key, or the throwing down of a bridge over which they were stretched.

What is meant by the suspension of the relation of the brain to some parts of the body, may be thus explained. Notice a man when he sits dozing in a chair; at first his head is held up, the brain controlling the muscles of the neck, and keeping the head erect. But drowsiness comes on, the brain begins to withdraw its influence, and the muscles of the neck becoming as it were "unstrung," the head drops down upon the breast. But the sleep is unsound, and disturbed by surrounding noises. The brain is therefore frequently excited to return its influence to the muscles, and draw up the head of the sleeper. He gives a sudden start, every muscle is tightened in an instant, up goes the head, the eyes open, the ears listen, until a feeling of security and composure returns; the sleep again deepens, the nervous connection is again withdrawn, and then down drops the head as before.

Sneezing. We sneeze because particles of matter enter the nostrils and excite the nerves of feeling and of smell. In sneezing, as in coughing, the effort is to free the parts affected from the intrusion of some matters of an objectionable nature. And in this case, as in the former one, there is a very general sympathy of other organs with the part affected, and an energetic effort to get rid of the evil.

Snoring is caused by air sweeping through the passages that lead from the mouth through the nostrils, and which, in our waking moments, are capable of certain muscular modifications to adapt them to our breathing. But as in sleeping, the nervous control over them is withdrawn, they are left to the action of the air which, in sweeping by them, sets them in vibration.

Tears. Tears are salty because salt when properly mixed with water makes a perfect wash for the eyes and nature makes the proper solution.

Yawning and Stretching. When we are bored or sleepy or tired, we do not breathe as deeply as we should and our blood does not receive enough oxygen from the air. When our brain learns that there is insufficient oxygen in our blood, it orders us to take a great deep breath, or to stretch, or both. This great big breath is called a yawn. Thus yawning and stretching are real helps to the body. It is not considered polite to yawn or stretch in front of another person because that implies that one is tired of the other person's company.

APOSTLES, FATE OF

It is generally believed that only one of Christ's Apostles, John, escaped martyrdom. Matthew is supposed to have been slain with a sword in Ethiopia. James, son of Zebedee, was beheaded at Jerusalem. James, the Less, son of Alpheus, was thrown from a pinnacle of the Temple and then beaten to death with a fuller's club. Philip was hanged up against a pillar at Hieropolis, a city of Phrygia. Bartholomew was flayed alive at Albanapolis, in Armenia. Andrew suffered martyrdom on a cross at Patræ, in Achaia. Thomas was run through the body with a lance at Coromandel, in the East Indies. Thaddeus was shot to death with arrows. Simon Zelotes was crucified in Persia. Peter was crucified, head downward it is said, during the Neronian persecution. Matthias was first stoned and then beheaded, and Paul was beheaded at Rome by the tyrant Nero. Judas Iscariot, after the betrayal of our Lord, hung himself.

APRIL FOOL'S DAY

The origin of the custom of April fooling cannot be traced with any degree of certainty. The first reference to it in English literature is in 1687, in Congreve's *Old Bachelor*, 1, IV, "That's one of Love's April-fools, is always upon some errand that's to no purpose." In the literature of the eighteenth century there are found many references to it. One suggestion is that the custom of playing tricks on the first day of April was derived from some ancient pagan custom, such as the Huli festival among the Hindus, or the Roman Feast of the Fools. One fact, however, we do know, and that is that the practice prevails in many countries, under various names, which would seem to indicate that it dates back to the early history of the race. There is a tradition among the Jews that the custom of making fools on the first of April arose from the fact that Noah sent out the dove on the first of the month corresponding to our April, before the water had abated. To perpetuate the memory of the great deliverance of Noah and his family, it was customary on this anniversary to punish persons who had forgotten the remarkable circumstance connected with the date, by sending them on some bootless errand similar to that on which the patriarch sent the luckless bird from the windows of the ark.

ASHES

When a tree grows it takes up from the earth, by means of its roots, certain minerals called "salts." These salts, which all plants need as much as they do air, become a part of the wood of the tree. When a stick of wood is burned, most of it is turned into gas, and goes off into the air. All that is left is the ashes, which cannot burn, as they are the salts which the tree took up from the earth when growing. If the ashes be spread over the ground, the salts will go back into the earth again, and this is the reason why wood ashes make good manure for land: the salts which have been taken from it by growing plants are given back to it in the ashes, and help other trees and plants to grow. Some kinds of wood give more ashes when burned than others. Willow gives more than twice as much as oak, and about one-fourth more than elm. The bark of all trees makes more ashes than the solid wood. The salts found in ashes are valuable and are much used in the arts.

ASTRAL SPIRITS

According to the mythology of the Persians, Greeks and Jews, each star had its special spirit, which may be termed its soul, or vital principle. Paracelsus maintained that every man had his attendant star, which received him at death, and took charge of him till the great resurrection.

ASTROLOGY

A term originally applied to the science of the heavenly bodies and their supposed influence over human affairs. At the present day, however, the word is limited in its meaning to the doctrine of the influence of the stars over the destinies of men. Astrology is one of the oldest of superstitions, and has been sedulously cultivated by the Egyptians, Chaldæans, Hindus, Chinese and Etruscans. The Arabs also pursued the study with great zeal from the seventh to the thirteenth century, and it was in great vogue in Italy and France during the sixteenth century. In England it was cultivated by Bede (673-745) and Roger Bacon (1214-1292). Queen Elizabeth (1558-1603) was a dupe of the astrologer Dee, and Lord Burleigh is said to have calculated the nativity of the "Virgin Queen." Sir William Lilly was frequently consulted by Charles I (1625-1649). Nostradamus was the great astrologer of the sixteenth century, after which time this pseudo-science failed to attract superior minds. The discoveries of Copernicus, Kepler and Galileo were death-blows to astrology, which, however, continues to attract believers even at the present day. Astrological almanacs are still published, and fortune-tellers still drive a thriving trade among the ignorant and superstitious. (See also **Character by the Month.**)

AURORA BOREALIS

The aurora polaris is a phenomenon of the atmosphere called *aurora borealis* in the northern hemisphere. These northern lights are the bright clouds of light which are often seen in the northern sky in the night. *Aurora* is a Latin word meaning "the light of the morning," and *borealis*, also Latin, means "northern"; and the two together mean "the northern morning-light," because it often looks like the daybreak in the east. In the southern hemisphere the aurora is known as *aurora australis*. The aurora is sometimes very beautiful, forming across the sky great arches of light through which flash bright streaks of red, blue, green, purple and yellow flame. It is supposed to be made by electricity or lightning passing through bodies of air of different thickness. A similar appearance may be produced by sending electric sparks through a glass vessel filled with rarefied air.

AUTOMOBILE

An automobile is a vehicle which travels on the ground by its own power. Siegfried Markus of Germany invented what was probably the first gasoline automobile in 1875. Most automobiles consist of a steel frame containing an engine fastened by axles and springs to four wheels. The flywheel of the engine is connected with the transmission gears through a clutch and a gear shifting device. By increasing the amount of gasoline and by shifting to a larger transmission gear the speed of the automobile is increased. By the differential gear the outside rear wheel travels faster than the inside rear wheel when going around a curve. A storage battery furnishes power to the electric motor which turns the flywheel and starts the engine. When the car is running the battery is recharged. The rear axle turns, but the front axle does not turn, the wheels being attached to it by movable joints, connected by a bar called the "drag link." An automobile is steered by a steering wheel equipped with a screw thread which brings about a forward or backward movement of the steering arm. A connecting rod applies this movement to the steering knuckle. The modern automobile is equipped with engines having from four to sixteen cylinders. The automobile propelled by electricity was at one time popular but never could compete with the gasoline-driven machine. A few types of automobile engines are air-cooled like the airplane engine, but the majority are water-cooled.

The first successful automobile built in America was by Duryea in 1892. In 1893 Henry Ford built a car, and in that year, also, a Benz automobile was imported for the World's Fair at Chicago. The following year Elwood Haynes' automobile appeared. Commercial automobile history in America began in 1898 when a Winton was sold, this being the first car sold in the United States. The Ford automobile was not marketed until 1903.

BARBER'S POLE

The spiral red stripe on a barber's pole is said to symbolize the winding of a ribbon or bandage around the arm of a patient upon whom the barber had operated in the capacity of surgeon. In former times, when the operation of bleeding was extensively practiced, blood-letting was one of the barber's duties.

BAROMETER

Torricelli, who studied under Galileo, invented the barometer in 1643, a device for measuring the pressure of the atmosphere. He filled a glass tube about one yard in length with mercury, then placing his finger over the open end of the tube, placing this end downward in a container of mercury, he then removed his finger and found that the fall of mercury from the closed end of the tube was determined by the air pressure. The pressure of the air upon the surface of the mercury in the container balanced the weight of mercury in the tube. Water may be substituted for mercury by using a tube about 33 feet long. For convenience, aviators, engineers and explorers usually use the aneroid barometer, which is a metal vacuum box with levers and an indicator attached so that an increase of atmospheric pressure on the box slightly depresses the box and this movement is enlarged several hundreds of times at the indicator.

Aviators find the barometer valuable in indicating their distance above sea level. The higher they go the lighter is the air pressure and therefore the barometer falls. In the mercury barometer the mercury falls about one-quarter of an inch for each 110 feet of rise.

The barometer is most valuable for predicting weather conditions and altitudes. Preceding a storm atmospheric pressure is light. Therefore, when the barometer falls this indicates that a storm is near at hand. Increasing pressure, indicated by a rising barometer, predicts fair weather. Continued fair weather is indicated by a continuous high barometer.

BEACON HILL

A famous locality in Boston. The old beacon, shown in all the early plans of the city, and which gave the name to Beacon Hill, was erected in 1634 and 1635 to alarm the country in case of invasion. It stood near the present State House, the exact spot being the southeast corner of the reservoir formerly standing on Temple Street. It was a tall mast, standing on cross timbers placed upon a stone foundation, supported by braces, and was ascended by treenails driven into it; and sixty-five feet from the base, projected a crane of iron, from which an iron skeleton frame was suspended, to receive a barrel of tar or other combustibles.

BEARS AND BULLS

Words often used in connection with the purchase and sale of stocks. The "bears" are those who seek to depress the value of stocks and securities, while the "bulls" are those whose interests prompt them to act in the other direction.

BEES, HUMMING OF

A bee's wings move very rapidly, vibrate and cause the air to move. It is this which brings about the humming sound.

BENEFIT OF CLERGY

Through an enactment in 1087, England granted to any man condemned to death the opportunity to save his life by proving himself to be a clerk or man of education. A certain verse of Scripture was chosen. If he could read it satisfactorily, he was freed. This law was officially withdrawn in the eighteenth century, but the phrase remains and has been used in a variety of ways. For example, "without benefit of clergy" is used today to mean "without the marriage ceremony."

BIBLE, MODERN TRANSLATIONS OF

The earliest translation of the New Testament of the Bible in Greek is that of the fourth century, and the Old Testament in Hebrew is from the ninth century. The earliest translation into Italian was made by Waldenses in the thirteenth century. In 1471 was printed the first Bible in Italian at Venice. The first French Bible was printed in 1477 and the first Spanish Bible in 1478. The accepted Protestant version was translated by Olivetan in 1535. In 1550 the Louvain Bible was translated into French and accepted as the Catholic version. The famous translation by Luther was printed in German in 1534.

About 1382 John Wiclif published an English translation of the Bible from the Latin version. This, revised by John Purvey, was called the Wiclif-Purvey Bible. The first English translation from the Greek was made by William Tyndale in 1525. The earliest complete English Bible was

published by Miles Coverdale in 1535. The following are later English translations: 1537, by Mathew; 1540, by Cranmer; 1560, by British exiles at Geneva, Switzerland; 1611, the famous King James Bible; 1582, the Reims New Testament, accepted by the Catholics; 1609, the Douai Bible, accepted by the Catholics; 1885, the Revised Version; 1901, American Revised Version.

BIRTH STONES

Two classifications are here given, the ancient (a) and modern (m).

January: the garnet (a), and the jacinth or hyacinth (m), symbolizing constancy and fidelity.
February: the amethyst (a and m) symbolizing peace of mind, sobriety, and sincerity.
March: the aquamarine (a), and bloodstone (m), symbolizing courage and success in dangerous enterprise.
April: the sapphire (a), symbolizing wisdom, and the diamond (m), symbolizing repentance and innocence.
May: the agate (a), and the emerald (m), symbolizing happiness and success in love.
June: the emerald (a), and the agate (m), symbolizing happiness. The agate also indicates long life and health. The pearl is preferred by many for June.
July: the sardonyx or onyx (a), and ruby (m), symbolizing respectively conjugal felicity and contented mind.
August: the carnelian (a), and sardonyx (m), symbolizing respectively cure of evils resulting from forgetfulness, and felicity.
September: the chrysolite (a), and sapphire (m), symbolizing wisdom, and also hope.
October, the opal (a), and tourmaline (m), symbolizing hope.
November: the topaz (a and m), symbolizing fidelity and friendship.
December: the ruby (a), and turquoise or the lapis lazuli (m), symbolizing prosperity and success.

BLACK MARIA

Black Maria, a name sometimes used for the closed wagon in which prisoners are carried to and from jail, originated in Colonial days. Maria Lee, a brawny negress proprietor of a sailors' boarding house in Boston, so often aided the police in taking unruly persons to jail that "call Black Maria" came to mean "arrest the person."

BLARNEY STONE

Blarney is a village in Ireland, in County Cork, about five miles from the far-famed city of Cork. It is chiefly celebrated as giving the name to a peculiar kind of eloquence which is said to be characteristic of the light-hearted natives of the Emerald Isle. The old castle at Blarney contains the identical stone, the kissing of which is believed to give the person peculiar skill in speech.

BLUE LAWS OF CONNECTICUT

These laws, enacted by the people of the "Dominion of New Haven," became known as the "Blue Laws" because they were printed on blue paper. They were as follows:

The governor and magistrates convened in general assembly are the supreme power, under God, of the independent dominion. From the determination of the assembly no appeal shall be made.

No one shall be a freeman or have a vote unless he is converted and a member of one of the churches allowed in the dominion.

Each freeman shall swear by the blessed God to bear true allegiance to this dominion and that Jesus is the only king.

No dissenter from the essential worship of this dominion shall be allowed to give a vote for electing of magistrates or any officer.

No food or lodging shall be offered to a heretic.

No one shall cross a river on the Sabbath but authorized clergymen.

No one shall travel, cook victuals, make beds, sweep houses, cut hair, or shave on the Sabbath Day.

No one shall kiss his or her children on the Sabbath or feasting days.

The Sabbath Day shall begin at sunset Saturday.

Whoever wears clothes trimmed with gold, silver, or bone lace above one shilling per yard shall be presented by the grand jurors and the selectmen shall tax the estate £300.

Whoever brings cards or dice into the dominion shall pay a fine of £5.

No one shall eat mince pies, dance, play cards, or play any instrument of music except the drum, trumpet or jewsharp.

No gospel minister shall join people in marriage. The magistrate may join them, as he may do it with less scandal to Christ's church.

Under the Blue Laws
The Blue Laws of Connecticut placed the ban on finery and provided a heavy penalty.

When parents refuse their children convenient marriages, the magistrate shall determine the point.

A man who strikes his wife shall be fined £10.

A woman who strikes her husband shall be punished as the law directs.

No man shall court a maid in person or by letter without obtaining the consent of her parents; £5 penalty for the first offence; £10 for the second, and for the third imprisonment during the pleasure of the court.

BLUE SKY

In the sky are many tiny dust particles. The rays of the sun are white in color, and what appears to be white light is in reality a combination of all the various colors. These rays of light from the sun striking the specks of dust in the sky are largely absorbed. However, short rays of light are reflected from these dust particles to us and these short waves are blue. Thus the sky appears blue to us.

BLUE SKY LAWS

The colloquial term for a law providing regulation and supervision of sale of stocks, bonds and other securities, so called because the proposer of the first such law in Kansas, in 1911, said that some companies sought to "capitalize the blue skies."

BLUE STOCKINGS

The term "blue stocking" originated in England in the days of Doctor Johnson and was applied to ladies who cultivated learned conversations at assemblies to which literary men were invited. One of the most popular members of one of these societies was said to have been a Mr. Stillingfleet, who always wore blue stockings, and by degrees the term "blue stockings" was applied to all clubs of the kind described, and, later, to ladies who attended them.

BOOK SIZES

The name indicates the number of pages in the sheet, thus: in a folio book, 4 pages or 2 leaves = 1 sheet; a quarto, or 4to, has 8 pages or 4 leaves to a sheet; an octavo, or 8vo, 16 pages or 8 leaves to a sheet. In a 12mo, 24 pages or 12 leaves = one sheet, and the 18mo, 36 pages, or 18 leaves = 1 sheet, and so on. The following are the approximate sizes of books:

Royal folio	19	inches	× 12
Demy	18	inches	× 11
Super imp. quarto (4to)	15½	inches	× 13
Royal 4to	12½	inches	× 10
Demy 4to	11½	inches	× 8½
Crown 4to	11	inches	× 8
Royal octavo	10½	inches	× 6½
Medium 8vo	9½	inches	× 6
Demy 8vo	9	inches	× 5½
Crown 8vo	7½	inches	× 4½
Foolscap 8vo	7	inches	× 4
12mo	7	inches	× 4
16mo	6½	inches	× 4
Square 16mo	4½	inches	× 3½
Royal 24mo	5½	inches	× 3½
Demy 24mo	5	inches	× 2½
Royal 32mo	5	inches	× 3
Post 32mo	4	inches	× 2½
Demy 48mo	3½	inches	× 2½

BRIDE, THROWING SHOE AFTER

The custom of throwing a shoe after a departing bride and groom originated far back in the dim and mystical past. It is by some thought to typify an assault, and is a lingering trace of the custom among savage nations of carrying away the bride by violence. Others claim that it has a likeness to a Jewish custom mentioned in the Bible. Thus, in the Book of Ruth, when the kinsman of Boaz gave up his claim to the inheritance of Ruth, and to Ruth also, he indicated his assent by plucking off his shoe and giving it to Boaz. Also, we read in Deuteronomy that when the brother of a dead man refused to marry his widow she asserted her independence of him by "loosing his shoe."

BRIDGES

A bridge is a roadway over a stream, a valley, or low ground. A bridge for carrying a canal or water to supply a city is an aqueduct (water leader); one over which a railway passes is a viaduct (road leader). The first bridges were made of wood by laying beams from one bank of a stream to the other, or, when these were too wide apart, resting them on posts or stone piers in the middle. The Chinese built bridges at a very early date, but it is supposed that the Romans were the first to construct stone bridges, and some of them, more than 2,000 years old, are still in use.

Geographical necessities in a country intersected by large and rapid streams compelled the Romans to give much attention to the

building of bridges. A splendid bridge was built by Augustus, near Narnia, on the Flaminian road, about sixty miles from Rome. Some of the arches, as is attested by one which is still standing, had a span of 150 and a height of 100 feet; but the greatest of all Roman bridges was that of Trajan across the Danube. It rested on twenty piers 150 feet in height from their foundation, and 170 feet apart, its width being 60 feet. This bridge was destroyed by the next emperor, Hadrian, who pled for his act the danger that the barbarians might get possession of it.

After the fall of the Roman empire not much was done in the way of bridge building for some centuries. In the twelfth century the order of the Fréres Pontiers was established, and by them the great bridge of Avignon, since destroyed, was built. It was about 3,000 feet long and rested on 18 arches. A bridge built over the Allier in 1454 had an arch 184 feet in span, almost the greatest reached by any existing stone bridge. The span of the Rialto of Venice is 98½ feet. Perronet's bridge over the Seine, at Neuilly, consists of five arches each with a span of 128 feet and a rise of 32 feet.

As wooden bridges are likely to catch fire, those made of iron and steel have largely superseded wooden construction.

Bridges that are not held up from below, but hung on some kind of ropes or chains, are called suspension bridges (Latin *suspendere*, to hang). The Chinese in very ancient times constructed this kind of bridge of iron chains, and the Peruvians made them of bark ropes. Modern suspension bridges are built of strong cables, composed of many small wires twisted together. Among the most celebrated suspension bridges are those of New York, Philadelphia and Detroit.

Bridges made so that they can be moved in order to let a vessel pass are of various kinds: (1) drawbridges, which include the ordinary bascule or jackknife type that is swung open like a pocket knife, and the vertical truss type that lifts straight up between two towers; (2) swing bridges to turn round on a pivot; and (3) rolling or sliding bridges, to roll backward and forward on little wheels or rollers.

Bridges that are to be used for only a little while, like those built for soldiers to cross rivers in time of war, are sometimes made by fastening many small boats together and laying a floor over them. Casks and rafts have also been used for the same purpose. Military bridges are usually supported by floats called pontoons, made of frames of timber covered with copper, tin, leather, tarred sail-cloth, or indiarubber cloth, or of copper cylinders. The pontoons are laid from bank to bank and securely fastened, and the bridge platform is then placed upon them.

Viaducts are bridges carried over valleys or other low levels.

Notable Bridges of the World. The number of bridges that are famous for their length or construction is constantly increasing. The following list includes noted and important bridges of the world.

Albany, N. Y. (over the Hudson). Iron drawbridge; length of draw, 400 feet.

Ambassador Bridge (spanning Detroit River between Detroit, Michigan, and Sandwich, Ontario, completed in November, 1929. Length of river span is 1,850 feet, length of bridge structure 7,400 feet, distance from entrance to exit 9,000 feet. Capacity 5,000 automobiles per hour. Unobstructed roadway, 47 feet wide with a capacity of five lanes of traffic and an 8-foot sidewalk. Cost, $20,000,000.

Berne, Switzerland. Over the river Aar, main span, 367 feet.

Bear Mountain Bridge, crossing Hudson River, north of Peekskill, N. Y., for vehicles. Length, 2,258 feet. Span, 1,632 feet. Completely built in one year, eight months and two days. Cost, $6,000,000. Completed 1924.

Blackwell's Island, N. Y. Crosses East River, steel cantilever, 7,636 feet long; cost $12,500,000.

Bonn, Germany. Steel arch, 1,800 feet long.

Bridge of the Holy Trinity (at Florence, Italy). Was built in 1569. It is 322 feet long, constructed of marble, and stands unrivaled as a work of art.

Britannia Tubular Bridge, carrying the Chester and Holyhead railway across the Menai straits in Wales, consists of two parallel rectangular wrought-iron tubes resting on three piers. There are two central spans of 459 feet, and two shore spans of 230 feet. The central pier is built on the Britannia rock, and its erection was begun 1846. The height of the tube within is 30 feet at the center, diminishing to 23 feet at the shore ends. The bridge has a clear headway above high water of 103½ feet.

Brooklyn Bridge. A wire cable suspension bridge connecting New York with Brooklyn; designed by John A. Roebling, and built by his son, W. A. Roebling. Length, with approach, 6,016 feet; length of central span, 1,595½ feet, two side spans of 930 feet each, with a clear headway under the center of the bridge of 133 feet above high water; total height of towers above high water, 278 feet; there are four suspension cables, composed of 5,296 galvanized steel wires, bound together, but not twisted; width of bridge, 85 feet; cost, $17,909,000; bridge begun 1870; opened, 1883.

Cabin John Bridge, D. C. Stone aqueduct with span of 220 feet; constructed, 1857-1864 at which time it was the longest stone arch in the world.

Cairo, Ill., crossing the Ohio River, a truss bridge, 20,461 feet long, including approaches; cost, $3,500,000.

Carquinez, over Carquinez Straits, Cal.; length, 4,482 feet; cost, $8,000,000.

Charleston, S. C. Bridge over Cooper River; length, 3 miles; cost, $6,000,000.

Chicago, Ill. (1) Halsted Street Bridge over Chicago River; noted lift bridge, with towers of steel framework, and a suspended truss span. (2) Michigan Avenue bridge, erected in 1918-20, a general traffic double-deck, two leaf bascule bridge. The bridge is 92 feet wide, 340 feet long and weighs 10,000 tons.

Cincinnati and Covington (over the Ohio). Built 1867; reconstructed, 1897; length, 2,720 feet; suspension.

Cincinnati Iron Truss Railway Bridge (across the Ohio River). Planned for a double-track railroad and two roadways and two sidewalks in addition. Total structure one mile in length; the center span 550 feet, and two spans flanking the main channel 490 feet each. Caissons sunk in 1887; completed, 1890.

Cleveland, Ohio, high level bridge crossing Cuyahoga River, 96 feet above water level. Two-deck bridge 81½ feet wide, 2,880 feet long, upper level roadway 45 feet wide. Twelve concrete arches, central span of steel, 174 feet between arches.

Clifton, now known as the Upper Arch (over Niagara River). Length, 1,268 feet. Longest single steel arch span in the world. Blown down 1889, rebuilt in 1898, replacing the Niagara and Clifton suspension, which was a chain bridge 702 feet long.

Danube River, at Cerno-Voda; length, with approaches, 12 miles.

Douro Bridge, an arched iron structure near Oporto, Portugal, total length, 1,150 feet, span of arch, 520 feet, height from low water to crown of arch, 198 feet. Opened in 1877.

Eads, St. Louis, Mo. Cast-steel arch, 6,434 feet long; opened, 1874.

Forth Bridge. Over the Firth of Forth, Scotland; cantilever; iron and steel; length, nearly two miles, including approaches; channel span, 1,710 feet. Opened in 1890; cost, $15,800,000.

Fribourg Suspension Bridge. Over the Sarine valley, Switzerland. 870 foot span; 167 feet above the river; built by N. Chaley, 1833-34.

Garabit Viaduct. Over the Truyère, in the south of France. The total length is 1,849 feet; the main portion, 1,469 feet in length, is of steel, and consists of five openings of from 170 to 182 feet, spanned by lattice girders and a trellis parabolic arch with a span of 541 feet, and a clear height above the river of 356 feet. The rail level is 401 feet above the river. Designed by M. Eiffel and built without scaffold. Begun, 1879; completed, 1884.

Harlem River Aqueduct (High Bridge). Stone; length, 1,450 feet; semi-circular arch.

Hell Gate Bridge. A steel arch bridge, 18,000 feet long, crossing East River in New York City from Manhattan to Brooklyn. Main span, 1,017 feet. Construction cost, $15,000,000. Opened, 1917.

Hudson River Bridge (Ft. Washington to Ft. Lee). New York City. Toll bridge of suspension type, built by the Port of New York Authority across the Hudson River between Ft. Washington Point (178th Street) and Ft. Lee, New Jersey. Begun in 1927. Length of span, 3,500 feet; length of side spans, 650 feet. Total length of bridge and approaches, 7,800 feet. Clearance above mean high water at center of main span, 213 feet. Height of towers above mean high water, 635 feet. Four cables, 36 inches in diameter, each cable of 26,424 galvanized wires 0.192 inches in diameter. Cables placed nine feet apart in pairs and side by side. Distance between center of cable pairs, 106 feet. Total width of bridge, 118 feet. Estimated cost, $75,000,000. Eight lanes of vehicular traffic, four rapid transit tracks and two sidewalks. The cables are anchored in solid rock on the New Jersey side and in concrete anchorage blocks on rock on New York side. Tower foundation on rock. Granite-faced masonry work.

International Bridge. A railroad bridge between San Angelo, Tex., and Chihuahua City, Mexico, was opened in November, 1930.

International Peace Bridge. A toll bridge over the Niagara River from Fort Porter, at Buffalo, N. Y., to Fort Erie, in the Province of Ontario, Canada, was opened on August 7, 1927. The bridge is of steel, with five granite-covered concrete piers. It is 4,150 feet long; with a vertical clearance of 100 feet above the river, and a horizontal clearance of about 345 feet above Black Rock Canal which parallels the Niagara. The only vehicular bridge spanning the Great Lakes border between Duluth, Minn., and Niagara Falls; it has a capacity of 3,000 automobiles an hour; cost, $4,500,000.

Interstate, a vertical lift bridge crossing the Columbia River at Vancouver, between states of Oregon and Washington. It is 23,000 feet long, 150 feet in height. The main span is 275 feet. Completed 1917.

Kansas City, Mo., crossing the Missouri River, vertical lift 5,340 feet.

Karlsbrücke (Charles' Bridge), over the Moldau at Prague. Built by Emperor Charles IV. of Germany, 1384. 1,855 feet long. Gate towers at either end, ornamented with groups of statuary. Greatly damaged by flood, September, 1890; since repaired.

Keithburg, Ill., crossing the Mississippi River, vertical lift, 3,804 feet.

Loa Viaduct, a lattice girder iron bridge by which the Antofagasta railway of Bolivia crosses the canyon of Loa at an altitude of 10,000 feet above the sea level. The bridge was put together in nine months under the supervision of Peter and John Fisher, who went from England for the purpose.

London Bridge. One is said to have existed, 978. A bridge built of wood, 1014, was partly burned in 1136. The old London bridge was the first stone bridge. It was commenced in 1176, and completed in 1209. Its founder, Peter of Colechurch, was buried in the crypt of the chapel erected on the center pier. The new bridge was designed by John Rennie, and built by his sons, John and George. The first pile was driven 200 feet to the west of the old bridge, March, 1824; the first stone was laid by the lord mayor, alderman Garratt, June, 1825; opened by William IV. and his Queen, August, 1831. Total cost, $7,291,000; length of central span, 152 feet.

Louisville, Ky. (Over the Ohio.) Length, 5,310 feet.

Luxembourg. Stone, containing span of 277 feet; largest single arch stone bridge in the world.

Maintenon Aqueduct. Stone; length, 16,367 feet; semi-circular arch.

Manhattan. A suspension bridge crossing the East River in New York City, 135 feet above high water. Length is 6,855 feet; main span, 1,470 feet. Construction cost, $16,700,000. Opened for traffic 1909.

Metropolis, Ill., crossing the Ohio River. Truss, 5,700 feet.

Mid-Hudson Bridge, Poughkeepsie, N. Y., over the Hudson River to Lloyd, Ulster County; total length, 4,072 feet; clearance above mean high water, 135 feet; height of towers above mean high water, 308½ feet; estimated cost, $6,000,000. Begun, 1925.

Minneapolis, Minn., the Cappellon Memorial Bridge, 1,015 feet long; completed in 1923. At that time the longest concrete arch in the world. Has one 400-foot arch; two 200-foot arches, and two 55-foot arches.

Montpelier Aqueduct. Stone; length, 3,214 feet; semi-circular arch.

Niagara Falls Suspension Bridge. Across the gorge, two miles below the falls. Built by John A. Roebling. Length of span between towers, 800 feet; supported by four wire cables, each containing 3,640 wires; height of track above the water, 245 feet; carriage-way beneath the track; cost of bridge, $400,000; work begun, 1852; first locomotive crossed, March, 1855.

Philadelphia-Camden. Suspension. Length, 8,126 feet; height, 135 feet; span, 1,750 feet. Cost, $29,000,000. Completed 1926.

Pier Viaduct Bridge, across the mouth of the Tay, near Dundee, Scotland; 85 spans; total length over 10,500 feet; opened in 1887.

Pittsburgh, Pa., over Alleghany River. Simple truss, length, 2,122 feet; opened in 1921.

Quebec. Cantilever bridge at Quebec, Canada. Length, 3,240 feet; height, 150 feet; span, 1,800 feet. Completed 1917, at cost of $9,000,000.

Queensborough, N. Y. Iron cantilever bridge across the East River; when opened, in 1909, was the largest of its kind in the world, bearing traffic; length, 7,449 feet; has four elevated railroad tracks, four trolley tracks, two walks for pedestrians. Cost, $15,000,000.

Rockville Bridge. Near Harrisburg, Pa., four-track stone railway bridge. Length, 3,810 feet. It contains forty-eight 70-foot stone arches and cost $1,000,000.

Samar, over the Volga River, Russia; length, 4,500 feet; cost, $3,500,000.

Sault Ste. Marie, Mich. Canadian Pacific Railroad bridge. Two-leaf bascule, 914 feet long.

Sciotoville, Ohio, across the Ohio River, a continuous truss bridge, 3,436 feet long.

Severn, England. Length, 4,163 feet; cost, $5,000,000.

Sidi Rached, Constantine, Algieria, a masonry arch, 1,468 feet long.

Spokane, Portland R. R., Portland, Ore., swinging truss, 1,762 feet, largest of its type in the world.

St. Louis (across the Mississippi). Minnesota and North Western R. R.; iron; 1,825 feet long; draw span 412 feet long, the latter being one of the largest and heaviest in the world. The width on top, between rails, is 50 feet. The piers rest on the bedrock of the river, 136 feet below high water mark. Captain James B. Eads was the engineer; cost, $10,000,000.

St. Louis Municipal Bridge. Simple truss, crossing the Mississippi River at St. Louis, Mo. Length is 17,922 feet; length of main span is 668 feet. Height, 65 feet. Opened 1913.

Sukkur Cantilever Bridge, crossing the Rori branch of the Indus at Sukkur, with a single span of 790 feet; opened in 1889.

Sydney Harbor, Australia. The largest bridge of the arch type in the world. A single span of 1650 feet, with over-all length, including approaches, of 3770 feet. Cost $40,000,000.

Tay Bridge, a girder bridge that crosses the Tay at Dundee, Scotland, and has a total length of 10,612 feet. Engineer, Sir Thomas Bouch. Begun, 1871; completed, 1877; opened, 1878. Partly destroyed by a gale while a N. British mail-train was passing over it; the train and passengers disappeared, none escaping. A gap of about 3,000 feet was made in the bridge.

Thebes, Ill., crossing the Mississippi River. Cantilever, 3,695 feet long.

Third Avenue, New York City. Length with approaches, 2,228 feet; length of span, 300 feet; height above water, 24 feet; opened in 1898. Cost of construction, $1,783,412; with land, $3,997,076.

Tower Bridge. Steel and masonry bascule drawbridge across the Thames below London bridge. It has a central opening of 200 feet between two high towers, connected near the top by a fixed foot-bridge 139½ feet above the river and reached by elevators or stairways in the towers. There are two side spans of 270 feet covered by chain suspension bridges, and between the towers, at a height of 29½ feet above high water, a double bascule, each leaf 100 feet in length and forming a flat arch when down, at a level with the main bridge. Foundation laid in 1886; opened in 1894. Cost, $7,786,400.

Victoria Bridge over the Thames at Pimlico, London, consists of four wide wrought-iron arches. Begun, 1859; completed, 1860; widened, 1865-66.

Victoria Bridge, Montreal, one of the most famous in the world, is nearly two miles in length. It rests on 24 piers, the height being 60 feet above summer level of the river; begun, 1854; formally opened by the Prince of Wales, August, 1860. Replaced, 1898-1899, by a pin-connected truss bridge of 25 spans; and in 1906 by a new steel bridge.

Washington Bridge (across Harlem River valley, N. Y.); two steel arches of 509 feet span; roadway, 80 feet wide; length, 2,375 feet; height above the Harlem River, 133½ feet; opened, December, 1888. Construction cost, $2,851,000.

Waterloo Bridge (over the Thames at London). Length within abutments, 1,242 feet; width within balustrades, 42 feet; span of each arch, of which there are nine, 120 feet. It was opened on the anniversary of the Battle of Waterloo, the duke of Wellington and others being present, June, 1817. Cost, $2,400,000.

Willamette River, Portland, Ore. Two-deck vertical lift, 1,623½ feet long.

Williamsburg. Across East River, connecting Manhattan and Brooklyn. Total length, 7,308 feet; main span, 1,600 feet; width, 118 feet; height above mean high water, 135 feet; cost, $15,000,000, exclusive of real estate. Opened in 1903.

(See also **Natural Bridges.**)

BRITISH LION

This term symbolizes the spirit of pugnacity of the British nation, as opposed to "John Bull," which symbolizes the substantiality, obstinacy and solidity of the British nation, with all its prejudices and national peculiarities. To rouse John Bull is to tread on his corns; to rouse the British lion is to blow the war trumpet in his ears.

BROTHER JONATHAN

This name is a collective personification of the people of the United States. When General Washington, after being appointed commander of the army of the Revolution, came to Massachusetts to organize forces and make preparations for the defense of the country, he found a great want of ammunition and other means necessary to meet the powerful foe he had to contend with; and he found it very difficult to obtain them. If attacked in such condition, the cause at once might be hopeless. On one occasion, at that anxious period, a consultation of the officers and others was had, when it seemed no way could be devised to make such preparation as was necessary. His excellency, Jonathan Trumbull, the elder, was then governor of the state of Connecticut. On Trumbull's judgment and aid the General placed the greatest reliance, and remarked: "We must consult Brother Jonathan on the subject." He did so, and the governor was successful in supplying many of the wants of the army. When difficulties afterward arose, and the army was spread over the country, it became a byword, "We must consult Brother Jonathan."

BUILDINGS AND MONUMENTS

Probably the most famed monuments in the United States are the memorials to Washington and Lincoln and the monument at Bunker Hill.

Another important monument is that of the tomb to the unknown soldier of the United States. In the Northwest a memorial lighthouse commemorates the pioneers who opened up that vast empire.

Washington Monument. Notwithstanding the fact that the plan of a monument to General Washington was approved by Congress in the latter part of December, 1799, nothing was done in the matter until 1833, when an association of prominent persons undertook the raising of the needed funds by subscription, and on July 4, 1848, had so far succeeded in their undertaking that the cornerstone of a monument was laid, and during the succeeding eight years the shaft was carried to a height of 156 feet. The plans were prepared by Robert Mills, an architect. The work was then suspended, at first for lack of funds, then because of the Civil War, and finally because the foundations were believed to be insecure.

In 1876 Congress undertook the completion of the monument. The base was first strengthened, and the work of rebuilding the shaft was resumed in August, 1880. The placing of the 3,300-pound capstone marked the completion of the work, Dec. 6, 1884. The shaft is 555 feet 5⅛ inches high. The base is 55 feet 1½ inches square. At 500 feet above the ground the monument has four sides, each of which is 35 feet wide. The capstone is crowned by a pyramid of aluminum. The monument is constructed of white Massachusetts marble for the first thirteen courses. Above these the courses are of white Maryland marble backed with granite up to 452 feet. Above that the walls are wholly of marble.

Lincoln Memorial, situated in West Potomac Park, Washington, D. C., was erected by authority of Congress and dedicated on May 30, 1922. The architect was Henry Bacon of New York. The building is constructed of marble, granite, limestone, brick and concrete, while the ceiling consists of bronze beams with rectangular openings in which are placed thin slabs of Tennessee marble. These admit the light from overhead, a glass skylight covering the building. The building is nearly 202 feet long. There is a central Memorial Hall with two wings. There are thirty-six columns in the colonnade, excluding the two which stand in the entrance. These stand for the thirty-six states that existed at the time of Lincoln's death. The statue of Lincoln, by Daniel Chester French, is of white marble, a seated figure, measuring nineteen feet from the top of the plinth to the top of the head, and the extreme width is the same. Weatherproof decorations on canvas by Jules Guerin represent the emancipation of a race and reunion and progress. On the walls are Lincoln's Gettysburg speech and his second inaugural address.

The Memorial is approached by a series of steps rising from a small pool in which the building is mirrored on a clear day.

Bunker Hill Monument. The cornerstone of this monument was laid on the fiftieth anniversary of the battle of Bunker Hill, June 17, 1825, by Lafayette, and the oration was pronounced by Daniel Webster. It is a square shaft of Quincy granite, 221 feet high, 31 feet square at the base, and 15 feet at the top. Inside the shaft is a round, hollow cone, 7 feet wide at the bottom, and 4 feet 2 inches at the top, encircled by a winding staircase containing 224 stone steps, which lead to a chamber 11 feet in diameter immediately under the apex. The chamber has four windows, and contains two cannons, named Hancock and Adams, respectively. These cannons were used in the Revolution. The monument was completed and was dedicated June 17, 1843.

Tomb of the Unknown Soldier. In Arlington National Cemetery, Va., is a block of white marble, a monument "to the unknown soldier of the United States." An inscription dedicates the tomb to all the unidentified American dead who fell in the World War. It has become a shrine that is sought out by thousands. Visiting rulers, statesmen and soldiers customarily make pilgrimages to Arlington and lay wreaths of honor on the plain marble tomb.

In Great Britain the tomb of her unknown warrior is within the confines of Westminster Abbey in London among the great personages of history. France has placed her unknown soldier under the Arc de Triomphe in Paris and there keeps a perpetual light burning. In Italy the unknown soldier of that nation lies beneath a splendid monument on a prominent site in Rome. In Belgium the unknown soldier of that country lies at the base of the Congress Colonnade in Brussels and a perpetual light is kept burning there.

A memorial lighthouse, at the mouth of the Columbia River, was dedicated in July, 1926. It is designed as a monument to those pioneers of the Northwest, Robert Gray, who discovered the Columbia and named it after his sailing vessel; Lewis and Clark, who made the first overland exploration trip across the United States to the Northwest, and to John Jacob Astor, under whose guiding hand the development of the region began.

Buildings, Highest. The newer buildings in the United States, especially the tall hotel, apartment and business structures in the larger cities, are characteristically American in form. Built of steel on concrete base, they rise to great heights. Among the highest buildings in the world are:

Name of Building	*Height in Feet*
Empire State, New York	1,248
Chrysler Tower, New York	1,046
Eiffel Tower, Paris	989
60 Wall Tower, New York	942
Woolworth, New York	792
393-411 Lexington Ave., New York	755
Terminal Tower, Cleveland	708
Metropolitan, New York	700
Chanin Tower, New York	680
American Exchange, Irving Trust, New York	645
Manufacturers Club, Philadelphia	640
Lincoln, New York	638
Sherry-Netherland Hotel, New York	620
Mercantile, New York	617
10-14 East 40th Street, New York	617
Singer, New York	612
New York Life Insurance, New York	610
Board of Trade, Chicago	600
Transportation, New York	586
Municipal, New York	580
Penobscot, Detroit	557
Pittsfield, Chicago	557
Chicago Temple, Chicago	556
20 North Wacker Drive, Chicago	555
701-719 First Ave., New York	553
Equitable Trust, New York	550
Ritz Tower, New York	540
Bankers' Trust, New York	539
City Hall, Philadelphia	548
One North La Salle, Chicago	530
Ulm Cathedral, Germany	529
Morrison Hotel (addition), Chicago	526
Travers, Hartford, Conn	525

Empire State Building

The highest building in the world, in New York City.

BURY THE HATCHET

Let bygones be bygones. The Great Spirit commanded the North American Indians, when they smoked the calumet or peace pipe, to bury their hatchets, scalping knives and war clubs in the ground, that all thought of hostility might be buried out of sight.

The ceremony was a solemn function and was regarded by the Indians in the same light that civilized man regards a signed treaty of peace between nations.

> Buried was the bloody hatchet;
> Buried was the dreadful war-club;
> Buried were all warlike weapons,
> And the war-cry was forgotten:
> Then was peace among the nations.
>
> Longfellow, *Hiawatha*

CAPITAL PUNISHMENT IN THE UNITED STATES

The crime of murder is punished by death in most of the states and by the federal government of the United States. The federal penalty is hanging. Some states that formerly had no death penalty have instituted one for specific crimes.

Punishment by hanging is the penalty in California, Idaho, Iowa, Kansas, Louisiana, Maryland, Mississippi, Missouri, Montana,

CALENDAR FOR READY REFERENCE

For ascertaining any day of the week for any given time within the two hundred years from the introduction of the new style, 1753 to 1952, inclusive.

Note. The letters in the list of "Years from 1753 to 1952," refer to the table headed with the Months; the figures in which refer to the same figures at the head of the Table of Days. For example: To know on what day July 4, 1911, fell, look for 1911 in the Table of Years. The letter "f" is attached. Look for the same letter in the Table of Months and in a parallel line under July is the figure 6, which directs to column 6 in the Table of Days below, in which it will be seen that July 4, 1911, fell on Tuesday.

TABLE OF DAYS

1		2		3		4		5		6		7	
Monday	1	Tuesday	1	Wednesday	1	Thursday	1	Friday	1	Saturday	1	SUNDAY	1
Tuesday	2	Wednesday	2	Thursday	2	Friday	2	Saturday	2	SUNDAY	2	Monday	2

Wednesday	31	Thursday	31	Friday	31	Saturday	31	SUNDAY	31	Monday	31	Tuesday	31

New Hampshire, Oregon, Washington, West Virginia. Utah permits either hanging or shooting. Electrocution is authorized in Alabama, Arkansas, Connecticut, District of Columbia, Florida, Georgia, Illinois, Indiana, Kentucky, Massachusetts, Nebraska, New Jersey, New Mexico, New York, Ohio, Oklahoma, Pennsylvania, South Carolina, Tennessee, Texas, Vermont and Virginia. Arizona, Colorado, Delaware, Nevada, North Carolina and Wyoming use lethal gas. Life imprisonment is the most severe sentence in Maine, Michigan, Minnesota, North Dakota, Rhode Island, South Dakota and Wisconsin. In some of these states where imprisonment is the only penalty for murder, hanging is inflicted on a person who, while serving a life term, kills another. Similarly, in some death penalty states, the jury may fix the punishment at life imprisonment.

CARPETBAGGERS

Corrupt and often ignorant politicians—mostly from the North—who flocked to the South during the era of reconstruction. They were uniformly greedy of gain, and were responsible for much of the venality and rascality that disgraced that period of the history of the South.

CASTE AMONG THE HINDUS

Caste is a term applied to the division into social classes in India. To each of these classes certain pursuits are limited by the Laws of Manu, B.C., 960.

(1) The Brahman or priestly class, which "issued from the mouth of Brahma."

(2) The Kshatriya or military class, which "sprang from the arm of Brahma."

(3) The Vaisya or mercantile class, which "sprang from the thigh of Brahma."

(4) The Sudra or laboring class, which "sprang from the foot of Brahma."

(5) The pariahs are lower in caste and usually work for the farmers. The chandalas are the lowest caste, considered the lowest of mortals.

CAVES

Caves or caverns are hollow places formed in the earth or rocks, usually the result of the eroding action of water or dislocation of rock strata. Caves are found throughout the world. Early in human history Europe sheltered tribes known as the Cave Dwellers. In many of these ancient caverns are found human remains. A cave in Java contained a skull and certain other fragments that indicate man's existence at a very remote period. In Spain are famous caverns on the walls of which are found some of the earliest of picture writing with pictures of animals long extinct whose fossil bones are now found in ancient glacier trails. The caves at Combarelles, France, contain over 400 animal sketches, including mammoths, reindeer, ibexes, wolves, bears, horses, and one of a lion.

Kent's Hole, in Torquay, England, in 1824 yielded fossil bones and teeth of animals long extinct in that country. The famous basaltic Fingal's Cave in the island of Staffa, Scotland, rivals the Blue Grotto of Capri in beauty. Tofière, or Cave of the Doubs, on the frontier of France and Switzerland, lying more than 3,200 feet above sea level, is the source of the Doubs River. Near the entrance of the cave are inscriptions indicating that two kings have visited this cavern.

The most widely known caverns in the United States are the Carlsbad, Luray, Mammoth and Wyandotte caves.

Carlsbad Caverns, in the foothills of the Guadalupe Mountains, New Mexico, were designated as a National Monument by President Coolidge. These immense limestone caverns have been only partially explored. Near the entrance are found vast colonies of bats, many of them of the Mexican free-tailed species that produce the valuable fertilizer, guano. In the caves are millions of stalactites and stalagmites of every form and design, composed of purest onyx. Many rooms are covered by sheets of drapery that look like fabric but are made of stone, translucent, and less than an inch thick. Water charged with carbon dioxide and lime water springs are found in the caverns and the chemical action of these waters has helped change the character of the stone. Many rooms are walled by marble, the Dome Room, 150 by 50 feet in size, being covered with onyx and with pink and yellow marble that hang like carefully pleated draperies from walls and ceiling. In some places great domes, 30 to 40 feet high, rise from the top of flowstone mounds that are 50 feet high.

© *Santa Fe System Lines*

Carlsbad Caverns

Stalagmites of monster proportions in the Big Room, a subterranean chamber more than three-fourths of a mile long, with a maximum width of 625 feet and a maximum ceiling height of 300 feet.

Luray Caverns in the Shenandoah Valley, Virginia, are a series of beautiful rooms with particularly fine doming and stalactite formations. Discovered in 1878, the caves cover about a hundred acres.

Mammoth Cave, discovered in 1809, is the largest known cavern in the world. It is situated in Edmonson County, Kentucky, 99 miles from Louisville. The immediate district is one abounding in large caves and the surface is characterized by thousands of sinkholes. It is estimated that there are 4,000 sinkholes and 500 open caverns. An area of 8,000 square miles in Kentucky and Tennessee is of more or less the same character. There is almost no surface drainage, the surface water immediately finding its way into the sinks and through the subterranean caverns and channels that everywhere abound. Green River, which gathers most of these waters, flows from 300 to 600 feet below the general level of the upland country and many of the caverns reach down to this underground water level. This action is now known to be the origin of the caves and sinks. The oölitic subcarboniferous limestone in which most of them occur has been dissolved along its joints by the percolating water, a not unusual process in other limestone regions.

Mammoth Cave is in reality a complex series of more than 200 rooms, chambers, domes, abysses, pits, grottoes, avenues and galleries extending nine miles underground. In certain of the lower caverns there are rivers, cataracts and lakes, varying in volume with local rain supply.

The most remarkable portions are the great pits and domes, which are caverns of unusual vertical extent. They are in reality the same pits extending downward and domes upward from the main points of observation. Crevice Pit with Klett's Dome, which is a part of it, is 150 feet in total vertical measurement. The Bottomless Pit is 105 feet in depth. Broadway, an avenue that is three miles long, sixty feet wide in parts, and forty feet high, is the longest roadway. Many parts of the cave are beautifully incrusted with gypsum and other deposits, while stalactites and stalagmites are abundant in some of the lower portions. Where these crusts are covered with crystals, their sparkling is especially impressive, resembling a fairyland.

The Dead Sea, Lake Lethe, the Styx, and the Crystal and Echo rivers are the largest stretches of water.

The outer galleries of the cave are inhabited by multitudes of bats. There are two species of blind fish, crayfish, crickets, and a few other insects.

Wyandotte Cave in Indiana is famous for its crystals, said to be more beautiful than those found in Mammoth Cave. The Pillared Palace and Monument Mountain are among the famous features of the cave, which is about twenty-three miles long.

There are many other American caves of interest. Among those which have been recognized and protected by the United States as national monuments are Lewis and Clark Cavern in Montana, Shoshone Cavern in Wyoming, Jewel Cave and Wind Cave in South Dakota, Lehman Caves in Nevada, Oregon Caves in Oregon and Timpanogos Cave in Utah. See also **National Monuments; National Parks.**

CENTER OF AREA AND POPULATION OF THE UNITED STATES

The center of area of the United States, excluding Alaska and Hawaii and other possessions, is in northern Kansas, in approximate latitude 39 degrees, 55 minutes, and approximate longitude 98 degrees, 50 minutes.

The centers of population, indicated below, are, therefore, considerably east of the center of area.

Date	Center of Population Approximate Location of Important Towns	Westward Movement During Preceding Decade In Miles
1790	23 miles east of Baltimore, Md.	..
1800	18 miles west of Baltimore, Md.	41
1810	40 miles northwest by west of Washington, D. C.	36
1820	16 miles north of Woodstock, Va.	50
1830	19 miles W. S. W. of Moorfield, in the present State of W. Va.	39
1840	16 miles south of Clarksburg, in the present State of W. Va.	55
1850	23 miles S. E. of Parkersburg, in the present State of W. Va.	55
1860	20 miles south of Chillicothe, Ohio	81
1870	48 miles east by north of Cincinnati, Ohio	42
1880	8 miles west by south of Cincinnati, Ohio	58
1890	20 miles east of Columbus, Ind.	48
1900	6 miles southeast of Columbus, Ind.	14
1910	Bloomington, Ind	39
1920	1.9 miles west of Whitehall, Ind.	9.8

CHARACTER BY THE MONTH

Here is an old astrological prediction (see **Astrology**), said to indicate the character of a girl according to the month in which she happens to be born:

If born in January, she will be a prudent housewife, given to melancholy, but good-tempered.

If in February, a humane and affectionate wife and tender mother.

If in March, a frivolous chatterbox, somewhat given to quarreling.

If in April, inconstant, not intelligent, but likely to be good-looking.

If in May, handsome and likely to be happy.

If in June, impetuous, will marry early, and be frivolous.

If in July, passably handsome, but with a sulky temper.

If in August, amiable and practical, and likely to marry rich.

If in September, discreet, affable, and much liked.

If in October, pretty and coquettish, and likely to be unhappy.

If in November, liberal, kind, of a mild disposition.

If in December, well proportioned, fond of novelty, and extravagant.

CHRISTMAS TREE

The Christmas tree, which has become an almost universal symbol, and is by most persons supposed to have originated in Germany, had its origin in Egypt at a period long before the Christian era. The palm tree is known to put forth a branch every month, and a spray of this tree, with twelve shoots on it, was used in Egypt at the time of the winter solstice, as a symbol of the year completed. In northern regions a fir was substituted for the palm.

CITIES, POPULAR NAMES OF

Certain cities have received popular names because of their identification with particular religious beliefs, observances, educational or literary pre-eminence, topography, resemblances to other cities, location, dominant industries, surroundings, or for similar reasons.

Aberdeen, Scotland. Granite City, from the prevalence and use of this stone.

Agra, India. Rome of Hindustan. It was the seat of the Mohammedan empire in India, and its ancient structures are on a scale of great magnificence.

Alexandria, Egypt. (1) Delta City, from the delta of the Nile. (2) Mother of Books, because there was deposited the largest collection of books ever gathered together prior to the invention of printing.

Allahabad, India. Holy City of the Indian Mahammedans.

Amiens, France. Little Venice, because it is so intersected by different branches of the Somme and the numerous bridges over them, as to have moved Louis XI. to bestow on it the above name.

Amsterdam, Holland. Venice of the Netherlands, because of its canals.

Antioch. (1) Queen of the East, because it was formerly the capital of Syria, and the place of residence of the Macedonian kings and Roman governors. (2) Mother of Christian Mission. From thence (Acts xiii, 1-3) Paul started on his first missionary journey.

Athens, Greece. (1) The Violet Crowned, so named by Pindar, in allusion to the violet crowns offered to the god at the Dionysiac festivals. It soon became a stock phrase, and, according to Aristophanes, every stump orator could win over his audience by judicious use of "violet-crowned city," or "ancient violet-crowned Athens." (2) Religious City, a name given by the old writers. It is said that there were 30,000 temples, statues and sacred places dedicated to worship of the heathen gods. (3) Eye of Greece, because the most renowned of Greek cities.

> Athens, the eye of Greece, mother of arts
> And eloquence, native to famous wits
> Or hospitable.
>
> Milton, *Paradise Regained*, Book iv.

Atlanta, Ga. The Gate City, so named by Jefferson Davis during the Civil War, it being, in his estimation, the most important inland position, from a military point of view, in the South.

Baalbec, Syria. City of the Sun, the Heliopolis of the Greeks, is often referred to by this title, which is a translation of its two names. It is celebrated for its superb ruins, yet extant, of an ancient temple dedicated to the sun.

Baghdad, Irak. City of Peace.

Baltimore, Md. Monumental City. It contains the Washington and Battle monuments and many others.

Berlin, Germany. City of Intelligence, from its numerous educational institutions.

Birmingham, Ala. Magic City, so named on account of its rapid rise into size and prominence.

Birmingham, England. The Midland Capital from its geographical location.

Bologna, Italy. The Fat City. In the days of the Italian republics the city of Bologna was so named.

Boston, Mass. (1) Athens of America, because famed alike for its institutions of learning and the culture of its citizens. (2) City of Notions, referring to numerous manufactured articles of all kinds commanding a large sale. (3) Tri-Mountain City, from the three hills on which it was originally built. (4) Hub of the Universe; a humorous appellation popularly applied, originated with Oliver Wendell Holmes.

Batavia, in Java. Queen of the East, being the metropolis of the Dutch East Indian possessions.

Benares, India. Holy City of the Hindus.

Brighton, England. Queen of Watering Places, from its popularity as a seaside resort.

Brooklyn, N. Y. City of Churches, from the large number of churches.

Buffalo, N. Y. Queen City of the Lakes, because of its commanding position on the Great Lakes.

Calcutta, India. City of Palaces, from the number of elegant residences.

Chicago, Ill. Windy City, from the winds blowing from Lake Michigan.

Cincinnati, Ohio. Queen City, so called when it was the commercial metropolis of the Middle West.

Cleveland, Ohio. Forest City, from the number of trees on its streets.

Cologne, Germany. (1) City of the Three Kings, in reference to the old legend which makes Cologne the burial place of Balthazar, Melchoir, and Jasper, the "wise men of the East." (2) Rome of the North, so called in the Middle Ages, from its wealth, power and ecclesiastical foundations.

Columbus, Ohio. The Arch City, from the memorial arch to William McKinley (with sculpture by H. A. MacNeil).

Constantinople, Turkey. City of the Golden Horn, from the name of its harbor.

Cordova, Spain. Athens of the West; under its Mohammedan rulers it attained great eminence in the domain of letters.

Cork, Ireland. Athens of Ireland, because it was the domicile or the birthplace of many erudite and eminent Irishmen.

Cuzco, Peru. Holy City of the Ancient Incas.

Damascus, Syria. Pearl of the Desert, because of its beautiful site.

Denver, Colo. Queen of the Plains.

Detroit, Mich. City of the Straits, from its location on the strait connecting Lake St. Clair and Lake Erie.

Dresden, Germany. German Florence, so named for its wealth in works of art and scientific treasures.

Duluth, Minn. Zenith City of the Unsalted Seas; thus named by Proctor Knott in a famous speech in Congress.

Edinburgh, Scotland. (1) Auld Reekie, so named on account either of (a) its filthy and ill-smelling thoroughfares, or (b) the canopy or cloud of smoke that seems to overhang the city when viewed from a distance. (2) Maiden Town. An old legend has it that it was to this place the fair daughters of the Pictish monarchs were consigned for safety in time of war. (3) Modern Athens. It is the headquarters of learning in Scotland; as a literary town it is second only to London.

Florence, Italy. (1) Lily of the Arno. (2) The Gentle. In the palmy days of the Italian republics Florence was so named. "In the mouth of an Italian this adjective includes all the amenities and agreeableness resulting from a high state of civilization."

Foochow, China. Happy City. Foochow means "happy" in Chinese.

Galway, Ireland. City of the Tribes, because, in 1235, there settled here thirteen clans, named Athy, Blake, Browne, Budkin, Burke, D'Arcy, Ffont, Joyce, Kirwan, Lynch, Martin, Morris and Skerrett.

Geneva, Switzerland. Rome of Protestantism. Under the guidance of Calvin and his associates it became a stronghold of the Reformation.

Genoa, Italy. The Superb was what medieval Italy called her.

Halifax, Nova Scotia. Warden of the North, from its importance as a British fort and naval base.

Hannibal, Mo. Bluff City, from its location on the bluffs of the Mississippi River.

Hartford, Conn. Charter Oak City, after the oak tree in which Connecticut's Colonial charter is said to have been concealed.

Holyoke, Mass. Paper City, from its extensive paper mills.

Indianapolis, Ind. Railroad City, from its being a great railroad center.

Jerusalem, Palestine. (1) City of Peace; its ancient name, Salem, signifies "peace." (2) Holy City of the Jews and Christians. (3) City of the Great King, so named in the Scriptures. (4) City of David, so named by King David, who captured it from the Canaanites, 1049, B.C.

Keokuk, Iowa. Gate City, from its situation at the foot of the Mississippi Rapids.

Leningrad, Russia (U. S. S. R.). (1) City of Perspectives; its streets and quays are famous for the long vistas they present. (2) City of Snow; for nine months in every year it is shrouded in a canopy of snow.

Lhasa, Tibet. Rome of Buddhism. It is the holy city of the Buddhists in Asia.

Liverpool, England. The Modern Tyre, after the important seaport of antiquity.

London, England. (1) City of Masts, so named from the spectacle formerly presented by its vast array of shipping. (2) Modern Babylon. In point of size it is the greatest in the modern world, as Babylon is believed to have been of the ancient. (3) Lud's Town. So called after Lud, a mythical king of Britain.

Louisville, Ky. Falls City, from the falls of the Ohio River at Louisville.

Lowell, Mass. City of Spindles, from its large manufacturing interests.

Lucknow, India. City of Roses, because embowered with them.

Lynchburg, Va. Hill City; Tobacco City; tobacco is one of the chief staples of trade.

Manchester, England. Cottonopolis, on account of its extensive manufactures of cotton.

Mecca, Hejaz. Holy City of the Mohammedans.

Medina, Hejaz. Prophet's City. To this place Mohammed fled for refuge during the Hegira, July 16, 622; and here is his tomb.

Milan, Italy. Little Paris, in allusion to its similarity to the French capital in point of gaiety.

Milwaukee, Wis. Cream City, from the cream-colored brick manufactured there.

Minneapolis, Minn. Flour City, from its extensive flour mills.

Montpelier, Vt. The Green Mountain City, from its location.

Montreal, Canada. Island City. It is built on an island of the same name.

Moscow, Russia. Holy City (under the czarist regime).

Naples, Italy. The Beautiful, from its location on the Bay of Naples.

Nashville, Tenn. City of Rocks, from its natural surroundings.

New Haven, Conn. City of Elms, from the great number of elms it contains.

New Orleans, La. Crescent City, from its position on a curve of the Mississippi.

Newport, R. I. (1) City by the Sea, famous as a fashionable summer resort. (2) City of Mansions.

New York, N. Y. (1) Empire City, from its being the chief city of the United States. (2) Gotham a, colloquial term applied in *Salmagundi* by Washington Irving and James K. Paulding, and supposed to hint sarcastically at the worldly wisdom of its inhabitants.

Niagara Falls, N. Y. Power City, since the falls generate tremendous electric power.

Padua, Italy. The Learned City. For many centuries the seat of a great university.

Paris, France. City of the Lily, or City of Louis.

Pernambuco, Brazil. City of the Reef; the harbor is protected by an extensive reef of rocks.

Perth, Scotland. The Fair City, because elegantly built and picturesquely situated.

Philadelphia, Pa. (1) City of Brotherly Love, from the meaning of the name. (2) Quaker City, planned and colonized by William Penn and other members of the Society of Friends. (3) City of Homes.

Pittsburgh, Pa. (1) Iron City, from the extent of its iron manufactures. (2) Smoky City, from the smoke which overhangs it.

Portland, Me. Forest City, from the number of trees lining its streets.

Portland, Ore. The Rose City, from its beautiful rose gardens.

Quebec, Quebec. Gibraltar of America, after the heights on which the city is founded.

Rochester, N. Y. (1) Flower City, from the profusion of flowers and extensive nurseries there. (2) Kodak City, from the manufacture of photographic cameras there.

Rome, Italy. (1) Holy City. (2) City of Seven Hills. (3) Mistress of the World. (4) Imperial City. (5) City of Palaces. (6) Eternal City.

San Francisco, Cal. City of the Golden Gate.

Santa Fe, N. M. City of the Holy Faith.

Salt Lake City, Utah. City of the Saints; here is located the headquarters of the Mormon hierarchy, the Church of Latter-Day Saints of Jesus Christ.

Savannah, Ga. Garden City, from its parks and gardens.

Seattle, Wash. Queen City of Puget Sound.

Seven Cities, The. Egypt, Jerusalem, Babylon, Athens, Rome, Constantinople, and either London or Paris. They are often grouped under this title, as embodying wealth, antiquity, greatness and magnificence.

Springfield, Mass. City of Homes.

Springfield, Ohio. Flower City, from the beauty of its flowers.

St. Louis, Mo. Mound City, from the artificial mounds found there.

Stockholm, Sweden. Venice of the North, from the many islands and waterways.

Thessalonika (Modern Salonica), Greece. Orthodox City. It was for centuries a bulwark of Christianity, but in 1430 was captured by Amurath II.

Venice, Italy. (1) City of St. Mark. (2) City of the Seventy Isles.

Washington, D. C. (1) City of Magnificent Distances, from its being laid out on a large and regular scale. (2) Federal City.

Worcester, Mass. The Faithful City, so called from its motto: *Floreat Semper Civitas Fidelis.*

COAL

Coal is a black mineral substance, consisting largely of carbon, the remainder being hydrogen, oxygen, nitrogen and the earthy impurities that form the ash when coal is burned. Living vegetation that died and was buried in swampy lands some millions of years ago forms the coal of today. Water protected the fernlike trees that fell in that far-off time so that the air could not reach them and gradually a chemical change turned the wood into peat. Then sand and mud filtered in with great floods of water so that the peat was buried at the bottom of lakes and rivers where, pressed closer by the weight above, and further cut off from the action of the air, the peat turned into coal. When the proportion of carbon is about ninety per cent, coal is called "hard" or "anthracite." A sixty to seventy per cent carbon content is found in "soft" or "bituminous" coal. Semi-anthracite has a content of carbon between these two, and "lignite" is imperfectly carbonized vegetable matter with less than sixty per cent of carbon, yet more inflammable than peat.

More than half the known coal beds of the world lie within the United States. North America, Asia and Europe are the chief sources of the world's coal, and South Africa, Australia and New Zealand have considerable deposits. Chile and Argentina are the only countries in South America mining any great amount of coal. (Further information may be found by consulting the index. Also see illustrations of coal mining on page 327.)

Coal produces a large number of valuable by-products, the chief of which are illuminating and heating gas, coke, coal tar and ammonia. Coke and coal tar also produce by-products so that coal is the basic source of many dyes, scents, explosives, saccharine, carbolic acid, salicylic acid, coumarin (a vanilla flavoring substitute), creosote oils, naphthalene, and all the numerous bakelite products.

COKE

Coke, a by-product of coal, consists mainly of carbon, burns with a pure, steady flame that is free from smoke and gives off intense heat. It is used in smelting ores and in other industries where great heat is required. When coke is to be made, coal is washed, sorted by size and placed in the coke ovens. In modern plants this work is done by machinery. The old-style beehive oven with a cone-shaped top through which the gases escaped is being largely replaced by the by-product oven which collects the coal tar, ammonia and other by-products thrown off by the charring coal. Even the yield of coke is less in a beehive oven than in the newer type. Much coke is obtained as a by-product during the manufacture of illuminating gas. About a third of the coke produced in the United States comes from Pennsylvania.

COLOR COMBINATIONS

The question of harmony or inharmony of colors is constantly encountered in interior decoration, in dress, in ornamentation and in other avenues. The chart below indicates the results secured by combining certain colors. A fairly exact description of a color is required, hence the use of such terms as "peacock" blue or "sky" blue, "night" green or "olive" green. The use of "strong" indicates an excellent combining result.

CHART OF COLOR COMBINATIONS

	Buff	Chocolate Brown	Emerald Green	Gray	Grass Green	Lavender	Magenta	Maroon	Navy Blue	Night Green	Olive Green	Orange	Orchid	Peacock Blue	Poppy Red	Powder Blue	Purple	Salmon	Sky Blue	Tan	Topaz	Yellow
Buff		Good	Good	Bad	Good	Good	Good	Good	Good	Good	Good	Good	Good	Good	Good	Good	Good	Good	Good	Bad	Bad	Bad
Chocolate Brown	Good		Fair	Fair	Fair	Bad	Bad	Bad	Good	Fair	Good	Bad	Bad	Good	Bad	Good	Fair	Bad	Good	Bad	Bad	Bad

COMPASS

An instrument for indicating direction. A compass may be made by attaching a magnetized needle to a small portion of wood or cork and placing this in water. The needle will quickly come to rest pointing north and south.

The compass is important in the navigation of ships. Previous to the invention of the compass, navigators had only the stars to guide them. The compass was first used in the thirteenth century; it was made of a magnetized needle attached to a piece of wood and floated on water. The use of an improved compass made it possible for Columbus to sail across the Atlantic to America.

The mariner's compass is a highly improved device wherein several needles are permanently fastened to the lower surface of a round sheet of mica or paper. Set into the center of the paper is usually a small piece of agate which rests on a sharp metallic point enabling the card to turn easily. A copper ring or large glass-covered bowl contains the needles and cards. The bowl may be filled with a water and alcohol mixture in order to help support the card. Two rings of copper support this compass in such a way that it may easily shift in any direction with the roll of the ship. The mariner's compass is located in front of the steersman.

In addition to the magnetic compass, there is the gyroscopic type, or gyrocompass, invented in 1910 by E. A. Sperry. It is valuable in navigating ships made largely of steel which have a disturbing effect upon the magnetic compass. The gyrocompass has been installed in a high percentage of the steel ships. The underlying principle of the gyrocompass is based upon the rotation of the earth and that physical quality of a rapidly turning body to maintain a definite direction in relation to the earth. This type of compass consists of a heavy wheel which whirls easily and turns vertically or horizontally. The wheel is placed in a vacuum tube and turned by a motor at a rate of about 9,000 revolutions a minute. The gyroscope establishes a north and south direction and continues to do so as long as the wheel is kept turning at an even rate of speed. The compass card indicates the direction.

Inasmuch as the magnetic poles do not coincide exactly with our north and south poles, the reading of the magnetic compass is not correct and has to be adjusted by scientific calculations. The north magnetic pole is located about 70 degrees north latitude and 97 degrees west longitude. The south magnetic pole is located about 72 degrees south latitude and 153 degrees east longitude. The north and south magnetic poles change their position slightly at certain times. When placed in a torpedo a gyroscope causes the torpedo to go in a straight direction through the waves. The gyroscope is used to stabilize ships in a stormy sea and to keep the monorail car upright even when going around curves.

If a gyroscope is turned on its side, with support at only one end, it will not fall, but seemingly contrary to the laws of gravity will move in a horizontal circle, about the point of its support. This motion is called "precession," and in direction is opposite to that in which the wheel is rotating. The earth forms a fine example of a gyroscope, turning on its axis and at the same time revolving around the sun.

Aircraft compasses are especially designed to resist engine vibrations. A sun-compass, devised in 1925 by Albert H. Bumstead, is much used by aircraft navigators.

CONGRESSIONAL GOLD MEDALS

These medals are awarded by a special act of Congress for outstanding service to the United States or to mankind in general. Over 1,800 Congressional medals have been awarded, among them being the following:

Recipient	*Occasion of Award*	*Date*
George Washington.	The Capture of Boston.	1776
Horatio Gates.	Surrender of the British Army.	1777
Anthony Wayne.	Capture of Stony Point.	1779
François L. T. de Fleury (Silver Medal).	Capture of Stony Point.	1779
Henry Lee.	Surprise of Pawlus Hook.	1779
John Paulding, David Williams, Isaac Van Wart (Silver Medal).	Capture of Major Andre.	1780
Daniel Morgan.	Victory of Cowpens.	1781
William A. Washington (Silver Medal).	Victory of Cowpens.	1781
John Eager Howard (Silver Medal).	Victory of Cowpens.	1781
John Paul Jones.	Capture of *Serapis*.	1787
George Washington.	First President of the United States.	1787
John Adams.	Second President of the United States.	1787
Thomas Truxton.	Action with the *Vengeance*.	1800
Thomas Jefferson.	President of the United States.	1800
Edward Preble.	Naval operations against Tripoli.	1805
James Madison.	President of the United States.	1805
Isaac Hull.	Capture of the *Guerriere*.	1813
Jacob Jones.	Capture of the *Frolic*.	1813
Stephen Decatur.	Capture of the *Macedonian*.	1813
William Bainbridge.	Capture of the *Java*.	1813
Oliver H. Perry.	Battle on Lake Erie.	1814
Jesse Duncan Elliott.	Battle on Lake Erie.	1814
James Lawrence (Nearest relative).	Capture of the *Peacock*.	1814
Thomas Macdonough.	Victory of Lake Champlain.	1814
Robert Henley.	Victory of Lake Champlain.	1814
Stephen Cassin.	Victory of Lake Champlain.	1814
Lewis Warrington.	Capture of the *Epervier*.	1814
Johnston Blakeley.	Capture of the *Reindeer*.	1814
Jacob Brown.	Victories of Chippewa, Niagara and Erie.	1814
Peter Buel Porter.	Victories of Chippewa, Niagara and Erie.	1814
Eleazer Wheelock Ripley.	Victories of Chippewa, Niagara and Erie.	1814
James Miller.	Victories of Chippewa, Niagara and Erie.	1814
Winfield Scott.	Victories of Chippewa, Niagara and Erie.	1814
Edmund P. Gaines.	Victory of Erie.	1814
Alexander Macomb.	Victory of Plattsburg.	1814
Andrew Jackson.	Victory of New Orleans.	1815
Charles Stewart.	Capture of the *Cyane* and of the *Levant*.	1816
James Biddle.	Capture of the *Penguin*.	1816
James Monroe.	President of the United States.	1816
William Henry Harrison.	Victory of the Thames.	1818
John Quincy Adams.	President of the United States.	1818
Andrew Jackson.	President of the United States.	1818
George Croghan.	Defence of Fort Stephenson.	1835
Martin Van Buren.	President of the United States.	1835
John Tyler.	President of the United States.	1835
John Knox Polk.	President of the United States.	1835
Zachary Taylor.	Victories on the Rio Grande.	1846
Zachary Taylor.	Capture of Monterey.	1847
Winfield Scott.	Mexican Campaign.	1848
Zachary Taylor.	Victory of Buena Vista.	1848
Zachary Taylor.	President of the United States.	1848
Millard Fillmore.	President of the United States.	1848
Franklin Pierce.	President of the United States.	1848
Duncan N. Ingraham.	Release of Martin Koszta.	1854
James Buchanan.	President of the United States.	1854
Frederick Henry Rose.	Kindness and humanity. (Dr. Rose was a British subject who by permission of his commander boarded a United States war vessel that had been visited by an epidemic of yellow fever and took care of the sick).	1758
Abraham Lincoln.	President of the United States.	1858
Ulysses S. Grant.	Victories of Fort Donelson, Vicksburg and Chattanooga.	1863
Cornelius Vanderbilt.	Free gift of steamship *Vanderbilt*.	1864
Andrew Johnson.	President of the United States.	1864
Cyrus West Field.	Laying of the Atlantic Cable.	1867
George Peabody.	Promotion of industrial education.	1867
Ulysses S. Grant.	President of the United States.	1867
George Foster Robinson.	For saving the life of William H. Seward, Secretary of State, on April 14, 1865, when he was attacked by the assassin Payne, one of the conspirators against Lincoln and his cabinet.	1871
John Horn, Jr.	For saving over one hundred people from drowning on various occasions.	1874
J. S. Crandall and others.	For rescuing the passengers and crew of the steamer *Metis* off Watch Hill, R. I.	1874
Joseph Francis.	For life-saving appliance.	1888
David H. Jarvis, Ellsworth P. Bertholf, Samuel J. Call.	In recognition of the heroic services rendered by them in connection with the expedition of 1879-1898, for the relief of the whaling fleet in the Arctic regions.	1902
Orville Wright and Wilbur Wright.	For services rendered the science of aerial navigation.	1909
Capt. Arthur Henry Rostron.	For service in giving relief to passengers of the wrecked steamship, *Titanic*.	1912
Kroonland, officers and crew.	Relief of *Volturno*.	1914
Señors de Gama, Noan and Suarez.	Mediation between U. S. and warring parties in Mexico.	1915
Maj. John O. Skinner (Medal of Honor).	Gallantry during Modoc Indian campaign of 1873.	1915
Unidentified British and French soldiers in Westminster Abbey and Arc de Triomphe.		1921
Robert Edward Cox, Chief Gunner, U.S.N.	Heroism at accident on U.S.S. *Missouri*, 1904.	1921
Unidentified American soldier in Arlington Cemetery.	(Congressional Medal of Honor and Distinguished Service Cross).	1921
Unidentified Italian soldier in Rome.		1921
Army World Flyers—Major Fred L. Martin, Captain Lowell H. Smith, Lieutenants Leigh Wade, Leslie Arnold and Erik Nelson, and Sergeant Alva L. Harvey.	(Distinguished Service Medals).	1925
Richard E. Byrd, Rear-Admiral U.S.N., retired.	North Pole flight by aircraft.	1927
Floyd Bennett, aviation pilot, U.S.N.	Services in Byrd Arctic Expedition.	1927
Col. Chas. A. Lindbergh, U.S.A. C.R.	New York-Paris flight.	1927
Thomas Eadie.	Saved companion diver, risking his own life over two hours to do so.	1927
Col. De Pinedo, Coste, Le Brix, von Huenefeld, Fitzmaurice and Koehl.	(Distinguished Flying Cross.) Several aircraft flights.	1928
Thomas A. Edison.	In recognition of achievements.	1928
Commander John H. Towers and crew of *NC-4*.	Transatlantic flight of 1919.	1929
Walter Reed, James Carroll and twenty others.	Services in yellow fever investigations in Cuba.	1929
Lieut. Deming Bronson.	Gallantry in action, Eclisfontaine, France.	1929
Michael Valente (private).	Capture of two machine gun nests, Ronssoy, France.	1929
Col. Edward D. Rickenbacker.	Attack on seven airplanes and destruction of two of them at Billy, France.	1929
Christian F. Schilt.	Saved three lives and carried aid by airplane at Quilali, Nicaragua.	1930

CONTINENTAL CONGRESS, PRESIDENTS OF

Fourteen men served as President of the Continental Congress, Peyton Randolph being chosen in 1774 and again the following year.

Peyton Randolph, Virginia	1774
Henry Middleton, South Carolina	1774
Peyton Randolph, Virginia	1775
John Hancock, Massachusetts	1776

Henry Laurens, South Carolina 1777
John Jay, New York 1778
Samuel Huntington, Connecticut 1779
Thomas McKean, Delaware 1781
John Hanson, Maryland 1781
Elias Boudinot, New Jersey 1782
Thomas Mifflin, Pennsylvania 1783
Richard Henry Lee, Virginia 1784
Nathaniel Gorham, Massachusetts 1786
Arthur St. Clair, Pennsylvania 1787
Cyrus Griffin, Virginia 1788

COPYRIGHT

Copyright is a form of protection granted to authors, publishers, and others who create books, periodicals, plays, works of art and lectures. Photographs are submitted when applying for copyright of a statue; the material submitted for copyright of a motion picture includes a photograph and title taken from each scene of a play. The Copyright Office at Washington, D.C., handles all copyrights for the United States. Copyright is for twenty-eight years, with renewal for a similar period, making fifty-six years in all, and may be secured by the author, his family or executors in case of his death, or by anyone to whom the copyright has been assigned. Until the international copyright law is effective American authors must secure foreign copyrights for protection in the various countries, and foreign authors, even though their works are copyright elsewhere, must take out copyright in the United States to obtain American protection.

In 1928, delegates of thirty nations met in Rome and signed a proposed international copyright law that will automatically copyright a work in all these countries when properly copyrighted in one. Each country is left free to support a copyright office where works can be registered for the purpose of establishing priority, but the international law provides that the work of writers and musicians becomes automatically copyright from the moment it is set down on paper. This law forms the basis of the Copyright Union which will become effective when proper legislation is passed in each country.

CRESCENT

According to tradition, "Philip, father of Alexander, meeting with great difficulties in the siege of Byzantium, set the workmen to undermine the walls, but a crescent moon discovered the design, which miscarried; consequently the Byzantines erected a statue to Diana, and the crescent became the symbol of the state." By another legend, Othman, the sultan, saw in a vision a crescent moon, which grew until it reached from east to west, whereupon he adopted the crescent for his standard.

DATE LINE, INTERNATIONAL

The International Date Line is an imaginary line approximately at the 180th meridian, at which dates change; later by one day for those who cross the line from east to west; and earlier by one day for those crossing it from west to east. It is a somewhat irregular line drawn through the Pacific Ocean in a north and south direction, separating the islands of the Pacific in such a manner that all those lying to the east of it carry the same date as the United States while those west of it carry the same date as Japan and Australia. The date on the American side of the line is a day behind that on the Asiatic side of the International Date Line.

The International Date Line has not been universally accepted for change of time. Changes are known to have been made in Alaska, the Philippines and other places. When the Russians first colonized Alaska they conformed to the Russian date line. When the Americans migrated there, considerable confusion resulted, as each race carried its own date and the Sunday of the Americans was the Monday of the Russians. However, when Alaska was purchased from Russia in 1867 the date in use there was made to conform to that used in the United States.

DEATH SENTENCE PASSED UPON JESUS CHRIST

The following is a copy of the most memorable judicial sentence which has ever been pronounced in the annals of the world, that of death against Jesus Christ, the knowledge of which must be interesting in the highest degree to every Christian. The sentence reads:

SENTENCE PRONOUNCED BY PONTIUS PILATE, INTENDANT OF THE PROVINCE OF LOWER GALILEE, THAT JESUS OF NAZARETH SHALL SUFFER DEATH BY THE CROSS. IN THE SEVENTEENTH YEAR OF THE REIGN OF THE EMPEROR TIBERIUS AND ON THE 25TH OF THE MONTH OF MARCH, IN THE MOST HOLY CITY OF JERUSALEM, DURING THE PONTIFICATE OF ANNAS AND CAIAPHAS, PONTIUS PILATE, INTENDANT OF THE PROVINCE OF LOWER GALILEE, SITTING IN JUDGMENT IN THE PRESIDENTIAL SEAT OF THE PRAETORS, SENTENCES JESUS CHRIST OF NAZARETH TO DEATH ON A CROSS BETWEEN TWO ROBBERS, AS THE NUMEROUS AND NOTORIOUS TESTIMONIALS OF THE PEOPLE PROVE: (1) JESUS IS A MISLEADER. (2) HE HAS EXCITED THE PEOPLE TO SEDITION. (3) HE IS AN ENEMY TO THE LAWS. (4) HE CALLS HIMSELF THE SON OF GOD. (5) HE CALLS HIMSELF FALSELY THE KING OF ISRAEL. (6) HE WENT INTO THE TEMPLE FOLLOWED BY A MULTITUDE CARRYING PALMS IN THEIR HANDS. ORDERS: THE FIRST CENTURION, QUINTUS CORNELIUS, TO BRING HIM TO THE PLACE OF EXECUTION, FORBIDS ALL PERSONS, RICH OR POOR, TO PREVENT THE EXECUTION OF JESUS.

The sentence is engraved on a plate of brass in the Hebrew language, and on its sides are the following words: "A similar plate has been sent to each tribe." It was discovered in the year 1280 in the city of Aquill (Aquilla) in the kingdom of Naples, in a search made for the discovery of Roman antiquities, and remained there until it was found by the Commissaries of Art in the French army of Italy. Up to the time of the campaign in southern Italy it was preserved in the sacristy of the Carthusians, near Naples, where it was kept in a box of ebony. Since then the relic has been kept in the Chapel of Caserta. The Carthusians obtained permission to keep the plate as an acknowledgment of the sacrifices which they made for the French army. The French translation was made literally by members of the Commission of Arts.

DAMS, NOTED MODERN

Dams to control water flow are constructed for purposes of irrigation, to supply cities and towns with water, to aid navigation and to supply power. The following list embraces most of the important larger modern dams, together with their location and size.

NAME, LOCATION AND DATE OPENED	HEIGHT, FEET	LENGTH, FEET	STORAGE CAPACITY, MILLION GALLONS
United States			
American Falls, Idaho, Snake River, 1927	78	4,971	553,946

DEW

Dew is moisture condensed from the atmosphere upon the surface of certain bodies. The higher the temperature the more water vapor the atmosphere can retain in solution. The diminution, therefore, of heat, which takes place when day is succeeded by night, in many cases renders the air incapable of retaining some of the moisture which it held in the form of vapor during the day. This is deposited on any bodies which at the time are colder than the adjacent atmosphere. It scarcely ever happens that the air is saturated with vapor, or, as it is more correctly worded, that the water vapor is in the condition of greatest possible density for the temperature. As Aristotle long ago observed, dew is deposited chiefly on calm nights. It is more plentiful in spring and autumn than in summer. A cloudy night inteferes with the condensation, for the clouds intercept radiation from the earth, and, in many cases, prevent the temperature falling to the dew point. Dew when congealed becomes hoarfrost.

DIXIE

A name popularly applied to the states south of Mason and Dixon's line. Also, in folklore, a fabulous realm of peace, plenty and indolence, whose charms form the burden of many a negro melody. Brewer says that a Mr. Dixie was a slaveholder of Manhattan Island, compelled by public opinion to remove his human chattels to the South. In their new abode they had to toil ceaselessly, and often sighed for their old home in the North, which lapse of time and distance invested with a halo of paradisaic pleasures. This "Dixie Land" became to the entire colored race in the South a species of Utopia, similar to the Scottish "Land 'o the Leal" or the Fortunate Islands of the ancients.

The song, "Dixie," composed in 1859 by Dan D. Emmett, is one of the most popular of American songs.

DOE, JOHN AND ROE, RICHARD

Formerly, two well-known names representing a species of legal fiction. They originated in the custom, on arresting a person, of finding two sureties who were bound over in heavy penalties that the pursuer should prove the justice and the legality of his claim; otherwise, the pursued should receive indemnity from the parties thus bound over. This custom, however, in process of time, degenerated into the mere nominal recognizances or sureties of "John Doe and Richard Doe." In 1852, these two celebrated characters ceased to have any legal existence.

DOLLAR MARK

Writers are not agreed as to the derivation of the sign ($) to represent dollars. Some say it comes from the letters U.S., which after the adoption of the federal Constitution, were prefixed to the federal currency, and which afterward, in the hurry of writing, were run into one another, the U being made first and the S over it. The more probable explanation is that it is a modification of the figure eight, and denotes a piece of eight reals or the dollar which was formerly divided into eight parts and designated by the figures 8-8.

DOMES OF FAMOUS BUILDINGS

Name	Diameter Feet	Height Feet
Pantheon, Rome	142	143
Duomo, Florence	139	310
St. Peter's, Rome	139	330
Capitol, Washington, D. C.	135½	287½
St. Sophia, Constantinople	115	180
Baths of Caracalla (ancient), Rome	112	116
St. Paul's, London	112	215
Mosque of Sultan Solyman, Constantinople	95	187
Les Invalides, Paris	92	350
Santa Maria della Salute, Venice	80	133
Escorial, Madrid	60	320
Santa Maria della Consolazione Todi, Italy	50	180

DRACONIAN LAWS

In modern usage, statutes of unusual severity. The laws of Draco, enacted by him when archon of Athens (B. C. 621), on account of their rigor were said to be written in blood. This code was set aside by the laws of Solon, B. C. 594, which were founded on the principle of making property, not birth, the title to the honors and offices of the state.

DREAMS

A dream is a collection of ideas which come to the mind when one is asleep. When dreaming one does not have control over the trend of his thoughts, and the principle of suggestion is in control. The images that appear in dreams are usually completely lacking in coherency but sometimes the mind develops wonderful brilliancy during sleep. It is generally accepted that dreams result from natural causes. Internal bodily impression or the preceding state of mind or body usually cause and mold a dream. Dreams, therefore, look backward over time past, instead of anticipating the future; and yet throughout the world in all the ages, many people have interpreted dreams as prophesying future events.

EAGLE

The eagle is chosen to support the lectern, or reading-desk in churches because it is the natural enemy of the serpent. The Old and the New Testaments correspond to the outspread wings of the eagle. In royal banners it is the ensign of the ancient kings of Babylon and Persia, of the Ptolemies, Seleucides and Romans. The French under the empire adopted the same device. The two-headed eagle signifies a double empire, assumed by Austria, which claims to be the successor of the Caesars and Charlemagne; in 802 the second head was added to her standard, on the union of Rome and Germany. Czarist Russia, by virtue of uniting Poland to her possessions, adopted the same emblem. It was first used by Constantine. The golden eagle and the spread eagle descend from the Crusades, where they were first employed by the emperors of the East.

EARTHQUAKE

A quaking, vibratory, undulating, or other movement of a portion of the earth's crust produced by forces acting from beneath. Certain premonitory symptoms are believed to herald the approach of a great earthquake. These are said to be: irregularities in the seasons, sudden gusts of wind interrupted by dead calms; violent rains at unusual seasons, or in countries where they rarely occur; a reddening of the sun's disc and a heaviness in

DIAMONDS OF NOTE

Carats (Uncut)	Carats (Cut)	Name	Discovered	Possessor
	516½	Cullinan I (also called Star of South Africa)†	1905	King George V of England.
3106*	309⅜ and over 100 smaller stones.	Cullinan II	1905	
1680	Never cut	Braganza	1741	Republic of Portugal.
971	Cut into 10 pieces, 69 to 13 each.	Excelsior	1893	Sold privately.
787½	367.9	Rajah of Mattan	1756	Rajah of Mattan (Borneo).
787½	279 9/16	Great Mogul	1650	Probably lost.
650	245‡	Jubilee	1896	Great Britain. Used at Queen Victoria's Jubilee.
	199.6	Orloff		Diamond Treasure of the Union of Soviet Republics.
410	143.2	Pitt or Regent	1701	Louvre, Paris.
150	138½		1775	Republic of Portugal.
	137.25	Florentine (cinnamon-colored)	before 1657	Austrian Government.
242½		Tavernier	1668	Stolen in 1792.
254	128.5§	Star of the South (a Brazilian Diamond)	1853	Gaekwar of Baroda, India.
	128.5	Tiffany Yellow	1878	Tiffany and Co., New York.
296	123	Stewart	1872	English private ownership.
119½		English Dresden	1857	Gaekwar of Baroda.
186½	106.1	Kohinoor	B.C.	Jewel Room, Tower of London.
	88.7	Shah of Persia	before 1591	Diamond Treasure of the Union of Soviet Republics.
	85.8	Pigot	before 1775	Destroyed, 1882.
89½	78⅝	Nassac		Marquis of Westminster last known owner.
288⅝		Light Yellow		Stewart (diamond).
150		Porter Rhodes, found in South America	1872	
83	55	Sancy	about 1570	Maharajah of Patiala (Farrington, Lady Astor (Kunz).
	51	Empress Eugenie		Gaekwar of Baroda, India.
	49.8	Dresden Green	before 1743	Green Vaults, (Grüne Gewölbe) Dresden.
83½	46½	Star of South Africa or Dudley	1867	Countess of Dudley.
112¼	45.5‖	Hope Blue		Mr. Edw. B. McLean, Washington, D. C.
	40	Pacha of Egypt		Egyptian Government.
	40	Polar Star		Diamond Treasure of the Union of Soviet Republics (?).
	26	Star of Este		Archduke Franz Ferdinand of Austria-Este (Assassinated 1914).

*Oliver C. Farrington, *Famous Diamonds*, Chicago, 1929. Geo. F. Kunz gives 3,024.
†As christened by King George V of England. ‡Kunz gives 239 carats. §Kunz gives 254 carats.
‖Kunz gives 41¼ carats.

the air continuing, it may be, for months; an evolution from the soil of electric matter, inflammable gas, with sulphurous and mephitic vapors; subterranean noises like those of artillery or thunder; cries of distress emitted by animals; and drowsiness with a feeling of seasickness in men.

When the fatal moment arrives, the ground at some spot is heaved upward, and becomes the center of vibrations or undulations, somewhat like those produced by the ripple wave propagated in a continually enlarging circle around the spot where a pebble has been cast into a pond. The earth swells and heaves like a rolling sea; cracks and rents are produced in all directions. Great funnel-like holes yawn open. New lakes are formed. Houses and other buildings may, with their inhabitants, be destroyed over the greater part of a city in a few moments, though it is a suggestive fact that this destruction is often limited to those built on one geological stratum. Precipitous cliffs fall into adjacent seas or rivers, in the latter case more or less damming them up and producing floods. Landslips take place with similar consequences. The sea becomes agitated, and after first receding from the land, rolls in upon it with a wave of enormous height. This is more especially the case if the focus of agitation be beneath the sea. The sensation on board ship when an earthquake occurs is as if the vessel had struck a rock.

There are certain regions to which both the points of volcanic eruption and the movements of great earthquakes are confined. The two, therefore, have probably a common origin, as in steam and molten matter. These force an exit to the external atmosphere, generating a volcano, and the similar explosive materials still seeking for vent, produce an earthquake. Connected with the latter, as with the former, are such phenomena as the ejection from the ground of torrents of water discolored by mud, and emitting mephitic vapors which, if intense, are fatal to animal life. Not uncommonly an old volcano goes into eruption, or, more rarely, its upper part and crater fall in and a new one is generated in the midst of an earthquake. Great upheavals of land are normal earthquake effects, though in exceptional cases there are subsidences.

NOTABLE EARTHQUAKES

Location — *B. C.*

One which made Euboea an island — 425
Ellice and Bula, in Peloponnesus, swallowed up — 372
One at Rome, when, in obedience to an oracle, M. Curtius, armed and mounted on a stately horse, leaped into the dreadful chasm it occassioned. (*Livy*) — 358
Duras, in Greece, buried, with all its inhabitants; and twelve cities in Campania also buried — 345
Lysimachia and its inhabitants totally buried — 283

A. D.

Ephesus and other cities overturned — 17
One accompanied by the eruption of Vesuvius; the cities of Pompeii and Herculaneum buried — 79
Four cities in Asia, two in Greece, and two in Galatia overturned — 107
Antioch destroyed — 115
Nicomedia, Cæsarea and Nicæa overturned — 126
In Asia, Pontus and Macedonia, 150 cities and towns damaged — 357
Nicomedia again demolished, and its inhabitants buried in its ruins — 358
One felt by nearly the whole world — 543
At Constantinople; its edifices destroyed, and thousands perished — 557
In Africa; many cities overturned — 560
Syria, Palestine and Asia; more than 500 towns were destroyed and loss of life enormous — 742
In France, Germany and Italy — 801
Constantinople overturned; all Greece shaken — 936
One felt throughout England — 1089
One at Antioch; many towns destroyed, among them Mariseum and Mamistria — 1114
Catania, in Sicily, overturned, and 15,000 persons buried in the ruins — 1137
One severely felt at Lincoln — 1142
Calabria; one city and all its inhabitants overwhelmed in the Adriatic Sea — 1186
One again felt throughout England; Glastonbury destroyed — 1274
In England; the greatest known there — 1318
At Naples; 40,000 persons perished — 1456
At Lisbon; 1,500 houses and 30,000 persons buried in the ruins; several neighboring towns engulfed with their inhabitants — 1531
London; part of St. Paul's and the Temple churches fell — 1580
In Japan; several cities made ruins, and thousands perished — 1596
Terrible one at Calabria — 1638
In China, when 300,000 persons were buried in Pekin alone — 1662
One severely felt in Ireland — 1690
One at Jamaica, which totally destroyed Port Royal, whose houses were engulfed forty fathoms deep, and 300 persons perished — 1692
One in Sicily, which overturned fifty-four cities and towns, and 300 villages. Of Catania and its 18,000 inhabitants not a trace remained; more than 100,000 lives were lost — 1693
Palermo nearly destroyed; 6,000 lives lost — 1726
Again in China; and 100,000 people swallowed up at Pekin — 1731
In Hungary; a mountain turned round — 1736
One at Palermo, which swallowed up a convent; but the monks escaped — 1740
Lima and Callao demolished; 18,000 persons buried in the ruins — 1746
In London; a slight shock, February 8, but severer shock, March 8 — 1750
Adrianople nearly overwhelmed — 1752
At Cairo; half of the houses and 40,000 persons swallowed up — 1754
Quito destroyed — 1755
Great earthquake at Lisbon. In about eight minutes most of the houses and upward of 50,000 inhabitants were swallowed up, and whole streets buried. The cities of Coimbra, Oporto, St. Ubes and Braga suffered. In Spain, a large part of Malaga became ruins. One-half of Fez, in Morocco, was destroyed, and more than 12,000 Arabs perished there. About half of the Island of Madeira became waste; and 2,000 houses in the Island of Mytilene, in the Archipelago, were overthrown. This earthquake extended 5,000 miles; even to Scotland — 1755
In Syria, extended over 10,000 square miles; Baalbec destroyed — 1759
At Martinico, 1,600 persons lost their lives — 1767
At Guatemala, which, with 8,000 inhabitants, was swallowed up — 1773
A destructive one at Smyrna — 1778
At Tauris; 15,000 houses thrown down, and multitudes buried — 1780
Messina and other towns in Italy and Sicily overthrown; 40,000 persons perished — 1783
Archindschan wholly destroyed, and 12,000 persons buried in its ruins — 1784
At Borgo di San Sepolcro; many houses and 1,000 persons swallowed up — 1789
Another fatal one in Sicily — 1791
In Naples; Vesuvius overwhelmed the city of Torre del Greco — 1794
In Turkey, where, in three towns, 10,000 persons lost their lives — 1794
The whole country between Santa Fe and Panama destroyed, including Cuzco and Quito, Peru; 40,000 people buried in one second — 1797
At Constantinople, which destroyed the royal palace and many other buildings, and extended into Rumania and Wallachia — 1800
A violent one felt in Holland — 1804
Frosolone, Naples, 6,000 lives lost — 1805
At the Azores; a village of St. Michael's sunk, and a lake of boiling water appeared in its place — 1810
Awful one at Caracas — 1812
Several throughout India; district of Kutch sunk; 2,000 persons buried — 1819
Genoa, Palermo, Rome and many other towns damaged; thousands perished — 1819
Aleppo, Syria, 22,000 lives lost — 1822
One in Calabria and Sicily — 1826
In Spain; Mercia and numerous villages devastated; 6,000 persons perish — 1829
In the Duchy of Parma; no less than forty shocks were experienced at Borgotaro; and at Pontremoli many houses were destroyed — 1834
Calabria; Cosenza and villages destroyed; 1,000 persons buried — 1835
Calabria; 1,000 buried at Rossano, etc. — 1836
In many cities of Southern Syria, by which hundreds of houses were thrown down, and thousands of lives lost — 1836
Martinique; nearly half of Port Royal destroyed; nearly 700 persons killed, and the whole island damaged — 1839
Ternate; the island made a waste, and thousands of lives lost — 1840
Awful and destructive earthquake at Mount Ararat, in one of the districts of Armenia — 1840
Zante, where many persons perished — 1840
At Cape Haytien, Santo Domingo, destroyed nearly two-thirds of the town; between 4,000 and 5,000 lives were lost — 1842
Point à Pitrie, Guadaloupe destroyed — 1843
At Rhodes amd Macri, when a mountain fell in at the latter place, crushing a village, and destroying 600 persons — 1851
At Valparaiso, Chile; 400 houses destroyed — 1851
In South Italy; Melfi in ruins; 14,000 killed — 1851
In Philippine Islands; Manila nearly destroyed — 1852
Thebes, in Greece, nearly destroyed — 1853
St. Salvador, South America, destroyed — 1854
Amasca, and Simoda, Japan, destroyed; Jeddo much injured — 1854
Brusa, in Turkey, nearly destroyed — 1855
Several villages in Central Europe destroyed — 1855
Jeddo nearly destroyed — 1855
Moluccas, nearly 3,000 lives lost — 1856
In the Mediterranean; at Candia, 500 lives lost; Rhodes, 100; and other islands, 150 — 1856
Calabria, about 22,000 lives lost — 1857
Corinth nearly destroyed — 1858
Quito, Ecuador; 5,000 killed; great property loss — 1859
Erzerum, Asia Minor; above 1,000 persons said to have perished — 1859
At San Salvador; many buildings destroyed; no lives lost — 1859
Mendoza, Argentina; about two-thirds of the city and 7,000 lives lost — 1861
Greece; North Morea and Corinth injured — 1861
Peru and Ecuador; 25,000 lives lost — 1861
Guatemala; 150 buildings destroyed — 1862
Manila, P. I., great destruction of property — 1863
Cities of Arequipa, Iquique, Tacna and Chincha, and many small towns in Peru and Ecuador destroyed; about 25,000 perished — 1868
Cities in Guatemala destroyed — 1874
Manila; Philippine Islands, 3,000 lives lost — 1880
Java and neighboring isles desolated — 1883
Several Spanish towns destroyed — 1884
Province of Granada, Spain; 690 perished — 1885
Charleston, S. C., 41 lives and $5,000,000 worth of property lost — 1886
Severe shock in southern Europe, especially in the Riviera; estimated that 2,000 perished — 1887
Japan; 4,000 perished, 50,000 houses destroyed — 1891
Islands of Zante and Stromboli; great loss of lives and property at Zante — 1893
Japan; 27,000 lives lost, 60,000 homeless — 1896
Assam, India; many killed — 1897
Monte Pelée, Martinique, W. I.; 30,000 lives lost — 1902
Northern India, over 1,600,000 square miles affected, 20,000 lives lost — 1905
Chile, especially Valpariso and Santiago; 5,000 lives and $100,000,000 property lost — 1906
Severe shocks in California, San Francisco wrecked. Greatest fire in history, lasting two days. $400,000,000 property destroyed; 300,000 homeless; April 18 — 1906
Large part of Kingston, Jamaica, destroyed — 1907
Turkestan; 14,000 lives lost — 1907
Sicily and Calabria; Messina and Reggio destroyed; 96,000 dead; 1,000,000 homeless — 1908
Cartago, Costa Rica; 1,500 lives lost — 1910
Guadalajara, Mexico; great part of city destroyed — 1912
Turkey; 3,000 lives lost, 6,000 persons injured, 40,000 homeless — 1912
Sakura, Japan; 43 killed, 855 houses destroyed — 1914
Sicily; 200 killed, 1,000 injured — 1914
Central Italy; 29,978 killed. Avezzana destroyed, 372 communes damaged — 1915
Guatemala, Guatemala; 2,500 killed — 1917
Porto Rico; 100 killed — 1919
Java, Dutch East Indies; Mt. Kalut, 5,000 killed — 1919
San Salvador, Salvador; nearly all the city's houses destroyed — 1919
Mugello Valley, Italy; 100 killed — 1919
Giarre and other towns in Sicily destroyed — 1920
Kansu province, China; 100,000 killed; 10 cities destroyed — 1920
Mendoza province, Argentina; 100 killed in city of La Valle — 1920
Orizaba district, Mexico; 3,000 killed — 1920
Southern Albania; 42 killed — 1920
Elbasan, Albania; 14 killed — 1921
Chile; 900 killed. Copiapo partly destroyed; Oralle, Coquimbo, Vallena, Chanaral and San Fernando damaged — 1922
Chile; 1,800 killed — 1923
Japan, Tokio and Yokohama destroyed. Dead 200,000; injured 125,000; missing 235,000; homeless 2,000,000. 634,000 houses destroyed, including the Library of the Imperial University, with library of 700,000 volumes. Money loss of $933,000,000. — 1923
San José, Costa Rica, partly destroyed — 1924
Santa Barbara, California, partly destroyed — 1925
Island of Rhodes, in the Aegean Sea, 200 houses destroyed — 1926
Managua and Leon, Nicaragua, partly destroyed — 1926
Central Japan, 2,500 killed — 1927
Palestine and Transjordania, hundreds killed — 1927
Namangan, Turkestan, 106 casualties; 4,850 houses destroyed — 1927
Messina, Greece; 200 houses destroyed — 1927
Lanchau, District of Kansu, China; 500,000 killed — 1927
Philippopolis, Papazli and Tchirpan in Bulgaria; 153 killed; enormous property loss — 1928
Southern Italy, centering in the village of Melfi; approximately 3,000 killed; over 4,000 injured — 1930
Ancona, Senigallia and Pesaro in Italy; 21 killed; property loss, $15,000,000 — 1930
Managua in Nicaragua; 2,000 killed; $20,000,000 property loss — 1931

ECHO

The repetition of a sound in the air, caused by reflection from an obstacle is an echo. A very sharp, quick sound can produce an echo when reflecting surface is fifty-five feet distant. At 112.5 feet monosyllables can be reflected; at twice that distance dissyllables; at three times as far off trisyllables; and so on for greater distances.

EDIBLE BIRDS' NESTS

Edible nests are made by various species of small swifts inhabiting the mainland of Asia, the Philippine Islands, numerous islands in the Indian Ocean, and a few islands in the Pacific. These nests, which are usually attached to cliffs or the walls of caves, are composed almost entirely of the dried mucus secreted by the salivary glands of the birds. They are eagerly sought by epicures in China and several other countries as the chief ingredient of a kind of soup. Their value depends largely on their color and purity, for frequently they are mixed with feathers and other foreign substances. The dry glutinous substance resembles isinglass.

EXPECTATION OF LIFE

The following table is based on the records of births and deaths in the registration area of the United States. The figures show a lowering of the death rate over records of earlier years up to the age of thirty-seven, after that age little improvement in mortality rates was recorded.

Expectation of Life for Specified Ages in 1926, 1927 and 1928, United States Registration States as of 1920, Total Persons*.

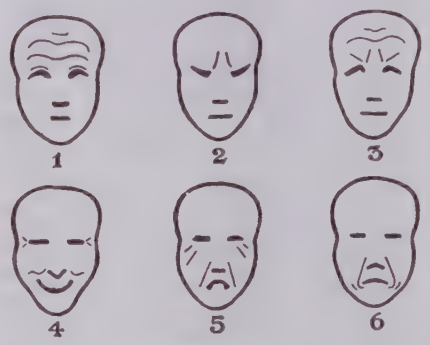
Age	1928	1927	1926
0	58.18	59.10	57.74
1	60.52	61.48	60.51
2	60.17	61.07	60.32
3	59.49	60.38	59.69
4	58.71	59.60	58.94
5	57.88	58.78	58.12
6	57.04	57.93	57.28
7	56.17	57.06	56.42
12	51.63	52.52	51.87
17	47.19	48.07	47.42
22	43.01	43.86	43.27
27	38.89	39.71	39.16
32	34.74	35.56	35.03
37	30.67	31.47	30.97
42	26.74	27.51	27.04
47	22.96	23.68	23.24
52	19.32	19.99	19.57
57	15.95	16.57	16.17
62	12.82	13.39	13.00
67	10.06	10.60	10.23
72	7.82	8.33	7.95
77	5.93	6.36	5.96
82	4.44	4.82	4.45
87	3.34	3.66	3.38
92	2.51	2.76	2.55
97	2.07	2.17	2.10
102	1.65	1.69	1.68

*Both sexes, white and colored population.

EXPLOSIVES

While the early uses of explosives were mainly those of warfare, they have many modern industrial uses also. In mining, rock blasting, uprooting of tree stumps and in destroying ice and other barriers that threaten safety, explosives do the work of hundreds of men, and do it quickly. The chief explosives are:

(1) Mixtures of a combustible but non-explosive material with an oxidizing agent, especially a nitrate and a chlorate, as in ordinary gunpowder and blasting powders. The usual formula for gunpowder is 70 to 80 per cent of saltpeter with 20 to 30 per cent of charcoal and sulphur.



(2) Cotton soaked in a mixture of strong nitric and sulphuric acids forms guncotton. This, mixed with other ingredients, notably nitroglycerin, makes the smokeless powder that has so largely superseded gunpowder for use in firearms.

(3) Nitroglycerin absorbed in kiselguhr, sawdust, charcoal or other porous material to form dynamite. Dynamites containing a nitro substitution product or mixture, such as lyddite, capable of taking part in the explosion, are safer than nitroglycerin, being less liable to explode as the result of minor shocks.

(4) Fulminating powders, such as fulminate of mercury, used as detonators. These explosives have practically instantaneous action and are used largely as signals.

(5) Sprengel explosives, named after their inventor, are high explosives formed by mixing, just before use, an oxidizing and a combustible ingredient, neither of which alone is explosive. Among these are rackarock and hellhofite.

Gunpowder, the first explosive in common use, is said to have been invented at an early period by the Chinese, later being taken to Europe, where its use was common in the fourteenth century.

Facial Expressions

With a few lines, the artist has depicted: (1) Astonishment, (2) Reflection, (3) Pain, (4) Mirth, (5) Sorrow, (6) Contempt.

FACIAL EXPRESSION

Facial expression depends on muscular action as well as on the way the face is constructed. The muscles, like the brain and nerves, are developed by exercise. Character shows in the face, for thoughts influence the muscles into characteristic action. Muscles that draw up the corners of the mouth make for a happy expression; a drooping mouth shows temper or discouragement, as does also a furrowed brow. Controlling the thoughts helps the muscles express the character one desires to have, but this works the other way in some degree, and people who cultivate a pleasant expression find it easier to carry thoughts of a pleasant nature. Try to smile and still keep gloomy thoughts and it will be found that the muscles influence thought in no little degree.

FIRE

When the union of oxygen with some other element takes place slowly, heat is made, but no fire or light is visible; when the union takes place quickly, both heat is felt and fire or flame is seen. When iron rusts it is the same kind of burning as when wood blazes in the fire; but the oxygen of the air unites with the iron so slowly that the heat is not enough to be felt. If the union be made to take place quickly, heat will be felt and light will be seen. When the nails on the heel of a shoe strike a stone, one often sees a spark fly. This is burning iron. The iron nail in the heel of the shoe strikes the stone, a bit of it is knocked off, and heat enough is made by the blow to cause the iron to unite with the oxygen of the air, and thus it may be seen to burn. A piece of iron or steel may easily be heated enough to make it burn in a jar of oxygen, and a most brilliant light will be given off by it. When wood or coal is set on fire, it gives out both heat and light; but if it could be given still more oxygen it would burn still brighter. This happens when one blows a fire with the bellows, and this is the reason why it then blazes up and burns more briskly. Some things take fire—that is, unite with oxygen—much more easily than others. When one scratches a match it at once bursts into flame.

The match has a little phosphorous on the end, which unites so readily with oxygen that the phosphorous has usually to be kept in water to prevent burning. The phosphorous on the end of the match is mixed with glue to prevent it from taking fire; but when the match is scratched on any rough surface, enough heat is caused for the phosphorous to unite quickly with the oxygen of the air and the top of the match bursts into flame.

Wood and coal have not so great a liking for oxygen as phosphorus, and it requires much more heat to make them ignite.

FIRES, GREAT AND HISTORIC

Fire has cost the world many beautiful buildings and historic records. Forest fires each year kill thousands of fine trees. In the United States the annual loss of human life by fire is about 15,000. The following list notes only the great fires since the earliest Christian times.

Rome, Italy, A. D. 64. Conflicting data on disaster.
London, England, Sept. 2-6, 1666. 89 churches, 13,200 houses destroyed; 400 streets laid waste; 200,000 persons homeless. Ruins covered 436 acres.
London, England, 1794. 650 houses destroyed, $5,000,000 loss.
Richmond, Va., Dec. 26, 1811. Governor and many leading citizens perished.
Moscow, Russia, 1812. The famous firing of the city by the Russians at the approach of Napoleon I; 12,000 houses burned, also palaces and churches; $150,000,000 loss.
New York, N. Y., Dec. 16, 1835. 600 buildings; loss $20,000,000.
Washington, D. C., Dec. 15, 1836. General post-office and patent office destroyed, with 10,000 valuable models, drawings, etc.
Petrograd, Russia, 1836. Lehman's Theater; 700 people burned.
New York, N. Y., Sept. 6, 1839. $10,000,000 worth of property lost.
Hamburg, Germany, 1842. $35,000,000 loss.
Canton, China, 1845. Fire in theater; 1,670 lives lost.
Pittsburgh, Pa., April 10, 1845. 1,000 buildings; loss, $6,000,000.
Quebec, Canada, 1846. 200 lives lost in theater.
Petrograd, Russia, 1847. Carlsruhe theater; 200 lives lost.
Philadelphia, Pa., July 9, 1850. 400 buildings; loss, $1,500,000; 39 persons killed.
St. Louis, Mo., May 4, 1851. Large proportion of the city burned; loss, $15,000,000.
San Francisco, Cal., May 3-5, 1851. 2,500 buildings; loss, $3,500,000.
Washington, D. C., Dec. 24, 1851. Congressional library, 35,000 volumes, with works of art burned.
London, England, 1861. Fire in Tooley Street; $10,000,000 loss.

Santiago, Spain, Dec. 8, 1863. A fire in the church of the Campania; 2,000 persons killed, mostly women.
Charleston, S. C., Feb. 17, 1865. Almost totally destroyed, with large quantities of naval and military stores.
Richmond, Va., April 2 and 3, 1865. Great part destroyed by fire at time of Confederate evacuation.
Portland, Me., July 4, 1866. Almost entirely destroyed; loss, $15,000,000.
Constantinople, Turkey, 1870. 7,000 buildings burned; loss, $25,000,000.
Shanghai, China, 1871. Fire in theater. 120 lives lost.
Chicago, Ill., Oct. 8-9, 1871. Three and one-half square miles laid waste; 17,450 buildings destroyed; 200 persons killed; 98,500 made homeless; loss over $200,000,000.
Michigan and Wisconsin, Oct. 8-14, 1871. Great forest fires; 2,000 lives lost.
Boston, Mass., Nov. 9-11, 1872. 800 buildings; loss, $73,000,000; 15 killed.
Trenton, N. J., 1872. Fire in theater; 600 lives lost.
Chicago, Ill., July 14, 1874. Another great fire; loss, $4,000,000.
Fall River, Mass., Sept. 19, 1874. Great factory fires; 60 persons killed.
St. John, N. B., June 20, 1877. Loss, $12,500,000.
Brooklyn, N. Y., Dec. 5, 1876. Theater burned, 300 lives lost.
Vienna, Austria, 1881. Ring Theater; 640 lives lost.
Berdichev, Russia, 1883. Theater fire; 268 lives lost.
Exeter, England, 1887. Theater fire; 200 lives lost.
Paris, France, 1887. Opéra Comique; 100 lives lost.
Oporto, Portugal, 1888. Fire in theater; 200 lives lost.
Seattle and Spokane, Wash., 1889. About $10,000,000 each.
Minnesota, 1894. Forest fires, $25,000,000 damage; 418 lives lost.
Hoboken, N. J., 1900. $4,627,000 loss; 215 lives lost.
Hull and Ottawa, Canada, 1900. $10,000,000 loss; 18,000 homes.
Jacksonville, Fla., May 3, 1901. Property loss $10,000,000.
Chicago, Ill., Iroquois Theater, Dec. 30, 1903. Entailed a loss of 639 lives.
Baltimore, Md., Feb. 7-8, 1904. Financial loss, $85,000,000.
Rochester, N. Y., Feb. 26, 1904. Fire in business center; loss, $2,700,000.
Toronto, Canada, April 9, 1904. Destruction in business district; loss, $12,000,000.
San Francisco, Cal., April 18-19, 1906. Fire and earthquake (see earthquakes); loss, $400,000,000.
Iloilo, P. I., April 19, 1907. 20,000 homeless.
Coney Island, N. Y., July 28, 1907. Loss, $1,500,000.
Boyerstown, Pa., January 13, 1908. 25 persons burned in a theater.
North Collinwood, Cleveland, Ohio, 1908. 167 children burned in a public school.
Chelsea, Mass., April 12, 1908. Loss, $6,000,000.
Kootenay Valley, B. C., Aug. 4, 1908. Forest fires burned three towns and $6,000,000 worth of property.
New Orleans, La., Aug. 30, 1908. Loss, $1,500,000.
Acapulco, Mexico, 1909. Flores Theater; 250 lives lost.
Albany, N. Y., 1911. State Capitol Bldg.; $1,500,000 loss.
Coney Island, N. Y., 1911. Amusement Park; $2,725,000 loss.
Porcupine District, Ont., 1911. Mining property, lumber mills, etc., $3,500,000 loss.
Houston, Tex., 1912. Business district; $4,500,000 loss.
New York, N. Y., 1912. Equitable Bldg.; $3,000,000 loss.
Salem, Mass., 1914. 1,700 buildings destroyed; $14,000,000 loss.
Jersey City, N. J., 1916. Railroad terminal warehouses and steamer; $11,000,000 loss.
New York Harbor, N. Y., 1916. Black Tom Island; $11,000,000 loss.
Ottawa, Can., 1916. Parliament Bldgs.; $3,000,000 loss.
Halifax, N. S., 1917. 1,500 killed. Explosion of war materials and fire; 20,000 homeless; 4,000 injured; $50,000,000 loss.
Kingsland, N. J., 1917. Munition factory; $12,000,000 loss.
Minnesota, 1918. Forest fires; $35,000,000 loss.
Morgan Station, N. J., 1918. Munition plant; $20,000,000 loss.
St. Louis, Mo., 1918. Government warehouse; $3,000,000 loss.
Minnesota and Wisconsin, 1918. Forest fires; 1,000 dead; $100,000,000 property loss.
Long Island, N. Y., 1919. Oil works and other plants; $4,250,000 loss.
Savannah, Ga., 1919. Fertilizer factory, cotton and railroad terminals; $4,000,000 loss.
Galveston, Tex., 1920. Morgan line piers and warehouses; $3,250,000 loss.
Old Point Comfort, Va., 1920. Chamberlain Hotel; $2,000,000 loss.
Hoboken, N. J., 1921. 4 piers, 20 lighters; $6,000,000 loss.
Tokyo, Japan, 1921. 1,000 houses in residence district; $12,500,000 loss.
Smyrna, Asia Minor, 1922. Great loss of life. City almost completely destroyed. 100,000 homeless; $12,500,000 loss.
Berkeley, Cal., 1923. 600 residences covering 35 blocks; $5,000,000 loss.
Mexicali, Mexico, 1923. 30 killed. Fire started in theater; $5,000,000 loss.
Japan, 1923, with earthquakes, houses destroyed by fire, 447,128.
Jersey City, N. J., 1924. $8,000,000 loss on waterfront.
Lake Denmark, N. J., 1926. 21 killed, 80 buildings wrecked and $85,000,000 property and ammunition destroyed by explosions and fires when lightning struck navy munition reservations.
Turkey, 1928. 60 buildings burned at Brusa; 100 buildings at Kutaia.
Hamburg, Germany, 1929. North German Lloyd line damaged by $3,000,000 fire.
Tatavia, Turkey, 1929. 400 houses destroyed, many dead.
Igolkmo, Russia, 1929. Film theater; 114 dead.
Cleveland, Ohio, 1929. Clinic; 123 dead.

FLAG, UNITED STATES

On June 14, 1777, the United States Congress passed a resolution declaring "that the flag of the thirteen United States be stripes alternate red and white; that the Union be thirteen stars, white in a blue field, representing the new constellation." In 1794, Congress decreed that after May 1, 1795, "the flag of the United States be fifteen stripes, alternate red and white, and that the Union be fifteen stars white in a blue field." This change was made to mark the admission of Vermont and Kentucky into the Union. The stars and stripes were then equal and a star and stripe were to be added with the admission of each new state. It was realized, however, that the addition of a stripe for each new state would soon render the flag too large, and a resolution was accordingly passed by Congress, April 4, 1818, reducing the number of stripes to thirteen—representing the original Union—and making the stars twenty in number. It was furthermore enacted that a new star should be added for each new state admitted into the Union. The flag now contains forty-eight stars, corresponding to the forty-eight states.

The First Flag

At the request of a committee consisting of George Washington, George Ross and Robert Morris, Betsy Ross undertook to make the first American flag. She suggested that the stars be five-pointed instead of six-pointed, and her recommendation was accepted. The American flag today still has five-pointed stars, although the number has increased from the original thirteen to forty-eight.

According to tradition the first flag, known as the "Stars and Stripes," was made by Mrs. Betsy Ross of Philadelphia, about whom succeeding years have thrown a glamour of patriotic romance.

FLAG ETIQUETTE

There is no federal law now in force concerning the manner of displaying, hanging or saluting the United States flag, but there are certain fundamental rules that are generally accepted.

The flag should be displayed only between sunrise and sunset, or between such hours as may be designated by proper authority. It should be displayed on national and state holidays and on historic and special occasions.

The flag should always be hung with the union, or stars, at the top. The only time that the flag should be displayed with the union down is as a distress signal by a vessel at sea.

Salute to the Flag

The American national emblem now carries forty-eight stars.

When carried in procession the flag of the United States should be carried on the marching right, or when there is a line of other flags, that of the United States should be borne in front of the center of that line.

International usage forbids the display of the flag of one nation above that of any other nation in times of peace. When flags of two or more nations are displayed they should be flown from separate staffs or from separate halyards of the same size and on the same level. When hung from buildings or over a street, the flag of the United States should be hung vertically with the union to the north in an east-and-west street, and to the east in a north-and-south street.

When flags of states, or cities or other special flags are flown with that of the United States, the national flag must always be raised first and be at the peak.

It is considered better form to display the flag hung flat and not festooned. For this purpose and for covering a speaker's desk or draping the front of a table or platform bunting of national colors should be used, with the blue stripe at the top, since the blue union of the flag is always above.

When flown at half-mast, the flag is hoisted to the peak for an instant, then lowered to half-mast. Before lowering for the night, the flag is again run up to the top of the staff for a moment. On Memorial Day the flag is displayed at half staff from sunrise until noon, and at full staff from noon until sunset.

When the national flag is used on a bier or casket at a military funeral, the union is placed at the head of the casket and over the left shoulder of the soldier, and the casket is carried foot first. The flag must not be allowed to touch the ground nor is it lowered into the grave.

FLOODS

Since earliest times floods have destroyed man and his possessions. Formerly endured as acts of Providence, latter day science has learned in considerable degree to prevent these disasters, although their havoc is still great. The following list gives brief information on many of the world's great water disasters, some of which came together with tornado or earthquakes.

GREAT FLOODS

Location	*Effect*	*Year*
Zealand, Denmark	1,300 drowned	1717
Yorkshire, England	Great property loss	1771
Navarre, France	2,000 persons drowned	1787
Dublin, Ireland	River Liffey overflowed, causing great property damage	1802
Lorca, Commune of Murcia, Spain	Floods caused great property damage	1802
Hungary	Overflow of Danube River destroyed 24 villages	1811
Austria, Hungary, Poland	Great loss of life and property; 4,000 persons said to have been lost	1813
Prussian Silesia	6,000 drowned; ruin of Macdonald's French army accelerated by the flood	1813
Germany	Great loss of life and property	1816
England	5,000 acres flooded in the Fen country	1819
St. Petersburg and Kronstadt, Russia	Neva River flood took 10,000 lives	1824
Danzig	Vistula River broke its dikes, many lives lost, much property destroyed	1829
Vienna, Austria	50,000 houses under water	1830
France	Over 600 houses swept away at Avignon, LaGuillotière, Vaise, Marseille, Nimes	1840
France	Floods in central and western France destroyed property valued at over 100,000,000 francs	1846
New Orleans, La.	1,600 houses flooded	1849
Sheffield, England	Bradfield reservoir burst, drowning about 250 people	1864
England	Yorkshire, Lancashire and Derbyshire, farms were destroyed, mines inundated, mills demolished	1866
Italy	Thousands of people made homeless	1872
Mill River valley, near Northampton, Mass.	Several villages destroyed, 144 people perished	1874
Eureka, Nev.	30 people drowned	1874
Pennsylvania	220 persons drowned in western part of state	1874
Toulouse, France	1,000 lives lost	1875
Szegedin, Hungary	77 persons drowned, town nearly destroyed, only 331 houses out of 6,566 remained	1879
Commune of Murcia, Spain	1,000 lives lost; 2,000 houses wrecked	1879
Iowa, Kans., Minn., Mo.	Much property damage	1881
Ohio and Mississippi valleys	138 lives lost; $15,000,000 property loss	1882
Ohio, Pa., Ky.	Heavy floods, especially destructive at Cincinnati	1883
Java and Sumatra	Tidal wave as result of earthquake, 30,000 killed	1883
Ohio River	15 drowned; 5,000 homeless	1884
Floods in New England, Pa., N. Y.	Great loss of property	1886
Texas	38 lives lost; Galveston suffered great damage from storm and flood	1886
Honan, China	Hwang River overflowed; millions perished	1887
Shantung, China	Yellow River overflowed; great loss of life	1889
Johnstown, Pa.	2,235 persons perished; Johnstown and several small towns swept away as result of dam burst above the city	1889
Consuelga, Spain	1,781 lives lost; town nearly destroyed	1891
Galveston, Tex.	6,000 lives lost; 3,000 buildings wrecked; $30,000,000 property loss	1900
Kansas City, Mo., Mississippi River towns	Many lives lost; great destruction of property	1903
Hepner, Ore.	300 drowned in cloudburst and flood	1903
Hong Kong, China	10,000 drowned	1906
Paris, France	Seine River flood; several persons drowned; $200,000,000 property damage	1910
Mississippi valley	200 drowned; 200,000 homeless; $45,000,000 property damage	1912
Dayton, Ohio	84 drowned; city partly destroyed; $128,000,000 property damage	1913
Japan	Typhoon kills 1,100	1913
Ohio, Ind.	River floods drowned 730 people; destroyed 60,000 buildings; $180,873,000 property damage	1913
China	2,000 drowned, $90,000,000 damage in provinces of Kwangtung, Kwangsi, Kiangsi	1915
States along Gulf of Mexico	300 drowned; $20,000,000 property damage	1915
Shanghai, China	500 drowned; $5,000,000 damage	1915
Cabin Creek valley, W. Va.	100 lives lost; 5,000 homeless; $5,000,000 property loss	1916
South Atlantic coast	50 drowned; $15,000,000 damage	1916
Tientsin, China	15,000 square miles flooded; millions homeless; $50,000,000 damage	1917
Porto Rico	116 lives lost; $3,500,000 property loss	1919
Pueblo, Colo.	120 dead, 140 missing; $20,000,000 property loss	1921
Mississippi valley	20,000 square miles flooded; about 100 dead; 700,000 homeless; property damage over $270,000,000	1927
New England	112 lives lost; property loss over $40,000,000	1927
California	St. Francis dam broke in hills near Los Angeles; over 250 dead; 15,000 homeless	1928
Harriman, Tenn.	20 persons drowned in river flood	1929
Tokyo, Japan	Heavy property loss	1929
Vera Cruz (state), Mexico	Many towns damaged; several hundred drowned; crop losses over $2,000,000	1930

FLOWERS, SYMBOLISM OF

Poetry, tradition and common usage have attached particular meanings to a great many flowers. The Greeks and Romans had an extensive flower language purporting to symbolize thoughts and feelings. During the Middle Ages, chivalry, as well as the Roman Church, revived floral symbolism. Such symbolism is, at best, unauthoritative and contradictory. However, it has been found interesting for sentimental reasons.

Flower	*Meaning*
Amaranth	Immortality
Anemone	Weakness
Apple blossom	Esteem
Aspen	Dread
Buttercup	Prosperity
Calla	Beauty
Camelia, white	Loveliness
Candytuft	Indifference
Cardinal flower	Superiority
Carnation, white	Disdain
China aster	Variety
Clover, four leafed	Be mine; good fortune
Clover, red	Industry
Clover, white	Think of me
Columbine	Folly
Cornflower	Tenderness
Cowslip	Charm of youth
Cyclamen	Indifference
Cypress	Sorrow
Daisy	Innocence
Daisy, colored	Beauty
Dandelion	Coquetry, flirtation
Everlasting	Eternal love
Fern	Fascination, sincerity
Forget-me-not	Sincere love
Foxglove	Deceit
Fuchsia, scarlet	Taste
Geranium, horseshoe	Stupidity
Geranium, rose	Preference
Geranium, scarlet	Consolation
Goldenrod	Encouragement
Heather	Lonesomeness
Heather, white	Good luck
Heliotrope	Devotion
Hepatica	Wrath
Hollyhock	Ambition
Honeysuckle	Friendliness
Hyacinth, purple	Sorrow
Hyacinth, white	Loveliness
Ivy	Friendship, trustfulness
Jasmine, white	Amiability
Laurel	Glory
Lilac	Discernment
Lily, white	Purity
Lily, yellow	Gayety
Lily of the valley	Unconscious sweetness
Marigold	Disdain
Myrtle	Love
Narcissus	Pride
Oak leaf	Love of country
Olive branch	Peace
Orange blossoms	Marriage
Oxalis	Sorrow
Palm leaf	Conquest
Pansy	Thoughts
Poppy, white	Forgetfulness
Passion flower	Faith
Peony	Anger
Primrose	Inconstancy
Rose	Love
Rose, damask	Beauty ever new
Rose, white	Worthiness
Rose, yellow	Jealousy
Rosebud	Confession of love
Rosemary	Fond memory
Rue	Disgust
Scotch thistle	Vengeance
Shamrock	Faithfulness
Smilax	Constancy
Snowdrop	True friendship
Sweet pea	Departure
Sweet william	Chivalry
Thistle	Sternness
Tuberose	Dangerous pleasures
Tulip, yellow	Despairing affection
Violet	Modesty
Wallflower	Patient affection
Water lily	Simplicity, purity of heart

FROST

Frost consists of crystals of frozen dew. When the water vapor in the air is so cool that it cannot condense or turn to water without going below the freezing point (32 degrees Fahrenheit), it will fall to the earth in the shape of frost crystals instead of dew. This is called "hoar frost," and sometimes "white frost." This is different from freezing, commonly called "frost," which is simply the hardening of water and moisture from the cold of winter. The frost work on the inside of window panes in warm rooms in cold weather, which sometimes takes the form of ferns or feathers of ice, is also a freezing and not a true frost. Moisture from the warm air of the room gathers on the glass, just as dew falls on grass, and is cooled and frozen there. But true frost is not frozen dew, that is, moisture which falls as dew and freezes afterward, but moisture which falls already formed in ice crystals. On cloudy nights the ground cools more slowly than when it is clear and frost is less probable. Farmers watch the sky closely in autumn. Frost kills many growing crops. This is because the freezing of the juice, which is largely water, in the plant, causes the bursting of the plant cells.

GARDENS OF THE WORLD, POPULAR

Most of the famous "gardens" were particularly fertile areas, but the Hanging Gardens of Babylon, one of the Seven Wonders of the Ancient World, were terraced to 300 feet in height in the palace grounds of King Nebuchadnezzar. (See **Seven Wonders of the Ancient World.**)

Garden of Eden. (1) First abode of man, supposed to be located near the city of Babylon. (2) A name often applied to Eden Park, Cincinnati, Ohio.

Garden of England. The Isle of Wight, and the counties of Worcestershire and Kent have all been so named.

Garden of Erin. Carlow in Leinster, Ireland.

Garden of Europe. Italy; on account of its healthful climate, picturesque scenery, astonishing fertility, and the great variety of its agricultural products.

Garden of France. The District of Indreet-Loire, noted for its rich soil and lovely landscapes.

Garden of Gethsemane. East of Jerusalem, near the Brook Kedron.

Garden of Helvetia. Name given to Thurgau, Switzerland.

Garden of Hesperides. In the western part of the mythological world.

Garden of India. Oude.

Garden of Italy. The Island of Sicily, which bears the same relation to Italy, in respect of beauty and fertility, that Italy bears to the rest of Europe.

Garden of Kentucky. Bourbon County, in that State.

Garden of Scotland. Morayshire has been so named.

Garden of Spain. Andalusia. It is fertile to the highest degree.

Garden of South Wales. The southern division of Glamorganshire.

Garden of the West. A name sometimes applied to the whole of that vast arable district west of the Mississippi, on account of its generous yield of grain, but more particularly applied to Kansas.

Garden of the World. An appellation often bestowed on that vast expanse of fertile country watered by the Mississippi and its tributaries.

Garden of Argentina. Tucuman, a province of Argentina.

Garden of the East. Ceylon and Burma. Both so called. Ceylon is also called "The Resplendent"; the "Jewel of the Eastern Sea"; the "Gem of Paradise." Its climate and productions are quite unrivaled.

Garden of the Gods. Near Colorado Springs, Colorado. Famous rock formations: Cathedral Spires, Balanced Rock, Siamese Twins, Seal and the Bear, which names the rocks resemble, were caused by the action of wind and water on the red and white sandstone.

GAS

The common gas which we burn for heat, power and light is obtained from coal. It can be easily made by breaking a piece of bituminous or soft coal into bits, filling the bowl of a tobacco pipe with them, and covering the mouth with moist clay. When the clay is well dried the bowl of the pipe should be put into the fire, where it will heat red hot. In a short time yellow smoke will issue from the stem of the pipe, which when lighted will burn with a bright flame.

This smoke is coal gas, but it is not pure. If the end of the pipe stem be put under water, the gas will rise through the water in bubbles. These bubbles of gas can be collected in a bottle or other vessel in a very simple way. Fill the bottle with water and turn it upside down in a bowl of water. The water will not run out of the bottle, because the pressure of the air on the water in the bowl will keep it in its place. If now the end of the pipe stem be put under the mouth of the bottle, the bubbles of gas will ascend into it and gradually push the water down; if there be gas enough in the pipe bowl, it will fill the bottle, taking the place of the water. Thus will have been obtained a bottle of gas, which will burn when lighted. Much of the gas used in cities and towns is made and collected in the same way, except that the coal is heated in great brick or iron ovens, and the gas is collected in immense iron gasholders.

If now the clay be removed from the pipe, some coke will be found in the bowl. A part only of the carbon went off with all the hydrogen to make the gas and the rest remained in the form of coke. When we burn coal in the open air we get from it flame and ashes, but when it is consumed in tight ovens, gas and coke are obtained. In making gas the coal is not really burned, but distilled, and the gas passes from the coal without producing any flame. Several ovens, or retorts, for distilling coal are usually built together, so that they may all be heated by one furnace, for there must be a fire outside the retort to heat the coal inside. When the retorts are filled with coal, the doors are closed tightly and the coal inside is heated red hot, when it gives off air, steam, tar, ammonia and gas. All these pass off by means of a great pipe at the back of the retorts; the tar and ammonia run off into cisterns, and the hot gas goes into coolers. When cold, it is purified by passing over lime, which takes up all the acids in it, and lastly it is put into the gas tanks, whence it is piped to the buildings where it is consumed.

GEYSERS

Intermittent hot springs that force their water flow up into the air, either at regular or irregular periods, are known as "geysers." They have a basin, usually composed of silica deposited by the water, and an opening, or tube, that leads underground. Geysers are found in various portions of the earth, the most notable specimens being those in the Yellowstone region of the Rocky Mountains and those of the southwestern division of Iceland, about thirty miles from Mount Hekla. Nearly 100 of the latter are said to break out within a circle of two miles. Few of them play longer than five or six minutes at a time, although sometimes they go on for half an hour.

The largest is the Great Geyser. It has a pipe seventy-eight feet in vertical depth, and from eight to ten feet in diameter, but gradually widening as it rises into the basin. The latter is fifty-six feet long by forty-six feet broad, and is lined with an incrustation of silica deposited from the hot water, the process being aided by the alkali soda, which, with minute quanities of various salts, exists in the water. When the geyser is about to act, subterranean noises are heard like the distant firing of cannon, and the earth is slightly shaken; then a column of the liquid element is thrown up to the height of from 90 to 100 feet. Steam after a time makes its way out of the rent, and the fountain ceases to play. Geyser action is produced by the heating of the lower part of the geyser tube, as Professor Tyndall showed.

There are geysers in the Northern Island, New Zealand, as remarkable as those of the Yellowstone Park or of Iceland. Among the most famous geysers in Yellowstone Park is Old Faithful. It erupts regularly at intervals of sixty-five minutes and continues about four and a half minutes, the water thrown to 120 to 170 feet in the air. The Giantess, when in action, is more powerful than Old Faithful, but erupts at intervals of about once a year. The Giant Geyser throws a jet 200 feet high, but erupts at irregular intervals. Castle Geyser is noted for its beautiful white basin.

GIANT'S CAUSEWAY

This remarkable group of basaltic rocks lies on the north coast of County Antrim, Ireland, eight miles east by northeast of Portrush. It consists of a vast number of columns, generally pentagonal or hexagonal. The causeway proper is a low promontory formed of closely packed columns. Altogether there are about 40,000 pillars, fitting into each other most perfectly, and jointed horizontally. Various more or less detached groups are known as the Giant's Loom, Giant's Organ, and the Lady's Fan. East of the causeway proper is the Giant's Amphitheater, a small bay with cliffs 350 feet high, formed in its upper part of two tiers of basaltic columns from sixty to eighty feet in height. Beyond this is Spanish Bay, the scene of the wreck of an armada vessel; and still farther east the noble promontory of Pleaskin Head, 400 feet high, with double tiers of lofty columns separated by a band of ochre. The peculiar columnar structure of the causeway rocks is shown by geologists to result from the contraction in cooling of the lava of which they are composed. The Giant's Causeway derives its name from the legend which ascribes its construction to Finn M'Cool, or Fingal, who bridged the channel between Ireland and Scotland in order that the giants might pass from Antrim to Staffa.

GLACIER

A glacier is a river of ice that slowly descends a mountain side. It commences primarily as a mass of snow, formed above the line of perpetual freezing, and consolidated partly by pressure and partly by the freezing of water infiltered into it from its surface. In the Swiss Alps the glaciers are between twenty and thirty miles long, their greatest breadth two or three miles, and their depth more than 600 feet.

Between Glacier Bay and Kenai Peninsula in Alaska are found some twenty-five active glaciers, the most noted being Muir Glacier, which is over a mile wide and 500 feet high at the point where it reaches the ocean. Malaspina Glacier, four miles wide at the coast and 1,200 square miles in extent, lies on the southern slope of Mount St. Elias.

Why the glacier descends has been a disputed question. Agassiz and Forbes discovered that the glacier, like an ordinary river, moved faster on the surface than below, and faster in the middle than at the sides. Tyndall attributed it chiefly to regelation, that is, to parts of it melting and freezing again. When, in descending a mountainside, the glacier has to force its way through a narrow channel, the brittle ice is crushed and broken, but by virtue of regelation it freezes anew when it has cleared the obstruction. Tyndall imitated the whole process artificially on a small scale, and his is now the accepted explanation of glacier-movement. As a glacier descends, it carries with it stones, which, on its melting, are deposited in a moraine. When these move beneath it, and project from it, the subjacent rocks are polished and scored with parallel furrows, known as striae. When the glacier moves over uneven ground, the ice may develop great cracks, called crevasses. The moving glacier scoops out lakes. If it reaches the sea, it floats off as an iceberg.

GLASSES TOUCHED BEFORE DRINKING

As athletes usually shake hands before the beginning of a contest, in the olden days persons who fought duels paused before their fighting and drank a glass of wine. To make sure that there was no poison in either glass, the habit was formed of pouring some of the wine from each glass into the other, so that if one contestant was poisoned, the other would be, too. This practice still continues, although there is no longer thought of poison, and drink is no longer actually poured from one glass to the other. Merely the act of touching the glasses is sufficient to express friendliness and good will. Thus touching glasses together in drinking, before a conference, is nicknamed "hob-nobbing" because of the material used in that action long ago. The flat part of the open hearth where water and syrup were warmed was called a "hob" and a "nob" was the small table at which people sat when thus engaged. Hobnobbing now refers to any familiar chat.

HAIL

There are two kinds of hail: the small grains, like fine shot, which often fall in winter, but rarely summer, and which generally come before snow; and larger hail, which falls usually in hot weather, and is most severe in extremely hot climates. The first is caused by the freezing of rain drops as they pass in falling through colder air than that from which they started; the second, or common hail, results from the meeting of two currents of air, one very warm and loaded with vapor, the other cold.

It is known that the air is not all of the same heat, but is divided into cold and warm parts or layers, a layer of very cold air much below freezing, often lying between two warm parts. When bodies of warm damp air move upward into one of these layers of cool dry air, the damp air is at once changed into ice, and hail falls. Sometimes the hailstones thus formed are very small, and sometimes many meet and freeze together into large masses.

HALL OF FAME

The Hall of Fame of great Americans, University Heights, New York City, is affiliated with New York University. The funds for the building were given by Mrs. Finley J. Shepard (Helen Gould) in 1900. The structure is a semicircular colonnade containing 150 panels for memorial bronze tablets and busts of famous Americans, native or foreign-born, men and women. No names are considered except of persons deceased at least twenty-five years. Fifty tablets were to be inscribed in 1900, and five at the close of each five-year period thereafter, until the year 2000 A. D., when the quota would be filled. The public was asked to suggest names, but only twenty-nine of those offered were accepted by the judges in 1900, and subsequent elections have not brought the quota to its full limit. Groups of distinguished citizens form the committees to make final selections. The substructure is devoted to a museum of letters, portraits and other memorials of those in the Hall of Fame.

PERSONAGES IN THE HALL OF FAME

NAME	BIRTHPLACE	DATES OF BIRTH AND DEATH	EDUCATION	VOCATION
John Adams	Braintree, Mass.	1735–1826	Harvard	Statesman
John Quincy Adams	Braintree, Mass.	1767–1848	Harvard	Statesman
Louis Agassiz	Motier, Switzerland	1807–1873	University of Munich	Naturalist
John James Audubon	Aux Cayes, Haiti	1785–1851	In France	Ornithologist
George Bancroft	Worcester, Mass.	1800–1891	Harvard	Historian
Henry Ward Beecher	Litchfield, Conn.	1813–1887	Amherst	Preacher, Orator
Daniel Boone	Berks Co., Pa.	1735–1820	Elementary	Explorer
Edwin Booth	Belair, Md.	1833–1893	Self-educated	Actor
Phillips Brooks	Boston, Mass.	1835–1893	Harvard	Preacher
William Cullen Bryant	Cummington, Mass.	1794–1878	Williams College	Poet
William Ellery Channing	Newport, R. I.	1780–1842	Harvard	Preacher, Essayist
Rufus Choate	Ipswich, Mass.	1799–1859	Dartmouth	Jurist
Henry Clay	Hanover Co., Va.	1777–1852	Elementary	Statesman
Samuel Langhorne Clemens (Mark Twain)	Florida, Mo.	1835–1910	Common Schools	Humorist, Writer of Fiction
James Fenimore Cooper	Burlington, N. J.	1789–1851	Yale	Novelist
Peter Cooper	New York City	1791–1883	Elementary	Philanthropist
Charlotte Saunders Cushman	Boston, Mass.	1816–1876	Private Musical	Actress
James Buchanan Eads	Lawrenceburg, Ind.	1820–1887	Self-educated	Engineer
Jonathan Edwards	East Windsor, Conn.	1703–1758	Yale	Theologian, Preacher
Ralph Waldo Emerson	Boston, Mass.	1803–1882	Harvard	Essayist, Philosopher
David Glasgow Farragut	Near Knoxville, Tenn.	1801–1870	United States Navy	Admiral
Benjamin Franklin	Boston, Mass.	1706–1790	Elementary	Statesman, Writer
Robert Fulton	Lancaster Co., Pa.	1765–1815	Elementary	Inventor
Ulysses Simpson Grant	Point Pleasant, Ohio	1822–1885	West Point	Soldier, Statesman
Asa Gray	Paris, N. Y.	1810–1888	Fairfield Academy	Botanist
Alexander Hamilton	Charles Town, Nevis, W. I.	1757–1804	Columbia	Statesman
Nathaniel Hawthorne	Salem, Mass.	1804–1864	Bowdoin College	Poet, Essayist
Joseph Henry	Albany, N. Y.	1799–1878	Albany Academy	Scientist
Patrick Henry	Hanover Co., Va.	1736–1799	Common Schools	Lawyer
Oliver Wendell Holmes	Cambridge, Mass.	1809–1894	Harvard	Poet, Essayist
Mark Hopkins	Stockbridge, Mass.	1802–1887	Williams College	Educator
Elias Howe	Spencer, Mass.	1819–1867	Elementary	Inventor
Washington Irving	New York City	1783–1859	Academic and Legal	Novelist, Diplomat
Andrew Jackson	Waxhaw Settlement, N. C.	1767–1845	Elementary	Soldier, Statesman
Thomas Jefferson	Shadwell, Va.	1743–1826	William and Mary College	Statesman
John Paul Jones	Kirkcudbrightshire, Scotland	1747–1792	Elementary and Naval	Naval Officer
James Kent	Putnam Co., N. Y.	1763–1847	Yale	Lawyer, Jurist
Robert Edward Lee	Stratford Co., Va.	1807–1870	West Point	Soldier
Abraham Lincoln	Hardin Co., Ky.	1809–1865	Self-educated	Statesman
Henry Wadsworth Longfellow	Portland, Me.	1807–1882	Bowdoin College	Poet
James Russell Lowell	Boston, Mass.	1819–1891	Harvard	Poet, Diplomat
Mary Lyon	Buckland, Mass.	1797–1849	Academic, Private	Educator
James Madison	Port Conway, Va.	1751–1836	Princeton	Statesman
Horace Mann	Franklin, Mass.	1796–1859	Brown University	Educator
John Marshall	Fauquier Co., Va.	1753–1835	Privately	Jurist
Matthew Fontaine Maury	Spottsylvania Co., Va.	1806–1873	Harpeth Academy	Naval Officer, Scientist
Maria Mitchell	Nantucket, Mass.	1818–1889	Privately	Astronomer
James Monroe	Westmoreland Co., Va.	1758–1831	William and Mary College	Statesman
Samuel Finley Breese Morse	Charlestown, Mass.	1791–1872	Yale	Inventor, Artist
William Thomas Green Morton	Charlton, Mass.	1819–1868	Harvard Medical School	Physician
John Lothrop Motley	Dorchester, Mass.	1814–1877	Harvard	Historian, Diplomat
Alice Freeman Palmer	Colesville, N. Y.	1855–1902	University of Michigan	Educator
Francis Parkman	Boston, Mass.	1823–1893	Harvard	Historian
George Peabody	Danvers, Mass.	1795–1869	Self-educated	Merchant, Philanthropist
Edgar Allan Poe	Boston, Mass.	1809–1849	West Point	Poet, Short Story Writer
Augustus Saint-Gaudens	Dublin, Ireland	1848–1907	Beaux Arts	Sculptor
William Tecumseh Sherman	Lancaster, Ohio	1820–1891	West Point	Soldier
Joseph Story	Marblehead, Mass.	1779–1845	Harvard	Jurist, Law Writer
Harriet Beecher Stowe	Litchfield, Conn.	1811–1896	Litchfield Academy	Novelist
Gilbert Charles Stuart	Narragansett, R. I.	1755–1828	London, with West	Portrait Painter
George Washington	Westmoreland Co., Va.	1732–1799	Academic	Soldier, Statesman
Daniel Webster	Salisbury, N. H.	1782–1852	Dartmouth College	Orator, Statesman
James Abbott McNeill Whistler	Lowell, Mass.	1834–1903	Privately and Imperial Art Academy, Leningrad	Painter, Etcher
Walt Whitman	Westhills, L. I., N. Y.	1819–1892	Public Schools	Poet
Eli Whitney	Westboro, Mass.	1765–1825	Yale	Inventor
John Greenleaf Whittier	Haverhill, Mass.	1807–1892	Haverhill Academy	Poet
Emma Willard	Berlin, Conn.	1787–1870	Hartford Academy	Educator
Frances Elizabeth Willard	Churchville, N. Y.	1839–1898	Northwestern Female College	Temperance Reformer
Roger Williams	Wales	1607–1684	Cambridge University, Eng.	Religious Reformer

HALL OF JOURNALISTIC FAME

The University of Illinois dedicated its Hall of Journalistic Fame on Nov. 21, 1930, when it unveiled bronze busts of twelve great newspaper editors who have left their mark on Illinois, national, or world journalism. Among them are the founders of two great press associations: E. W. Scripps, who established the United Press associations, and Melville E. Stone, founder of the Associated Press. Both men were newspaper editors as well as pioneers in establishment of news services, Scripps having founded the Scripps-McRae league of newspapers now the Scripps-Howard newspapers, and the Newspaper Enterprise association. The other men honored were Victor Lawson, of the *Chicago Daily News;* Joseph Medill, editor of the *Chicago Tribune;* Elijah P. Lovejoy, the martyr anti-slavery editor of the *Alton Observer*, who was shot to death by his opponents; William Osborn Davis, for forty years editor of the *Bloomington Pantagraph;* John W. Bailey of the *Bureau County Republican*, who laid the foundation for the largest weekly paper in the world; John W. Clinton, editor of the *Polo Press*, who led that paper to high distinction; David Wright Barkley, who made the *Wayne County Press* the model weekly of southern Illinois; Simeon Francis, editor of the *Springfield Illinois State Journal* during the life of Abraham Lincoln; Henry Clendennin, editor of the Springfield, Illinois, *State Register*, and Henry M. Pindell, diplomat and editor of the *Peoria Transcript.*

It is planned to add one name each year to the roster of famous journalists whose busts will adorn this room.

HANDS, SHAKING

Shaking hands with the right hand started in the days when everyone carried a knife or a sword. In those ancient days it was customary to indicate a friendly feeling by holding out the right hand, thus showing that there was no sword or knife concealed therein for attack.

HARP OF IRELAND

The origin of the harp in the arms of Ireland is said to have been the result of presenting the harp of Brian Boru to Henry the Eighth, who thereupon was induced to change the arms of Ireland by placing on her coins a representation of the relic of her most celebrated native king.

HIGHWAYS, FAMOUS

It is of interest to motorists to know that the highest thoroughfare in the world is Main street, Denver; the narrowest street is the Via Sol, Havana, Cuba, which has a width of forty-seven inches; the shortest is the Rue Ble, in Paris. The dirtiest is that of Tchangsti, Nankin, China; the cleanest is the Via Castile, in Seville, Spain; the most aristocratic is Grosvenor Place, in London; the most beautiful is the Avenue des Champs Elysées, Paris; and the oldest is the Appian Way, built by Julius Caesar in the days of the Romans, and still in use and good repair. Modern highways, such as the Dixie Overland Highway from Savannah, Ga., to San Diego, Cal., the Dixie Highway, from Miami, Fla., to Mackinaw City, Mich., the Yellowstone Trail from Boston, Mass., to Seattle, Wash., and Lincoln Highway that runs between New York and San Francisco, together with a number of others, can well compare with the greatest highways of the world.

HOBSON'S CHOICE

Thomas Hobson, the keeper of a livery stable, operated as a drayman between London and Cambridge in the seventeenth century. Hobson considered that he was treating his customers fairly by insisting that when they hired a horse they must take the one nearest to the door, and it was thus that the phrase "Hobson's choice" came to mean no choice at all.

HOLIDAYS AND FESTIVALS

Each nation has its own holidays, some of which, like Christmas, are celebrated throughout the Christian world, and others that receive only local recognition. Just as the United States celebrates July 4 as its Independence Day, France recognizes July 14, the anniversary of the fall of the Bastille, as its Day of Independence. The following list covers the chief holidays celebrated in the United States and Canada. (See **Legal Holidays,** p. 1066.)

Arbor Day was first celebrated in 1872, when J. Sterling Morton of Nebraska persuaded the legislature of that state to set aside a day for tree planting. Other states adopted the idea and Arbor Day is now widely observed in England, Canada and the United States. A number of states have made it a legal holiday. The date is in April or May in the North, while an earlier date is preferred in the South, Florida celebrating in January. Arbor Day is made the occasion for teaching school children the importance of tree planting and protection and has encouraged the practice of planting millions of trees each year.

Armistice Day, celebrated on November 11, a memorial to the men who fell in the World War. The armistice ending the war was signed November 11, 1918.

Ash Wednesday. In ancient times the Jews placed ashes on their heads and dressed in sackcloth. As early as the eighth century the Catholic Church established Ash Wednesday as the first of the forty-day Lenten period. For the ceremonial, palms that were blessed on Palm Sunday of the previous year are burned into ashes. On Ash Wednesday the priest blesses these ashes; the congregation assembles at church, and upon coming forward, the priest places the ashes on each person's forehead in the form of a cross, at the same time saying in Latin, "Remember, man, that thou art dust and unto dust thou shalt return."

Candlemas or Ground-Hog Day. The ancient Romans burned candles on February 2 in honor of the Goddess Februa. The Catholic Church observes Candlemas Day as the feast of the Purification of the Virgin Mary. On this day candles are blessed for use during the following year, and from this blessing of candles comes the name.

There is a popular superstition that if the ground hog comes up from the ground and sees his shadow on February 2, he will go back and six more weeks of severe winter weather will ensue before he reappears. Hence, February 2 is sometimes called Ground-Hog Day. The Canadians replace the ground hog with a bear in their version of the belief.

Christmas. The anniversary of the birth of Christ has been celebrated by a special church festival since the early centuries of Christianity. The English name is derived from two early English words, "Christes Messe," meaning Christ's Mass. In Germany this feast is called Weihnacht, and the French call it Noël, which means "birthday." In early times the date of Christmas varied in different countries, some churches observing it in December, others in January, April or May. This was due to the absence of historical data as to the exact date of Christ's birth. In the Eastern Church, January 6 was the usual date and still continues to be in the Armenian Church. In the fourth and fifth centuries, December 25 came to be the

Christmas Morning

usual date, but calendar differences still cause variations in the date of celebration.

One reason why December 25 was chosen was probably because this marks the beginning of the great winter solstice festival of the pagan Gauls, Germans and Britons. Pagan festivals were replaced by Christian ones in a number of instances, the old pagan customs and symbols being adapted to the Christian holiday, as in the case of the mistletoe, holly and yule log. During the Middle Ages, Christmas became the most popular of festivals. Churches were decorated and groups gave dramas that told of the early life of Christ. Others sang their tales, and thus the "manger songs" and carols had their origin. In Shakespeare's time Christmas was celebrated for twelve days, during which work stopped and the people spent their time merrymaking and feasting. In 1644 the Puritans caused Parliament to prohibit any festivities whatsoever. They enforced the same ruling in New England. Later the celebrations were renewed, but confined to Christmas Day.

Throughout the Christian world today, people of all faiths observe the Christmas season. This is especially true of children. The exchange of gifts, a custom that dates from medieval days, is universal. In America and England children look for Santa Claus to come in a sleigh drawn by reindeer, climb down the chimneys and fill their stockings which are hung at the fireplace. In Italy the children look to the Urn of Fate for their gifts. In Norway the presents are found hidden throughout the home. In France presents are supposed to be brought by Bonhomme Noël (Father Christmas) and put in wooden shoes placed at the fireside,

the same place the Dutch St. Nicholas puts the gifts. In some Baltic countries the Christ Child is said to bring the remembrances.

Beginning in Germany in the sixteenth century the Christmas tree, frost-covered and adorned with lights, and topped by a golden star, has played an important part at Christmas throughout the Christian world. In Spain and Italy elaborate fireworks are set off. In Scandinavian countries grain is placed on a pole for the birds. In the United States a custom has grown up of placing food outdoors for the birds. Evergreen trees growing in front of homes are frequently adorned with electric lights. A large Christmas tree, preferably a fir, is often placed in the center of a community and crowds gather and sing carols about the lighted tree at night. An important part of Christmas is the songs. The beautiful German Kristlieder and Noël song of the French, bring happiness throughout the whole world. American Christmas songs are noted for their harmony.

On Easter Day
The cross and the Easter lily figure prominently in the celebration of this day.

Columbus Day, celebrating the discovery of America, is celebrated on October 12. Schools and other public institutions are frequently closed on that day.

Dominion Day, celebrated on July 1, is a national holiday in Canada. It commemorates the formation of the Dominion in 1867. By the British North American Act the various parts of continental Canada were united under one federal government on that date.

Easter. The chief Christian festival is that which celebrates the resurrection of Christ. Easter is derived from the name of the Anglo-Saxon goddess of spring, *Eostre*, while the French name for the festival, *Pâques*, is derived from a Greek word that signifies "passing over." Easter is celebrated on the first Sunday after the full moon which follows the vernal equinox, and if that full moon falls on a Sunday, Easter occurs on the Sunday following. A number of the customs commonly observed at Easter, such as the coloring and hunting of Easter eggs, and the legend of the Easter rabbit, are of Norse origin.

Empire Day, also known as Victoria Day, is celebrated in Canada on May 24, to emphasize the unity between the various parts of the British Empire.

Fathers' Day, the third Sunday in June, was first suggested by Mrs. John Bunce Dodd, of Spokane, Wash., who launched the movement to establish this holiday as a tribute to her own father, William J. Smart, a Civil War veteran. While not an established holiday, the day is frequently observed.

Flag Day. On June 14, throughout the United States, this holiday is observed, celebrating the adoption of the Stars and Stripes as our national emblem by the Continental Congress, on June 14, 1777. The custom is to display flags and hold patriotic exercises in schools, where the story and meaning of our flag is explained. (See **Flag, United States.**)

Good Friday is the Friday before Easter and commemorates the Crucifixion of Jesus Christ. Made a legal holiday by the Roman Emperor Constantine in the fourth century, it is observed in a number of countries, and while not a legal holiday in the United States, it is largely observed. Local ruling closes schools, city departments and banks in some cities. The custom of serving hot cross buns dates back to early times.

Halloween is the night of October 31, the eve of All Saints', or All-hallows Day, which is November 1, and is probably a relic of pagan times or of medieval superstitions, as it has nothing whatever to do with the church festival. In England and Scotland it is especially selected as the time for trying spells and divinations in love affairs. The superstitious tradition regarding it is that it is the night of all others when supernatural influences prevail; when spirits of the invisible and visible world walk abroad, for on this mystic evening it was believed that the human spirit was enabled, by the aid of supernatural power, to detach itself from the body and wander through the realms of space. There is a similar superstition in Germany concerning Walpurgis Night—the night preceding the first of May. On this night the German peasants believed that there was a witch festival, or gathering of evil spirits, on the summit of the Brocken in the Harz Mountains, and that the malign influence of this convocation was to be felt all over the surrounding country. It was an old custom, and still observed in some places, to light great bonfires of straw or brush on that night to drive away the spirits of darkness supposed to be hovering in the air. Considering that All Saints' Day was originally kept on May 1, there would appear to be but little doubt that All-hallows Eve and Walpurgis Night have a common origin, which dates back to the earliest belief in a personal and all-powerful Evil One—the Chaldean's Power of Darkness.

Independence Day. A national holiday in the United States. On this, the greatest of United States holidays, is celebrated the birth of the American Republic. On July 4, 1776, Congress adopted the Declaration of Independence.

Labor Day. In 1882 the Knights of Labor celebrated improved labor conditions on the first Monday in September. Enthusiasm gradually developed concerning the plan. Colorado, in 1887, declared this day a legal holiday. Canada, and almost all states of the United States now observe this holiday. Labor Day in Europe is the first day of May.

Lincoln's Birthday, a legal holiday in many of the states, is celebrated on February 12 with patriotic exercises.

May Day was originated by the ancient Romans in honor of Flora, Goddess of Flowers. In medieval times, German, French and English youths, on the first day of May went through the countryside gathering flowers. They then selected a young girl and crowned her "Queen of the May." A maypole was then erected and covered with flowers. Merrymaking and dancing followed.

About 1890, European labor organizations selected May 1 as the occasion for celebrating improved labor conditions, much as Labor Day is observed in America.

Memorial Day or Decoration Day. Southern women first started the practice of placing early spring flowers on the graves of their dead. This beautiful custom gradually spread, until General John A. Logan, Commander in Chief of the Grand Army of the Republic, in 1868, named May 30 on which to beautify graves of soldiers.

This date has been made a legal holiday in most of the states for honoring dead American soldiers. Alabama, Georgia, Florida and Mississippi celebrate April 26, while the Carolinas observe May 10.

Mardi Gras. Mardi Gras (literally, "fat Tuesday") is the festival on Shrove Tuesday preceding the first day of Lent, or Ash Wednesday. Mardi Gras is a day of pleasure in most Roman Catholic countries. It is the carnival of the Italians, the Mardi Gras of the French, and the Pancake Tuesday of former times in England. Most of the distinctive ceremonies now annually performed in New Orleans were originally introduced by the French population as early as 1827. The day is a legal holiday, and the entire city of New Orleans is for the time ostensibly placed under the control of the great Rex, king of the carnival. There are two principal pageants. The first, in the daytime, is the escort of the beloved Rex, Lord of Misrule, through his favorite city; the other, or night pageant, is known as the Mystic Krewe of Comus. This has a character altogether unique, especially in the presentation at night of tableaux on floats in the streets and also the carnival ball. The first display was in 1857. On Twelfth Night, January 6, the Twelfth Night Revelers have a display analogous to the Mardi Gras, but more exclusively burlesque, in which they satirize the follies of the age. The public carnival season opens with Momus' appearance the Thursday before Mardi Gras.

Mothers' Day. In 1907, Miss Anna Jarvis, of Philadelphia, urged that on the second Sunday of each May a carnation be worn in honor of one's mother. The day was first observed in Philadelphia, May 10, 1908, and is now widely celebrated. In England, Mothers' Day was first observed in 1913, although there already existed an ancient rural custom of visiting one's parents on Mothering Sunday in Mid-Lent. For living mothers a carnation of any color may be worn; for a mother not living the flower should be white. Remembrances are now also presented to mothers on that day.

New Year's Day. In France, Scotland and some other European countries, China,

Japan and the Orient, this first day of the new year is considered a greater holiday and celebrated more elaborately than Christmas. It is one of the oldest and most universal holidays throughout the civilized world. The celebrations are different in different parts of the world. In Japan and China, gifts are exchanged, and there is much merrymaking. In America, New Year's Eve and New Year's Day are given over to social entertainment and visiting. At twelve o'clock midnight or New Year's Eve, explosives are set off, horns are blown, bells rung, and whistles announce the coming of the New Year. George Washington, when President, inaugurated a custom of holding a reception on this holiday and this has been observed by his successors. In Christian churches, New Year's Day is the feast of the Circumcision of Jesus Christ, and midnight mass ushers in the new year in many Catholic churches.

Saint Patrick's Day. On this day the Irish people throughout the world honor their great national saint. At the age of 106 years, St. Patrick died on March 17, 493 A.D., at Saul, County Down, and was buried at the Chieftain's Fort, about two miles from town. Bishops, priests and laymen gathered from all parts of Ireland around the burial place of their beloved leader.

Valentines
The custom of sending valentines dates back to ancient Rome and has survived to the present day.

St. Valentine's Day. The custom of sending valentines can be traced to a practice among the ancient Romans. At the feast of the Lupercalia, which was held on February 15, in honor of the god Pan, the names of all the virgin daughters of Rome were put in a box and drawn therefrom by the young men, and each youth was bound to offer a gift to the maiden who fell to his lot, and to make her his partner during the time of the feast. This custom probably became allied to the name of St. Valentine, only through a coincidence in dates. St. Valentine was bishop of Rome during the third century. He was of most amiable nature, possessed remarkable gifts of eloquence and was so successful in converting the pagan Romans to Christianity that he incurred the displeasure of the Emperor, and was martyred by his order on February 14, 270 A.D. When the saint came to be placed in the calendar, his name was given to the day of his death, and this was made a festival to offset that of the Lupercalia, and an effort was made to substitute the names of saints for those of girls in the lottery, but naturally without success. Many other customs of medieval and later times which have become allied in name to a holy saint of the church are unquestionably of purely secular, even pagan origin.

Thanksgiving Day. The President of the United States and the governors of the various states usually name the last Thursday in November as a day of Thanksgiving. The Pilgrim Fathers, after landing at Plymouth, had a very poor harvest in the summer of 1621. Although in great need, after getting the harvest in, they gathered together and thanked God for what He had given them.

Thanksgiving Day was annually recommended by Congress during the Revolution, but was discontinued from 1784 until 1789, when Congress recommended Washington to name a day of Thanksgiving for the adoption of the Constitution. In 1795 President Washington appointed a Thanksgiving Day upon the suppression of insurrection. In 1815 President Madison, upon recommendation from Congress, named a Thanksgiving Day in honor of peace. In 1863 and 1864 President Lincoln named a Thanksgiving Day and recommended that these be held annually. Since then Thanksgiving Day has been an annual event.

Twelfth Night is the eve of Old Christmas or Twelfth Day, and is the occasion of masked parties and dances.

Victoria Day. See **Empire Day.**

Washington's Birthday, February 22, is celebrated as a patriotic holiday in all states, territories and possessions of the United States.

HOT SPRINGS

A hot spring is a flow of water that has passed over hot rock or lava deep in the earth, and, as result, reaches the surface of the earth at a high temperature. Hot springs frequently carry mineral content that gives them curative qualities. Springs are known as *thermal* or *warm* when they exceed 70 degrees Fahrenheit in temperature, and as *hot* when over 98 degrees. When springs erupt intermittently and send their waters to a considerable height they are known as *geysers*, instead of *springs*. Among the famous hot springs in America a number are in National Parks. The Yellowstone contains many hot springs; the seventy-two springs on a ten acre tract near the city of Hot Springs, Ark., are famous for their curative value. They are under government control, army and navy hospitals being located there. The water has a temperature of from 72 to 157 degrees. Eureka Springs, also in Arkansas, lie in the Ozarks; Warm Sulphur Springs, Greenbrier County, W. Va., were a popular watering place at the time of the American Revolution; Hot Springs, Bath County, Va., the springs on the French Broad River, N. C., and the thermal springs near the city of Hot Springs, N. Dak., are also popular resorts.

In Europe, the hot springs in Baden-Baden and Wiesbaden in Germany are much frequented, while Carlsbad in Czechoslovakia draws patrons from all over the world. The Carlsbad Springs vary in temperature from 117 to 167 degrees Fahrenheit, and the daily flow is estimated at 2,000,000 gallons. The principal spring, the Sprudel, is of great volume and the water rises three feet from the ground. Sulphate of soda is the chief medicinal ingredient in this water. The whole town appears to be situated on a vast cauldron of boiling water, the springs forming safety valves.

HOYLE, ACCORDING TO

A colloquialism, meaning "according to the strict rules." This expression is applied today not alone, as it was at first, to cards, but to any field of endeavor. The phrase owes its origin to Edmond Hoyle, an Englishman, (1672-1769) who became the highest authority on whist through his systematizing of the rules of that game. He enjoyed this distinction until 1862 when Cavendish introduced the modernized form of play.

ICE

Water congealed so as to be rendered solid by cold is called *ice*. Ice is transparent owing to the close contact of the crystals which compose it. Water freezes at 32 degrees Fahrenheit, or zero Centigrade. Its greatest density is at about 40 degrees Fahrenheit, or about 5 degrees Centigrade; hence ice floats on water. The surface of sheets of water is frozen while their mass remains liquid. Ice one inch and a half thick will support a man.

ICEBERG

An iceberg is a hill of ice which is either floating in the ocean or has somewhere taken to the ground. An iceberg generally exists first as a glacier but when this in its onward progress reaches the cliffs and glides down them into the ocean, it ceases to be a glacier and becomes an iceberg. Captain Sir John Ross saw several together in Baffin's Bay aground in water 1,500 feet deep. One seen off the Cape of Good Hope was two miles in circumference and 150 feet high. Others were from 250 to 300 feet above the surface of the sea. For every cubic foot above there must be about eight below. Icebergs which escape from the North Polar regions in proximity to Europe usually drift to the westward and they rarely reach Britain. Many impinge upon the eastern shores of Iceland; escaping that island they are borne away in the direction of the eastern shores of America. The largest icebergs come from the west coast of Greenland, travel southward in the Polar Current to Newfoundland, enter the Gulf Stream and melt rapidly in that warm current. When an iceberg reaches a coast and melts, it generates chilling fogs, and so reduces the temperature of the adjacent land.

Icebergs carry with them earth and rocks obtained when they were in the glacier state. Icebergs often transport animals and seeds of plants to great distances. They are a menace to shipping and the chief "ship lanes" are planned to avoid the areas in which icebergs frequently travel. The wreck of the Titanic is an outstanding example of a vessel destroyed by an iceberg.

INVENTIONS

The inventive genius of man has made him supreme on the earth over all other creatures. An invention is the process of finding some new means, instrument or method of achieving an object, or a new combination of matter, or discovery in art.

The history of invention is the history of the world. When man first learned to make a fire, to raise crops from the soil, to speak, to write, to paint pictures, to build caves, houses and cities, to make laws and build institutions of learning, he created the beautiful story of the advance of civilization.

Great as were the advantages derived from inventions, mankind has not always favored them. Many inventors have been imprisoned, exiled and even put to death because of their inventive knowledge. Today the world hails the inventor, gives to him the benefit of his product, and under certain conditions issues a patent assuring him the sole use of his invention for a period of time. In the United States a patent thus protects its owner for seventeen years. Almost two million patents have been issued by the United States Patent Office alone.

Throughout each century the feeling has existed that practically all worth while inventions have already been made. But the following century sees a flood of new inventions vastly surpassing the old. The adjoining table lists inventions in chronological order.

JOHN BULL

A collective nickname for the English people. The name was first used in Arbuthnot's satire, *The History of John Bull*, as the name of a character representing the English nation. John Bull is regarded as a typical Englishman. (See also **British Lion.**)

LIBERTY BELL

The Liberty Bell was cast in London in 1752 by order of the Pennsylvania Assembly, for use in their State House. The bell reached Philadelphia the following year. It cracked without any apparent reason when rung to test the sound, and it was necessary to have it recast. This was done by Philadelphia workmen. In June, 1753, the bell was again hung in the belfry of the State House. Around it were inscribed the words: "By Order of the Assembly of the Province of Pennsylvania, for the State House, in the City of Philadelphia, 1752," and underneath, "Proclaim liberty through all the land unto all the inhabitants thereof—Levit. xxv. 10." On July 4, 1776, when the Continental Congress declared the colonies independent of Great Britain, the bell was rung for two hours, so the story goes, by the old bellman, who was so filled with enthusiasm and excitement that he could not stop. It was taken down and hidden when the British threatened Philadelphia in 1777, but was returned to the State House in 1778, when a new steeple was built for it. A few years afterward it cracked under a stroke of the hammer, and although an attempt has been made to restore its tone by sawing the crack wider, this has been unsuccessful. Since 1854 the bell has rested on a thirteen-sided pedestal in the rotunda of the State House, Philadelphia.

GREAT MODERN INVENTIONS

Invention	Date	Inventor	Nationality
Printing from movable type*	1438	L. J. Koster	German
Printing from movable cut metal type*	1450	Johannes Gutenberg	German
Knitting machine	1589	William Lee	English
Microscope, compound*	1590	Zacharias Janssen	Dutch
Thermometer	1593	Galileo	Italian
Telescope*	1608	Jan Lippershey	Dutch
Rifle, spiral grooved	1620	August Kotter Gaspard Koller	English Austrian
Adding machine	1642	Blaise Pascal	French
Barometer*	1643	Evangelista Torricelli	Italian
Multiplying machine	1671	G. W. Leibnitz	German
Steam engine, atmospheric	1705	Thomas Newcomen	English
Piano	1709	Barthommeo Cristofori	Italian
Typewriter*	1714	Henry Mill	English
Flying shuttle	1733	John Kay	English
Leyden jar	1745	E. G. von Kleist	German
Lightning rod	1752	Benjamin Franklin	American
Carding machine	1760	James Hargreaves	English
Spinning jenny	1764	James Hargreaves	English
Steam engine, separate condenser	1765	James Watt	English
Bifocal lens	1780	Benjamin Franklin	American
Pen, steel	1780	Samuel Harrison	English
Balloon	1783	J. E. & J. M. Montgolfier	French
Loom, power	1785	Edmund Cartwright	English
Threshing machine	1786	Andrew Meikle	Scotch
Steamboat, first	1787	John Fitch	American
Nail machine	1787	Jacob Perkins	American
Coal gas for lighting	1790	William Murdock	English
Cotton gin*	1793	Eli Whitney	American
Plow, cast-iron	1797	Charles Newbold	American
Lithography	1798	Alois Senefelder	Bohemian
Steam engine, high-pressure	1799	Oliver Evans	American
Electric battery, primary	1799	Alessandro Volta	Italian
Loom, pattern	1801	J. M. Jacquard	French
Locomotive, steam, on rails	1804	Richard Trevithick	English
Tack machine	1806	Thomas Blanchard	American
Steamboat, successful	1807	Robert Fulton	American
Food preservation, canning process	1810	François Appert	French
Printing press, cylinder	1811	F. König	German
Mowing machine	1812	Peter Gaillard	American
Safety lamp, miner's	1815	Sir Humphry Davy	English
Stethoscope	1816	René T. H. Laënnec	French
Diver's suit	1819	A. Siebe	German
Electromagnet	1823	William Sturgeon	English
Portland cement	1824	Joseph Aspden	English
Pin-making machine	1824	L. W. Wright	American
Matches, friction	1827	John Walker	American
Locomotive, steam, first successful	1829	George Stephenson	English
Reaper*	1834	Cyrus H. McCormick	American
Ice machine, compressor system	1834	Jacob Perkins	American
Revolver	1835	Samuel Colt	American
Telegraph, electric*	1835	Samuel F. B. Morse	American
Shotgun, practical breech-loading	1836	Casimir Lefaucheux	French
Electrotyping	1838	Moritz H. von Jacobi Thomas Spencer	German English
Screw propeller, successful	1839	John Ericsson	American
Photography	1839	Louis J. M. Daguerre	French
Vulcanized rubber	1839	Charles Goodyear	American
Photography, first human face	1840	J. W. Draper	American
Bicycle	1840	Kirkpatrick Macmillan	Scotch
Gas meter, modern dry	1843	William Richards	American
Wood pulp, for paper, mechanical process	1844	Keller and Voelter	German
Pneumatic tire	1845	R. W. Thompson	English
Guncotton	1846	Christian F. Schönbein	German
Sewing machine*	1846	Elias Howe	American
Printing press, rotary cylinder*	1846	Richard M. Hoe	American
Steel, Bessemer process	1847 1855	William Kelly Sir Henry Bessemer	American English
Stereoscope, lenticular	1849	Sir David Brewster	English
Watches, machine-made	1850	Dennison and Howard	American
Locomotive, electric	1851	Theodore N. Vail	American
Airship	1852	Henri Giffard	French
Matches, safety	1855	Lundstrom	Swedish
Gas engine, electric ignition	1857	Barsonti and Matteucci	Italian
Spectroscope	1859	Kirchoff and Bunsen	German
Monitor (warship)	1861	John Ericsson	American
Machine gun	1861	Robert J. Gatling	American
Pneumatic tool	1865	George Law	English
Dynamite	1866	Alfred Nobel	Swedish
Block signals, railway	1867	Thomas S. Hall	American
Typewriter, first practical	1868	C. L. Scholes	American
Refrigerator freight car	1868	Davis	American
Torpedo, self-propelled	1868	Whitehead	English
Air brake*	1869	George Westinghouse, Jr.	American
Oleomargarine	1869	H. Mège-Mouries	French
Celluloid	1870	J. W. and I. Hyatt	American
Welting machine	1871	Charles Goodyear	American
Car-coupler, automatic	1873	E. H. Janney	American
Telegraph, quadruplex	1874	Thomas A. Edison	American
Siphon recorder, submarine telegraph	1874	William Thompson	English
Barbed wire machine	1874	Glidden and Vaughan	American
Water gas, modern process	1875	T. S. C. Lowe	American
Automobile, gas engine*	1875	Siegfried Markus	German
Telephone*	1876	Alexander G. Bell	Scotch
Microphone	1877	Emile Berliner	American
Phonograph*	1877	Thomas A. Edison	American
Gas engine, four cycle	1877	Nicholas A. Otto	German
Arc lamp, practical electric	1878	C. F. Brush	American
Incandescent lamp	1879	Sir Joseph Swan Thomas A. Edison	English American
Cash register	1879	J. Ritty	American
Gasoline motor, automobile, patented	1879	George B. Selden	American
Cream separator, centrifugal	1879	C. G. P. deLaval	Swedish
Electric railway, first built	1880	Thomas A. Edison	American
Harvester, automatic knot-tying machine	1880	J. F. Appleby	American
Chrome tanning	1884	Schultz	American
Linotype*	1885	Ottmar Mergenthaler	American

GREAT MODERN INVENTIONS (Cont'd)

Invention	Date	Inventor	Nationality
Electric furnace reduction	1885	Cowles	American
Aluminum, Hall process	1886	Charles M. Hall	American
Smokeless powder	1886	Paul Vielle	French
Photography, roll film, modern	1887	Hamilton Goodwin	American
Monotype*	1887	Talbert Lanston	American
Motor, split-phase induction	1887	Nicola Tesla	American
Converter, rotary	1887	Bradley	American
Adding machine, recording	1888	William S. Burroughs	American
Trolley car, practical system	1888	F. J. Sprague	American
Photographic film, transparent	1888	George Eastman	American
Calcium carbide	1888	T. L. Willson	American
Rayon (artificial silk)	1888	H. deChardonnet	French
Electric welding	1889	Elihu Thompson	American
Gas mantle, incandescent burner	1890	Carl Auer von Welsbach	Austrian
Cyanide process for ores	1890	Forrest and MacArthur	Scotch
Electrolytic alkali production	1890	Hamilton Y. Castner	American
Carborundum	1891	E. G. Acheson	American
Automobile, first commercial gas engine	1891	Lavassor	French
Coherer, wireless wave detector	1892	E. Branly	French
Vacuum bottle	1892	James Dewar	English
Photography, color	1892	Frederick E. Ives	American
Motor, alternate current	1892	Nicola Tesla	American
Diesel engine	1893	Rudolph Diesel	German
Motion-picture machine	1893	Thomas A. Edison	American
Dry air process, blast furnace	1894	Gayley	American
X-ray machine	1895	William K. Roentgen	German
Wireless telegraphy, low frequency	1895	Sir William H. Preece	Welsh
Wireless telegraphy, high frequency	1895	Guglielmo Marconi	Italian
Airplane, carrying no person	1896	Samuel P. Langley	American
Torpedo, radio controlled	1897	Bradley A. Fiske	American
Steel, electric	1900	Paul T. L. Heroult	French
Diesel oil motor	1900	Rudolph Diesel	German
Caterpillar tractor	1900	Benjamin Holt	American
Submarine boat, first successful	1900	John P. Holland	American
Steel, high speed	1900	Taylor and White	American
Vacuum cleaner	1902	David T. Kenney	American
Airplane, first practical	1903	Orville and Wilbur Wright	American
Depth bomb	1903	W. T. Unge	Swedish
Grid amplifier, radio	1906	Lee DeForest	American
Gyrocompass	1906	H. Anschütz-Kämpfe	German
Bakelite	1907	L. H. Baekeland	American
Silencer for firearms	1909	Hiram P. Maxim	American
Gyrocompass, modern	1910	Elmer A. Sperry	American
Hydroplane	1911	Glenn H. Curtiss	American
Pulmotor	1911	Alexander B. Dräger	German
Tank, military	1914	Gen. E. D. Swinton	English
Motor, Liberty	1917	Vincent and Hall	American
Submarine detector	1917	Max Mason	American
Gas engine, compound	1921	C. Eickemeyer	American
Rotor ship	1924	Anton Flettner	German
Talking motion pictures, practical	1928	Bell Telephone Co. Western Electric Co. Warner Bros.	American

LIBERTY, STATUE OF

Symbolic of the spirit of liberty and opportunity in the New World, this gigantic statue of a woman clad in a Greek tunic and mantle, facing incoming vessels, and holding aloft in her right hand an enormous torch, is on Bedloe's Island, New York Harbor. The statue weighs 225 tons, and measures 301 feet 3 inches from the water level to the top of the torch.

The total cost of the work was about $600,000. The statue itself, designed by M. Frederic Bartholdi, paid for by popular subscription in France, and unveiled in 1886, was a gift from the people of France to the United States. The cost of the pedestal was met by popular subscription in the United States. The light in the top of the torch is maintained by the United States Lighthouse Service. Since 1916, the New York World has provided funds by popular subscription for the illumination of the entire statue. Stairs lead up to the head of the statue, which is open to the public during the day.

LIGHTNING

Lightning is the dazzling light emitted by a large spark darting from clouds charged with electricity. In the lower regions of the atmosphere it is white; in the upper somewhat violet, as is the spark of an electrical machine in a vacuum. Lightning does not always take the zigzag form conventionally represented. It is seen sometimes like a sharp and rugged antler standing upright, and across it a line of gleaming circles like a series of huge golden coins or a string of illuminated beads, and other forms. In the upper regions of the sky, where the air is rarefied, it tends to take the form of sheet lightning, or heat lightning; in the lower regions it becomes more concentrated and moves in lines. As a rule lightning strikes objects from above, though occasionally ascending lightning has been seen. The loftiest buildings are most in danger from its effects, and so are tall trees; the resin of pines, interfering with their efficiency as conductors, makes them more safe. When it sinks deeply into the ground, it sometimes vitrifies the rocks, producing fulgurites. Light travels with such speed that a flash is seen the instant it occurs. Thunder, which is simply the noise of the explosion, takes about five seconds to travel a mile, hence the distance of any flash, followed by thunder, may be calculated.

LINOTYPE

Otto Mergenthaler of Baltimore, an American of German birth, in 1885 invented the linotype machine. From the days of Gutenberg, in the fifteenth century, type had been cast and set by hand, letter by letter, an operator setting about fifty words a minute. There had been many improvements in printing presses during the centuries but it remained for Mergenthaler to change the method of typesetting and casting. A good operator can set approximately 175 characters a minute on the Mergenthaler machine.

The linotype machine sets up a whole line of type and casts it into one piece, or slug. The operator handles a keyboard similar to that of a typewriter, with ninety or more keys. For instance, when the letter "T" is pressed on the keyboard, the brass matrix with "T" on it is moved from its place and automatically carried to its position in the line of type. The operator touches the key for each letter desired, using the spacer between words, just as one does on a typewriter. When the matrices of the whole line of type have been assembled, the operator touches a special key and extra spacers are automatically pushed up between the matrices so that the words are spread to fill the line completely. A heating apparatus keeps the type metal molten and when a line of type is ready for casting a lever lets the hot metal flow through a long narrow slot. Poured against the matrices, this molten metal is cast into a line and cooled quickly; knives mechanically trim the slug to exact size, and the slug is conveyed by a metal arm to a box where it is dropped into place to form a column. The matrix letters are mechanically sent back to their original place for future use in making lines of type.

The modern linotype machine can carry eight alphabet sets, and these, with punctuation marks, provide a total of 720 characters that are operated from one keyboard. A whole line must be reset in order to correct an error but this can be done much more quickly than by the old hand-setting method, and the type is not mixed or pied if a line is dropped. The linotype machine has revolutionized the making of newspapers and magazines by the increased rapidity of typesetting.

LITTLE CHURCH AROUND THE CORNER

This is the popular name for the Church of the Transfiguration, located at 1 East 29th Street, in the heart of the business section of New York City. In 1870, the famous actor, Joseph Jefferson, in his effort to arrange for the funeral of a brother actor, George Holland, was advised to go to "a little church around the corner" where the funeral of an actor could be held. Ever since, members of the stage profession have had a marked affection for this church, and there today is located the headquarters of the Episcopal Actors' Guild.

LONGEVITY, HUMAN

The following list of instances of remarkable longevity is given on the authority of Prichard, Whitehurst, Bailey, and Easton.

Name	*Date of Death*	*Age*
Apollonius of Tyana	99 A. D.	130
Attila	500 A. D.	124
Llywarch Hen	500 A. D.	150
St. Coemenge	618 A. D.	120
St. Mongah or Kentigern	781 A. D.	185
Piastus, King of Poland	861 A. D.	120
Countess of Desmond	1612 A. D.	145

Name	Date of Death	Age
Thomas Parr	1635 A. D.	152
Thomas Damme	1648 A. D.	154
Dr. Mead, Hertfordshire	1652 A. D.	148
James Bowles, Kenilworth	1656 A. D.	152
Henry Jenkins	1670 A. D.	169
William Edwards	1688 A. D.	168
Petrarch Czartan	1724 A. D.	185
Margaret Patten	1739 A. D.	137
John Roven	1741 A. D.	172
Mrs. John Roven	1741 A. D.	164
John Effingham, Cornwall		144
Thomas Winslow, a captain under Cromwell	1766 A. D.	146
Draakenburg, a Dane	1772 A. D.	146
Jonas Warren, Ballydole	1787 A. D.	167
Jonas Surington, Bergen, Norway	1797 A. D.	159
Demetrius Grabowsky, Poland	1830 A. D.	169
Bridget Devine	1845 A. D.	147
Bruno Cotrim, Buenos Aires	1897 A. D.	150
Robert Tyler, England	1898 A. D.	134

LYNCH LAW

Lynch law is summary punishment, especially death, without form of law. It is frequently mob law, or, as in the case of the vigilance committees of the old West, the mode of ridding an outraged community of its incorrigible offenders.

There are various accounts of the origin of the term. One, which is perhaps as probable as any, is to the effect that the phrase, "lynch law," was derived from a native of Campbell Co., Va., old Colonel Lynch, who, during the American Revolution, was in the habit of administering summary punishment to miscreant Tories of every description, without paying any attention to the ordinary process of law. Hence he was called "Judge Lynch," and this, it is said, is the true origin of the terms "lynching" and "lynch law."

The Carolina Regulators, 1770, administered whippings to offenders on Lynch's creek, and this is another possible explanation of the term.

MAELSTROM

The Maelstrom, which means, literally, "grinding stream," is situated on the Norwegian coast, southwest of the Loffoden Isles, and is the most remarkable whirlpool in the world. It runs between the Island of Moskenes and a large solitary rock in the middle of the straits. The strong currents, rushing between the Great West Fiord and the outer ocean, through the channels of the Loffoden Isles, produce a number of whirlpools, of which the Maelstrom is by far the most dangerous. During severe storms from the west, for instance, the current runs continually to the east at the rate of six knots an hour, without changing its direction for rising or falling tide, and the stream boils and eddies in such mighty whirls that the largest steamer could hardly contend successfully with the waters. The depth of the whirlpool is only twenty fathoms, but just outside the straits soundings indicate a depth of from 100 to 200 fathoms.

MAN IN THE MOON

One of the most ancient as well as one of the most popular superstitions concerns the man in the moon, a shadowy figure suggested by the dark lines and spots upon the surface of the moon. The legend is supposed to have originated in the account given in the Book of Numbers, xv, 32-36, of a man stoned to death for gathering sticks on the Sabbath. In one of the drawings representing this character, he appears as a man with a staff over his shoulder, on which he carries his fatal bundle of sticks. He is followed by a dog.

MASON AND DIXON'S LINE

The boundary line that was established between the colonies of Maryland and Virginia and the colony of Pennsylvania has long been known by the names of the men who ran it. With the exception of about twenty-two miles, the line was laid by the English surveyors, Charles Mason and Jeremiah Dixon, who did the work between November 15, 1763 and December 26, 1767. During the excited debate in Congress, in 1820, on the question of excluding slavery from Missouri, the eccentric John Randolph of Roanoke made great use of this phrase, which was caught up and re-echoed by every newspaper in the land until it gradually came to mean the line of division between the free and the slave-holding states.

MAYFLOWER COMPACT

The following is a list of the male passengers who signed the Mayflower Compact, agreeing as to the government of the colony. The ship landed at Plymouth on December 21, 1620. The following forty-one signers represented the entire company which numbered 101.

MICROSCOPE

A microscope is an optical instrument for magnifying minute objects so as to render them visible for purposes of investigation. A simple microscope, whether of single or of several lenses, gives a view of the object directly. A compound microscope furnishes a reversed and magnified view of the object. The objective lens at one end of the metal tube is placed near the object. The ocular or eye piece lens also magnifies the object.

A Hollander, Zacharias Jansson, is believed to have invented the first compound microscope in 1590. Benjamin Martin first made pocket microscope in London in 1740. However, the discovery of the magnifying power of the lens was made long before the Christian era. Reading glasses and rude magnifying glasses have been found in ancient Egyptian ruins. Some historians give the credit of inventing the microscope to Galileo, the famous astronomer.

The strength of a microscope depends upon the strength of the object glass, the ocular glass and the distance that these are placed apart. The greater the distance the more powerful the microscope. For the human eye, enlargement has customarily been made 2,000 times the size of the object. For photographic purposes, enlargement has been 5,000 times the actual size. The only limit to the power of the microscope seems to be that no object smaller than one-half the wave length of the light by which it is seen can be shown in its true form. The microscope has been tremendously valuable in aiding physicians to ascertain diseases and trace various forms of bacteria to their source. Surgeons accurately examine new growths on the body by means of the microscope. Bacteriologists, biologists and botanists, use the microscope in their studies, thus greatly enlarging man's control of nature. The microscope betrays impurities in drugs, food, paint and in the physical structure of copper, iron and steel.

MILITARY ACADEMY OF THE UNITED STATES

Congress founded the military academy at West Point in 1802. This government reservation, including Constitution Island, consists of about 3,575 acres. The buildings and beautiful grounds are valued at $25,000,000. During the Revolution, Kosciusko directed the fortifications built here. Benedict Arnold planned to betray this fort to the British, but discovery of his plot was made when Major Andre was captured. The ruins of the old revolutionary Fort Putnam may still be seen.

The academy, considered one of the finest military schools of the world, is an institution established by the United States Government for the practical and theoretical training of young men for the military service. Its cadets are given a comprehensive and general education of collegiate grade and a sufficient basic military training to enable them to enter upon the duties of a second lieutenant in any branch of the army to which they may be assigned. The maximum number of cadets is 1,378. Four are selected from each state at large, two from each congressional district, two from each territory, four from the District of Columbia, two natives from Porto Rico, four from the Philippine Islands, 122 from the United States at large, of whom two are appointed upon the recommendation of the Vice President and twenty are selected from among the honor graduates of those educational institutions which have officers of the Regular Army detailed as professors of military science and tactics and which, upon the determination of their relative standing at the last annual inspection regularly made by the War Department, were designated as "honor military schools." Of these, forty are chosen from among the sons of veterans who were killed in action or died prior to July 2, 1921. One hundred eighty are chosen from among the men of the Regular Army and of the National Guard in number as nearly equal as practicable. This enumeration represents the maximum allowed at the military academy at any one time, hence no appointments can be made from any source except to fill a vacancy.

There are three methods of meeting the educational requirements for admission: (1) by successfully passing the regular entrance examination, (2) by submitting a satisfactory educational certificate to be validated by special examination or (3) by submitting an educational certificate which does not need

a validating examination. These examinations are held on the first Tuesday in March each year, and again on June 25 at West Point to fill vacancies which occur after the March examination. Candidates from the Philippine Islands appear for mental and physical examination on the second Tuesday in January before a board of army officers who convene at such a place in the Philippines as the commanding general of the Philippine Department may designate.

MIRAGE

A mirage, or looming, is an optical illusion sometimes seen at sea, on large lakes, on the icy wastes of the polar regions, and on deserts and arid plains. In mirages, images of various distant objects appear, usually top side down, while the objects themselves may or may not be within sight. Sometimes mirages appear as enlarged images of distant and invisible objects, thrown in relief against the sky. Mirages are caused by the refraction and reflection caused when light, in reaching a person from a distant object, passes through layers of air that are unequally heated, and which are therefore of different densities. When the reflecting layer of air is level and lower than the eye of the observer, the mirage often appears as a sheet of wind-ruffled water, a form of mirage common in the desert. When the reflecting layer of air is higher than the eye, the image appears to be located in the sky. A looming is a form of mirage in which objects appear greatly magnified both vertically and horizontally. The "Specter of the Brocken," seen in the Harz Mountains of Germany, is a well-known example of this type of mirage. The exploring parties with Commander Byrd's Antarctic expedition in 1929 sometimes saw a looming of the district they were to traverse the following day, great crevassed areas to be faced on the morrow.

MISSING LINK

The gap between the monkey and man is called the "missing link." According to Darwin, the present host of animal life began from a few elemental forms, which developed, and by natural selection propagated certain types of animals, while others less suited to the battle of life died out. Thus, beginning with the larvae of ascidians (a marine mollusk), we get by development to fish lowly organized (as the lancelet), thence to ganoids and other fish, then to amphibians. From amphibians we get to birds and reptiles, and thence to mammals, among which comes the monkey, between which and man is a "missing link."

MOLLY MAGUIRES

The first organization of Molly Maguires was formed in Ireland, in 1843, with the object, it is believed, of generally misusing process-servers and others engaged in the prosecution and eviction of tenants, and was composed of young men who, in some localities, assumed women's clothing, blackened their faces, and otherwise disguised themselves. It remained, however, for the American "Mollies" to terrorize whole counties, intimidate mine owners and officers of the law, and leave a blood-red trail behind them in the coal regions of Pennsylvania in 1854. There is no recorded instance where the disguise of women's clothes was assumed in the United States. Through the effort of James McParlan, a detective, the secrets of the order were finally revealed, rioting was stopped, and an end was put to the organization and many of its members were brought to justice in 1877.

MONOTYPE

The monotype equipment consists of two machines: a composing machine and a type-caster. The operator sits at a keyboard similar to that of a typewriter, but having 260 keys. By depressing a key he makes holes in a moving strip of paper, each combination of holes designed to control the casting of a letter corresponding to that which the operator depressed. When a line is nearly set, an automatic indicator tells the operator the exact amount of space needed to fill the line. The perforated paper is called the "controller paper" because, when inserted in the casting machine each type is separately cast in the order indicated on the paper, each set of perforations bringing into motion its corresponding matrix from which the type is cast. Next, the machine forces into the mold molten metal from a container that is heated by gas or electricity. The width of the type mold alters automatically to fit the width of each letter as it is cast, becoming narrow for an "I" and expanding to its widest for "M." Thus the type is cast, and the machine then automatically gathers the letters in order until a line is formed. Special spacers fall in to fill or justify the line to the required length, and the lines are carried in order to the case. Five alphabets can be cast from one machine, and different faces of type and various type sizes be reproduced. The machine was invented in 1887 by Talbert Lanston, long a clerk in the pension office at Washington. While the linotype machine is usually preferred for newspaper work, the more careful typesetting required for book, magazine and fine job printing work generally employs the monotype machine. *The Volume Library* is set by monotype.

MONTHS OF THE YEAR

The word "month" is derived from *mona*, the Anglo-Saxon word for "moon," the month lasting from one new moon to the next. A lunar month—*luna* is the Latin word for "moon"—was twenty-eight days, twelve hours, and a fraction over forty-four minutes long. The solar month, which we use, is practically one-twelfth the length of time it takes the earth to revolve around the sun. Calendar months are of different lengths but they total almost one full revolution around the sun in a year, the slight extra time each year being set straight by the extra day in every fourth, or leap year.

The months bear names that remind us of the old Romans, for January was so called in honor of the two-faced god, Janus, who guarded Rome; February was thus named because on the fifteenth of that month was held the *februa*, a Roman festival of expiation and purification; March for Mars, the great god of war. March was the first month of the year in the old Roman calendar. Then came April, Aprilis in Latin, said to derive from *aperire*, to open or blossom; May, named in honor of Maia, the goddess of growth and the mother of mercury; June, Junius, in honor of a powerful Roman family. July honored Julius Caesar. Augustus Caesar named the following month August to honor himself. The seventh month of the old calendar was September, *septem*, meaning seven; October, from *octo*, or eight; November from *novem*, or nine; and December *decem*, meaning ten, the old tenth month.

Monuments. See **Buildings and Monuments.**

MOONSHINERS

The term arose in the mountains of North Carolina and Tennessee, where the practice of making illicitly distilled whiskey was carried on chiefly at night in order to avoid payment of the government excise tax. Since the passage of the Volstead Act, the word *moonshine* has been applied to any illicitly-brewed whiskey.

MORGANATIC MARRIAGE

A morganatic or left-handed marriage is one between a man of superior and a woman of inferior station, in which it is stipulated that the woman and her children shall neither enjoy the rank nor inherit the possessions of her husband. Such marriages are not uncommon in the families of sovereign princes and of the higher nobility, in certain European countries; but they are restricted to personages of these classes.

MOTION PICTURES

After the invention of photography, many attempts were made to depict various objects while they were in motion. The most successful of these early efforts were those of Edward Muybridge who placed twenty-four cameras in a row, attached strings in such fashion that a horse trotting by them broke the strings in succession and made exposures that showed his successive motions. The photographs thus obtained were pasted in a strip and moved rapidly to give the effect of continuous motion. But this was in 1872, and Muybridge had to work with glass plates. It was not until Goodwin invented the convenient bendable form of continuous film in 1887, and Eastman perfected and produced it the following year, that modern methods of photography became possible. After considerable experimentation, Edison produced the kinetoscope in 1893, a machine that used photographs on an endless strip of celluloid. It was a successful motion picture machine, but with the drawback that only one person could use it at a time. Then came Thomas Armat, who devised a means of projecting pictures on a screen so that many could see them at once. C. F. Jenkins worked out the device whereby the film moves intermittently, and the modern motion picture was born.

The theory on which motion pictures work is based on a peculiarity of the human eye which allows it to seem to see an object for a fraction of a second after it is gone. Thus the eye holds an image long enough for the next picture to be presented and gets an effect of continuous action. The motion picture machine changes the pictures so rapidly that

the screen is in darkness for less than one-fiftieth of a second and the effect of continuous vision is produced. In modern motion pictures each image is at rest for about one-twentieth of a second, and about sixteen pictures are shown in a second. The various motion picture companies make film and pictures of uniform size. A reel is 1,000 feet long, a strip is 200 feet long and one and three-eighths inches wide. Each picture is an inch by three-quarters of an inch in size, the film being enough wider to leave a narrow margin on each side with sixty-four perforations to the foot. The perforations enable the machine to hold the film securely while the shutter of the moving picture camera is open. When the shutter closes, the whole film is pulled forward exactly three-fourths of an inch. A fine lens is used, and the shutter is a perforated, revolving disk.

After exposure the film is developed and a great many positive films made from the negative. These are pasted in proper sequence and sent out to exhibitors. When a picture is projected on a screen, an electric arc usually produces the light in the projecting machine. This light passes through the positive film and through the projecting lenses to the screen. There the picture appears in greatly enlarged form. Nearly all film is made of highly inflammable and explosive celluloid, so the projecting machine is provided with an automatic shutter that protects the film from the light if the machine accidentally stops. When not in use, film is stored in asbestos-lined boxes. A special fireproof room is provided for the projecting machine and its operator in practically all modern motion picture houses.

Many unusual effects can be obtained by trick photography. One actor may play two parts, apparently fall off of high cliffs, scale the straight side of a high building, or appear in transparent ghostliness. Colored motion pictures are produced by projecting pictures through color screens. Cartoons and action drawings are created by reproducing the picture of a large number of individual drawings. But not the whole picture needs to be drawn each time. If a cartoon shows a man who is moving only his arms, a photograph of the quiet part of the body is made in quantity, and the artist pastes these up and draws on to each one the successive pictures of the moving arms. In this way the required amount of drawing is greatly diminished.

Motion pictures may be instructive as well as entertaining. Activities in every part of the globe are portrayed, making graphic tales of geography, history, chemistry, zoölogy and biology. Games of skill and the methods employed by expert athletes are brought before people by means of the slow-motion picture which provides opportunity to see action slowed down so that it is possible to learn how a thing was done. Industrial firms give technical instruction by means of slow-motion pictures; surgeons study the efficient methods of operating carried on in distant hospitals. Mechanically-timed exposures permit photographing opening flower buds, birds emerging from the shell, and similar phases of nature that would take hours to watch in actual life, but that can be shown on a motion picture screen in a few minutes.

The motion picture industry that began in a little paper-covered shanty, with Edison and a single assistant as the entire staff, has grown until it employs several hundred thousand people and pays wages and salaries of over $130,000,000 each year. The industry is divided into three divisions: production, distribution and exhibition. The films produced in the United States supply about ninety per cent of the world's market, Germany being second in production and distribution. Great production "lots" are found in various parts of the United States, the chief ones being in California and in the environs of New York City. The greatest of actors appear in films. Sarah Bernhardt paved the way, being lured by the thought that only in that manner could her art be preserved for the future. But the art of the motion picture is different from that of the regular stage. To eliminate waste movement,

Amateur Motion Picture Camera
This camera is simple in operation and is widely used. The sighting devices are shown in position.

the director has the scenario writer list all the different scenes separately so that all the action supposed to take place in certain surroundings, or with a given group of actors may be photographed together and save using a set over a long period of time. The characters may meet in a living room in the first scene and not meet there again until near the end of the play, yet all scenes in that room must be acted in succession. Some unusual character may appear in only a couple of scenes, a person who can spare but a short time, and the scenes in which he appears are photographed without relation to the story as a whole. The camera records only that which is directly in the angle of view, and actors must learn to bear that in mind.

Many people do not photograph well and therefore find the motion picture field closed to them. Others require unusual make-up in order to "register" well on the screen. The advent of the talking motion picture brought about a new code of requirements for motion picture actors. The improvements in color photography brought another problem to the motion picture producer. There is constant change and growth in the industry as invention solves old problems and, in so doing, creates new ones for the industry that has brought entertainment within the reach of the most remote town and to the person whose limited time or spending capacity has kept him out of the regular theater.

Motion Pictures in the Home. The motion picture was commonly believed to have reached its highest peak about 1920, yet two developments since then have carried the pictures to a national niche never before reached. These developments are the talking motion pictures and the apparatus for producing motion pictures at home.

More people are watching motion pictures today than ever before, and in addition, a host of average citizens are acting before their own cameras.

The number of American families that are playing roles in their own motion pictures is well above 100,000, according to estimates. They use cameras built to hold amateur standard safety film, which is non-inflammable and which is sixteen millimeters wide as against thirty-five millimeters for professional film. Most of the cameras are simple in operation and capable of taking pictures indoors or on dark days. They are held in the hands and sighted at either eye level or waist level, and driven by a spring motor released with a trigger. The only preparation for "shooting" is setting the diaphragm in accordance with the amount of light needed for the picture, deciding on the distance from the object to the camera, in the case of the newer models, and then winding the motor.

The advent of color photography was a great boon to motion picture makers. It is one of the outstanding photographic achievements of all time. At the mere pressure of a finger beautiful natural-color pictures can be made, simply by slipping a color filter into the lens barrel of the camera that takes black and white pictures, and using a different film.

Motion picture makers are finding panchromatic film next best to color. This film, although producing black and white pictures, renders them in their correct tonal values. For instance, red photographed with ordinary film shows up black on the screen. When panchromatic film is used, red photographed next to some darker color, say dark blue or brown, shows up lighter, thereby establishing its difference in tonal value.

Families which are making the best use of their cameras take pictures systematically of family episodes and eras, preserving a unique family record. Families widely separated frequently send motion pictures of themselves to each other.

But amateur motion picture cameras are used in other ways. Doctors use them to photograph operations so that classes of medical students may be taught more systematically and doctors away from medical centers may keep in touch with the advance of surgery. Industrial establishments use cameras and projectors to film their products and send motion picture reproductions of them in place of catalogs or salesmen's display cases. The small cameras are employed in dozens of other scientific and industrial uses. Pictures have been used as evidence in court, and amateur dramatic organizations write, produce, act and photograph their own scenarios.

Amateur motion picture projectors are on a simple scale commensurate with the cameras. The most up-to-date models have arrangements for stopping the action, projecting one "frame" at a time, like a still picture, and for reversing the action, "the

diver leaping backward out of the water and onto a springboard" sort of thing which amuses an audience.

The ultra-modern library projector has the mechanism contained in a case and has a small translucent screen attached that makes it suitable for an audience of only two or three. A cabinet, made as a base for the projector, has storage space for humidors of film, an emergency splicing outfit, a larger screen for projection before groups which can be used for either black and white or color pictures and a shelf to lay the empty humidors on while projecting.

The introduction of home motion pictures entailed economies in the film. First, amateur film is slightly less than half as wide as professional film, and a 100-foot reel of amateur film contains as long a motion picture as a 250-foot reel of professional film. The meaning of these comparative dimensions is that the same length of motion picture film requires more than five times the area of film with a professional motion picture camera as with an amateur camera. An equal amount is saved by the ingenious "reversal process," which eliminates the necessity of printing motion picture negatives on separate film and instead turns the negative itself into a positive. It is principally this very great saving in film which has made motion picture photography sufficiently inexpensive for private families to enjoy and yet retain the photographic quality of amateur film.

Talking Motion Pictures. The attempt to synchronize, or cause time agreement of sound with motion pictures is almost as old as the motion picture itself. Gaumont in France, and Edison in the United States. succeeded in producing talking motion picture machines in the last decade of the nineteenth and in the early years of this century.

A small group of engineers in the employ of the Bell Telephone laboratories, in 1914, began a series of experiments which led to the development of an apparatus to record and reproduce sound electrically. The first application of the new electrical method of recording was made by the Victor and Columbia phonograph companies in 1924, causing a great revival of the phonograph business which had been seriously affected by the radio. The experiment worked out so effectively that a plan of synchronously recording and reproducing sound and motion picture was soon begun. Within a short time a special type of motor was developed which made it possible to operate a number of cameras and recording machines in exact synchronism with each other.

The cycle of operations in recording is by way of the microphone through the amplifier to the recording machine. In reproducing, the cycle is reversed. From the disk the recorded vibrations are transmitted by means of a needle to an electromagnet; the resulting current is amplified and transmitted to a loud-speaker, which is nothing more than an elaborate telephone receiver. This is located at the back of the stage immediately behind the picture screen.

Another method of recording makes use of photography, the record being made at one edge of the motion picture film. A variable current, representing the sound waves, causes two tightly stretched wires placed close together in a magnetic field to vibrate in exact conformity to the vibrations of the sound waves. A bright light is focused through the aperture between these vibrating wires to a moving piece of film, resulting in an impression consisting of a series of small parallel lines of varying density and distance apart. A slight deviation from this method is to vary the intensity of the light source by connecting the wires leading from the microphone to the terminals of the lamp and projecting through a fixed aperture. The former process is called the "light value" method, the latter the "flashing lamp" method.

To reproduce a film record, it is passed through a bright beam of light focused through an opening to a photo-electric cell, which is a kind of vacuum tube, having the property of generating an electric current when light strikes it. The current goes to the same amplifier as the current from the needle of the disk reproducer and thence to the loud-speaker. The entire projector mechanism is driven by a single motor through mechanical gearing so that with a record or film started correctly, sound and picture go on simultaneously. It is, however, possible that lip movement and sound do not fit together properly, the words being heard too soon or too late, making a most ludicrous effect.

In the room where sound pictures are taken the walls and roof are covered with sound-proof material to deaden the echo. The movietone, a product of Fox laboratories, permits the taking of talking-pictures in the open. In every sound studio there is a monitor room from which a man "listens in" and controls the volume of sound current received by each of the microphones in use in the studio below.

With the advent of sound on the screen there came also a revolutionary effect on many phases of production. Electrical and acoustical engineers at once came into prominence. The erection of sound-proof stages also helped to bring about the development of the voice for screen purposes so that the "talking" picture has popularly replaced the silent picture, a solely pantomimic art.

The advantages of the sound picture are many, particularly in the educational field. A committee from the National Education Association reported its views on a program of subjects that might well be taught by the film in the schoolhouse. The sound picture also opens the field of opera to people who have no other opportunity both to see and hear the great actor-singers of their day. Forward-looking religious bodies are experimenting with the religious pictures as a means of stimulating greater interest in church and young people's classes. With the passing years it seems possible that the talking picture may be instrumental in bringing about a better understanding between nations and furthering the movement toward universal peace by affording the opportunity of presenting to the masses of each generation an almost living replica of the leaders and great men of their nations.

MOURNING

Although black is the conventional garb of mourning in the United States and most of the Western nations, various colors are used in other lands. Aside from America, the following listing gives the garb for a number of countries and peoples.

Black. The color of mourning in Europe; also in ancient Greece and Rome.
Black and white striped. Expressive of sorrow and hope combined; worn by the South Sea Islanders.
Grayish brown. The color of the earth; worn in Ethiopia.
Pale brown. The color of withered leaves; worn in Persia.
Sky blue. Expressive of hope for the deceased; worn in Syria, Cappadocia and Armenia.
Deep blue. The mourning of Bokhara, in central Asia; worn also by the Romans under the Republic.
Purple and violet. Denotes royalty: worn for cardinals and the kings of France.
Violet. Used in Turkey.
White. Mourning of China. Until 1498 it was the mourning of Spain.
Yellow. Mourning worn in Egypt and Burma. Yellow may be regarded as a token of exaltation.

NATIONAL ANTHEMS

Nearly every civilized country has its officially recognized national anthem. Sometimes there are other songs, like *America* in the United States, which are as popular as the official anthems. Sometimes there is a song that is the popular song in one section of a country, like *Dixie* in the Southern States. Again, a change of government may bring a change in the official anthem, as has happened in a number of European countries since the World War. While there is some question as to the official anthem in a few instances, notably in modern Russia, the following list is representative.

Argentina. *Oid, mortales, el grito sagrado* (Mortals, Hear the Heavenly Call). The music is by D. V. Lopez.
Australia. *Song of Australia.* Words by Mrs. Carleton and music by Singer.
Belgium. *La Brabançonne.* The words of this song of "the people of Brabant" were written during the revolution of 1830, when Belgium obtained her freedom. The music was composed by François van Campenhout, a member of the theater orchestra in Brussels, and the words were by Louis Dechez Jenneval, who was killed in action near Antwerp.
Bohemia. *My Fatherland* and *War Song of the Hussites*, have for centuries been the two well known national anthems of Bohemia.
Brazil. *Hymno da Proclamacão da Republica* (Hymn of the Proclamation of the Republic). Music by Leopoldo Miguez and words by Medeiros e Albuquerque.
Burma. *Kayah Than* (Blow the Trumpet).
Canada. *The Maple Leaf Forever.* Words and music by A. Muir.
Chile. *Dulce Patria.* Words and music by Carnicer.
Costa Rica. *De la Patria.* Written by M. M. Gutierrez.
Czechoslovakia. *Kde Domov Muj?* (Where is My Fatherland?)
Denmark. *King Kristian stod ved höien Mast.* (Beside the Mast Stood King Christian). Music by Hartmann, words by Ewald.
Ecuador. *Salve, O Patria* (We Greet Thee, Our Fatherland).
Egypt. *Salaam Effendi* (The Khedive March).
Finland. *Vårt Land* (Our Fatherland). Music by F. Pacius, words by J. L. Runeberg.
France. *La Marseillaise* was the inspiration of Rouget de l'Isle, who wrote both words and music in one night in 1792. It was sung at a civic dinner at Marseille and met with such instant success that copies were printed and distributed to the volunteers who sang it as they entered Paris on their way to the storming of the Tuileries. The delighted Parisians named the song in honor of the city of Marseille and soon its strains were heard in every corner of France. There was some dispute as to authorship but Rouget de l'Isle's claims were fully established in 1865.
Germany. *Heil Dir im Siegerkranz* (Hail Thee, Whose Victor's Crown), was the anthem of the German Empire, written in 1790 by Heinrich Harries, and sung to the tune of *God Save the King.* Two old favorite patriotic songs have taken its place, *Die Wacht am Rhein* (The Watch on the Rhine) by C. Wilhelm and M. Schneckenburger, and *Deutschland über Alles* (Germany Above All) with words by H. von Fallersleben set to the music of J. Haydn.
Great Britain. *God Save the King.* The authorship of this song has been greatly disputed, but probably the honor belongs to Henry Carey, who sang the words set to his own music at a dinner given in 1740 to celebrate the capture of Portobello by Admiral Vernon on November 20, 1739. The earliest known printed copy was published in the *Harmonia Anglicania* about 1742. The tune, while almost the same, differed

from the latter in several bars. In 1745, during the Scottish rebellion, it was sung in theaters as "a long song or anthem." Its first public presentation occurred at Drury Lane on September 28, 1745. Other countries have adopted the melody for their own use, notably the United States, in *America*.

Greece. *Sons of Greece, Come, Rise.* During the Greek war for independence in 1821-1829, the words and music were written.

Hungary. *Isten áld meg a Magyart* (Lord Bless the Hungarian). Music by F. Erkel.

Italy. *Marcia Reale Italiana* (Royal Italian March), by G. Gabetti. Equally popular is *The Garibaldi Hymn* by Luigi Mercantini. Probably because of lack of political unity Italy for many centuries had no national hymn, the people contenting themselves with the rather trivial composition written about 1834 by Gabetti. The people created a hymn for themselves during the stormy period around 1858. To the verses of Luigi Mercantini the military bandmaster, Allessio Olivieri set a genuine Italian melody which, under the name of *The Garibaldi Hymn* has become the popular song of the nation.

Japan. *Kimi Ga Yo Wa* (May Our Sovereign Lord Remain). At the beginning of the tenth century the Emperor Daigo commanded a collection of poems to be compiled under the title of the *Kokinshu* and the words of "Kimi Ga Yo Wa" were included, but the author is unknown.

Latvia. *Dievs sveti Latviju* (God Bless Latvia).

Mexico. *Mexicanos, al grito de guerra* (Mexicans, Arise to War). Music by James Nunó and words by F. G. Bocanegra.

Netherlands. *Wein Neerlandsch Bloed* (Ancient Blood of the Netherlands) by H. C. Tollens, and the stirring *Wilhelmus van Nassouwe* (William of Nassau).

Nicaragua. Blas Villatas wrote the national song.

Norway. *Sang for Norge* (Song for Norway). The words are by the great Norwegian author, Björnstjerne Björnson.

Persia. *Salamati Shah* (Salute the Shah). Music by A. Lemaire.

Peru. *Somos libres, seámoslo siempre* (We are Free, So Let us Remain Forever).

Poland. *Jeszcze Polska Nie Zginela* (Never Shall Poland Die).

Portugal. The *Portuguese National Hymn* was written by A. Keil. Until Portugal became a republic in 1910, her anthem was *O Patria, O Rei, O Povo* (O Fatherland, O King, O People), written by Dom Pedro who wrote the song in 1822 when he became Dom Pedro I of Brazil. When he succeeded to the Portuguese throne four years later, as Dom Pedro IV, Portugal also adopted the song as its anthem. Brazil, like Portugal, discarded the song as its national anthem when it became a republic.

Rumania. *Traeasca Regale* (Long Live the King). The first move toward a national hymn was the composition of a fanfare for Prince Alexander Johannes Cusa (1820-1873). The winner of the competition begun for this end was Edward A. Hubsch. When Rumania was raised to a kingdom words were written by Vasil Alexander.

Russia. *Boshe Zaria Chrani* (God Save our Noble Czar) was the national anthem of Imperial Russia, written by General Livoff at the command of Czar Nicholas. The general, who was a fine violinist, set the work to words written by Joukovsky, and in 1833 this stately anthem was given to the world.

The Hymn of Free Russia, by Gretchaninoff, superseded the czarist hymn, but the *Internationale* is the commonly recognized song of the entire Union of Socialist Soviet Republics.

Salvador. *Saludemos la Patria* (Let Us Salute our Country). Music by J. Aberle and words by J. J. Canas.

Serbia. *God in His Goodness*, and *Rise, O Serbia.* The words of the former song are said to have been written by Nicholas I of Montenegro in 1867, set to music by Davorin Jenko in 1872. Modern words are ascribed to the Serbian poet, J. Gjorgevic, and adapted to the melody by Jenko.

Spain. Music of *Himno de Riego* (Hymn of the King) was written by Huerta.

Sweden. *Ur Svenska Hjertans djup* (From the Bottom of Swedish Hearts). Music by Lindblad, words by Strandberg.

Switzerland. *Dem Vaterland* (To the Fatherland). Written to the music of *God Save the King*; words by J. R. Wyss, author of *Swiss Family Robinson.*

United States. *The Star Spangled Banner* is the national anthem. It was written by Francis Scott Key on Sept. 14, 1814, when the British were bombarding Fort McHenry. Key went to secure the release of a friend, but was detained all night by the battle, and in the early morning, seeing the American flag still waving from the fort, he took an old envelope from his pocket and wrote the song which he entitled *The Defense of Fort McHenry.* The poem at once spread far and wide. The words were set to music by Ferdinand Durang who used an old air, *Adams and Liberty.* The song at once met with tremendous applause. *America*, although not the official song, is probably the most popular one, the words being by Samuel F. Smith and set to the tune of *God Save the King.*

Uruguay. *Himmo Nacional de la República Oriental del Uruguay.* (National Hymn of the Republic of Uruguay).

Venezuela. *Gloria al bravo pueblo* (A Brave Nation Honored). Music by J. Sandaeta, words by V. Salvias.

Yugoslavia. The national anthem of Yugoslavia is made up of a combination of the Serbian *Boze Pravde*, the Croatian *Liepa Nasa Domvina*, and the Slovene *Napred Zastava Slave.*

NATIONAL CEMETERIES

National Cemeteries were authorized by an Act of Congress, July 17, 1862, and by subsequent acts.

NATIONAL FORESTS

The net area of the National Forests in the United States is estimated at 159,750,520 acres. About 19,026,819 of these are in California, 21,345,925 in Alaska, and some 19,300,773 in Idaho. Twenty-eight of the forests extend into two or more states. The two largest are in Alaska: Tongass, 16,546,242 acres, and Chugach, 4,799,683 acres. Third is Tonto in Arizona, 2,262,044 acres. Among the best known of these forests are the Black Hills in South Dakota and Wyoming; Shenandoah in Virginia and West Virginia; Tahoe in California and Nevada; Umatilla in Oregon and Washington; White Mountains in Maine and New Hampshire; Sequoia in California; Bitterroot, Flathead and Kootenai in Montana; Cascade and Mt. Hood in Oregon; Chelan, Olympic and Rainier in Washington; Big Horn, Shoshone and Teton in Wyoming. Besides all the National Forests, there are State Forests which include more than 10,100,000 acres, a fifth of these being in New York.

NATIONAL LEAGUE OF WOMEN VOTERS

When, in 1920, the amendment giving suffrage to women was added to the federal Constitution, the National American Woman Suffrage Association had achieved its purpose. Led by Mrs. Maude Wood Park, the National League of Women Voters was formed in 1921 to improve citizenship, pass desirable legislation, promote international peace and improve government machinery.

Associated with the National League of Women Voters are many individual leagues from the United States, Hawaii and the District of Columbia. Likewise associated are the National Council of Jewish Women, and the Ladies of the Maccabees.

In 1924 the National League of Women Voters chose from twelve different lines of endeavor the most famous living American women. They include:

Name	*Activity*
Jane Addams	Social reformer
Cecelia Beaux	Portrait painter
Annie Jump Cannon	Astronomer
Carrie Chapman Catt	Suffrage leader, lecturer
Anna Botsford Comstock*	Naturalist, wood engraver
Minnie Maddern Fiske	Actress
Louise Homer	Singer, dramatic contralto
Julia Lathrop	Humanitarian
Florence Rena Sabin	Anatomist
M. Cary Thomas	Educator
Martha Van Rensselaer	Home economist
Edith Wharton	Novelist

*Since 1924, deceased.

NATIONAL MONUMENTS

There are over sixty National Monuments in the United States, over half of which are administered by the National Park Service, the others about equally divided between the Department of Agriculture and the War Department. They were established under a law entitled "An act for the preservation of American antiquities," passed in 1906, which gives the President of the United States authority to declare by proclamation historic landmarks, historic and prehistoric structures and other objects of historic or scientific interest that are situated upon lands owned or controlled by the United States, to be National Monuments.

The National Monuments are varied in character, including battle fields, ruins of archaeological value, caverns, volcanic areas and canyons that are of great geological interest, and places of peculiar beauty. Aztec ruins in New Mexico; Shoshone Cavern in Wyoming; Fort Marion, Florida; Katmai, Alaska, including the famous volcanic area of the Valley of Ten Thousand Smokes; the tract in Tennessee containing the grave of Meriwether Lewis, and the natural bridges in Utah are among the varied types of reservation listed as National Monuments.

Glacier National Park

On the way to the summit in Glacier National Park, Montana. The rugged scenery in this park has been compared with that of the Alps in Switzerland.

NATIONAL PARKS

Both the United States and Canada have designated as National Parks certain areas of great scenic beauty or unusual geologic or historic value in order to preserve them for the people. The Department of the Interior in each country has supervision of the parks which are administered through a Director of National Park Service. The United States has established twenty-two of these parks with others in the making and proposed.

Acadia (formerly Lafayette National Park.) Part of Mt. Desert Island and Schoodic Point, Maine, comprise this park which is an area of 16.72 square miles of woods and of surf-swept rocky seashore; first established in 1919.

Bryce Canyon, established in 1928, preserves the pink cliffs of Bryce Canyon and the surrounding rugged country as a public park. Situated in Utah; 22.60 square miles.

Carlsbad Caverns, established 1930, was a National Monument. It covers 1.12 square miles. See page 1193.

Crater Lake, established in 1902, lies in southwestern Oregon, extending into northern California, and covers 249 square miles. The lake lies in the crater of an extinct volcano.

Everglades (proposed), 1930, in the Cape Sable region, Florida, is being projected.

General Grant. This park was formed in 1890 in order to preserve the General Grant tree, a redwood 40.3 feet in diameter. Christmas festivities are held at the foot of this tree each year, a custom begun in 1925. The park covers four square miles in central California.

Glacier, in northwestern Montana, established in 1910, has an area of 1,534 square miles. It is a rugged mountainous district, resembling the Swiss Alps. There are 250 glacier-fed lakes of great beauty, 60 small glaciers, peaks of peculiar shapes and precipices of great depth.

Grand Canyon, in Arizona, near the Kaibab Forest, preserves the Grand Canyon of the Colorado, one of the greatest examples of erosion in the world. The canyon is noted for its vivid colorings. The park was established in 1919 and covers 1,009 square miles in north central Arizona.

Grand Teton, Wyoming, lies in the Teton Mountains, about eleven miles south of Yellowstone, and borders the Jackson Hole country. The park covers 150 square miles, Alpine in character, with the Great Teton towering in its midst. The country is full of wild life. The park was established in 1929.

Great Smoky Mountains (proposed), 1930. In North Carolina and Tennessee, 248.22 square miles of mountain country.

Hawaii, located in the Hawaiian Islands, was created in 1916. It covers 245 square miles, and includes the volcanoes of Kilauea, Mauna Loa and Haleakala, as well as the great lava lake near Kilauea.

Hot Springs, reserved by Congress in 1832, was established as a park in 1921. It is in the middle of Arkansas, covers one and one-half square miles, and contains 46 hot springs, valued for their curative properties. The flow is over 850,000 gallons a day.

Lassen Volcanic, established in the northern part of California in 1916, has an area of 163.3 square miles. Mt. Lassen continues to steam and is the only active volcano in the United States proper. There are geysers and hot springs, a boiling lake and many active sulphur springs.

Mammoth Cave (proposed), in Kentucky. By 1930 funds for this park had been raised.

48 square miles of glacier, some of it 50 to 500 feet thick. The glaciers are receding slowly. Nisqually and Ingraham are the best known among them, and many of the glaciers are deeply crevassed. There are subalpine wild flower fields, and from the crater of Mt. Rainier still issues enough heat to produce ice caverns and odd ice forms about its edges.

Yellowstone Falls

A view of the superb lower falls, 310 feet in height, in Grand Canyon of the Yellowstone National Park.

Mesa Verde was founded in 1906 in southwestern Colorado and covers 80.11 square miles. Here are found the most notable and best preserved prehistoric cliff dwellings in the United States. Archaeological expeditions have unearthed many finds.

Mt. McKinley, established in 1917 in south central Alaska, covers an area of 2,645 square miles and includes within its limits Mt. McKinley, the highest mountain on the continent.

Mt. Rainier was founded in 1899 and comprises 325 square miles in west central Washington. This is the largest single-peak glacier system accessible and contains 28 glaciers,

Platt was founded in 1902 and is situated in southern Oklahoma. Its one and one-third square miles are covered by sulphur, sodium chloride and other mineral springs, prized for their curative value.

Rocky Mountain was founded in 1915 and lies north of the center of Colorado and comprises 400.52 square miles. It embraces a showy range of peaks in the heart of the Rockies, some of which are 11,000 to 14,255 feet high.

Sequoia, in the east central part of California, was established in 1890 to protect the great trees growing in its 604 square miles. There are within its borders thousands of sequoias of more than 10 feet in diameter. The park contains several mountains, and it is popular for winter sports.

Shenandoah (proposed), in Virginia. In 1930 land was being acquired.

Sully's Hill, in North Dakota, was established in 1904. It is a wooded tract on Devil's Lake, 1.2 miles in area.

Wind Cave took its place among the other National Parks in 1903. It covers an area of seventeen square miles in South Dakota in the Black Hills. There are no lakes or long streams in the region, the chief attractions being the rugged hills and the big limestone cavern that contains passages over ninety miles long, and rooms of great beauty.

Yellowstone, established in 1872, lies mainly in Wyoming but extends into Idaho and Montana, covering 3,426 square miles in all. The park is almost surrounded by great mountains whose tops are snow-covered throughout the year. They are 10,000 to 12,000 feet above sea level, the park itself being largely on a high plateau, 8,000 feet above the sea. The park is now easily accessible to travelers by rail and automobile.

Yellowstone River traverses the park and merges with Yellowstone Lake, then leaves the lake and enters the Grand Canyon of the Yellowstone, through which it passes in a series of waterfalls and rapids. Other rivers in the park are the Gallatin, the Snake, the Madison and the Lewis. Since the Continental Divide passes through the park from northwest to east, some rivers rising in the park drain into the Pacific and others into the Atlantic Ocean. Yellowstone Lake, with an area of about 200 square miles, is the largest of a great number of lakes to be found in the park.

Great evergreens grow below the timber line; there is a variety of flowers in certain areas, and the park is a protected home for many wild animals, including bears of various kinds, moose, elk, deer, antelopes, mountain sheep and wild buffalo herds, as well as those raised on a buffalo ranch.

A great variety of geysers is found in the park. The most famous, Old Faithful, spouts regularly at short intervals. Other active geysers are the Daisy, Riverside, Grand, New (first active in 1928), Beehive, Great Fountain, Imperial, Castle, Giant and Giantess. Many of the geysers bubble and foam; others send up small streams at various angles, while the large ones erupt to a great height. While some are regular in the time of eruption, others are decidedly irregular, and some are regular for a time and then become intermittent.

Wonderfully colored hot springs and mud volcanoes are found in the park. Some of these have brought to the surface vast quantities of white mineral deposits, thus building high terraces over which the hot water runs. Among the best known are those at Mammoth. Many of the basins through the agency of algae, are colored in brilliant reds, pink, green and bluish gray. The surrounding mountains and plateaus are made of volcanic ash and lava, and there is a remarkable petrified forest along the Lamar River in which fossil trees stand upright in the faces of almost perpendicular cliffs rising 2,000 feet above the plateau. The volcanic origin of the region is

the explanation of these petrified trees that were buried for thousands of years and brought to light again by great floods and glacial movement.

Yosemite, established in 1890, is situated in east central California and covers 1,138.78 square miles. River erosion and glaciers in ancient times produced this country of beautiful lakes, mountain peaks 13,000 feet high, lofty waterfalls, valleys, canyons, gorges, cascades and cataracts. The greatest scenic marvels are the Yosemite Valley, the Mariposa Grove of giant trees, Tuolumne Canyon and the Hetch Hetchy Valley. The Waterwheel Falls in Tuolumne Valley throws its waters from fifty to eighty feet into the air. In the Mariposa Grove is the second finest group of sequoias in the country, the greatest tree being the Grizzly Giant, 204 feet high, 29½ feet in diameter and 93 feet in girth. Through Wawona tree runs an automobile road 26 feet in width. The Washington tree is almost as large as the Grizzly Giant, while the Columbia is 294 feet high.

The Yosemite Valley is eight miles long and about a mile wide, and through it flows the Merced River which has a fall of 31 feet in this short distance. After the drop at Ribbon Falls and Bridalveil Falls, the Cathedral Spires, a group of high and pointy rocks, are encountered. Sentinel Rock stands opposite Yosemite Falls. These falls make a vertical drop of 1,430 feet, then 800, and the final plunge of 320 feet brings the water to a low talus of rock at the foot of the precipice. The Vernal Falls, also called Cataract of Diamonds, and the Nevada Falls lie beyond the Yosemite Falls.

Zion, 148.26 square miles in area, in southwestern Utah, was made a National Park in 1919. Zion Canyon, which is 2,500 feet deep in some parts, is the chief feature of this park.

There are also eleven national military parks and other parks under the jurisdiction of the Secretary of War, most of which are historic battlefields.

The Canadian National Parks number over a dozen, *Jasper Park* in Alberta being the largest on the North American continent, 4,200 square miles in area. Established in 1907, it is a mountain wilderness with great peaks, deep lakes, great gorges and canyons within its borders. Mt. Edith Cavell and Mt. Robson are the most famous peaks. Alberta also contains the 2,585 square miles of *Banff Park*, formerly Rocky Mountain Park, in which lie Banff and Lake Louise. On the southern edge of Alberta, adjoining the U. S. Glacier Park, is the 220 square miles of *Waterton Lakes Park*, famed for its snowy peaks, lakes and waterfalls. In Alberta are also *Nemiskam Park*, 8½ square miles; *Wawaskesy Park*, 54 square miles; *Elk Island Park*, at Lamont, 51 square miles, and *Buffalo Park*, at Wainwright, 197½ square miles, famous for its great herds of buffaloes.

In British Columbia are *Glacier Park*, 521 square miles, set aside in 1886 to preserve the Illecillewaet and Asulkan glaciers and the Nakimu caves; *Yoho Park*, 507 square miles, founded in 1886, and containing a natural bridge, Yoho Falls and Emerald Lake; *Kootenay Park*, 587 square miles, including the Briscoe Range and Radium Hot Springs; and *Mount Revelstoke Park*, of 100 square miles, founded in 1916. In Saskatchewan lies *Prince Albert Park*, 1,869 square miles. *St. Lawrence Islands* were set aside in 1904, and total about 180 acres, while *Pt. Pelee Park*, 6.01 square miles extending into Lake Erie is the southernmost point in Canada. These are both in Ontario, as is *Georgian Bay Islands Park*, 29 islands in all, 4.63 square miles. In Manitoba lies *Riding Mountain Park*, 1,148.04 square miles of mountains and forests.

There are several animal preserves and bird sanctuaries, and Fort Anne, in Nova Scotia, and Fort Beausejour in New Brunswick are historic sites set aside as parks. The former is 31 square miles and the latter is 59 square miles in extent. Several areas have been set aside but not yet developed, and there are also a number of great parks maintained by the individual provinces.

The Rainbow Bridge of Utah

The size of this great natural bridge is shown by the inserted photograph of the well-known Flatiron Building of New York City.

NATURAL BRIDGES

There are about fifty great natural bridges in the United States besides many smaller ones. Stream erosion, volcanic action or the constant beating of waves are the principal causes of these formations of natural stone arches. There is a famous Rainbow Bridge in Utah and one of the same name in Arizona.

NAVAL ACADEMY, UNITED STATES

The United States Naval Academy is located at Annapolis, Maryland, where it was established by a special act of Congress in 1845, to give practical and theoretical training to young men for the naval service of the United States. This institution owes its foundation primarily to the untiring efforts of the historian, George Bancroft, Secretary of the Navy at that time.

The students of the Naval Academy are called "midshipmen." There are received at the Academy four midshipmen for each Senator, Representative, Delegate in Congress, and the Vice President, two for the District of Columbia and fifteen appointed each year from the United States at large. The appointments from the District of Columbia and fifteen each year at large are made by the President. The President customarily gives the appointment of midshipmen at large to the sons of officers and enlisted men of the Regular Army, Navy and Marine Corps, because officers and enlisted men, owing to the nature of their duties, are unable to establish permanent residence and thus be in a position to secure nominations for their sons from their Senators and Representatives. The vacancies from the District of Columbia are filled by competitive examination of candidates residing in the District. The selection of candidates, by competitive examination or otherwise, for nomination for vacancies in the quota of Senators, Representatives and Delegates in Congress is entirely in the hands of each Senator, Representative and Delegate in Congress having a vacancy. In addition, 100 enlisted men are selected each year as a result of a competitive examination given to enlisted men of the regular Navy and Marine Corps. The law also authorizes the appointment of twenty-five midshipmen each year from the Naval Reserve and Marine Corps Reserve who attain highest ratings in the competitive examinations. Candidates must not be more than twenty years of age on April 1 of the year in which they are appointed, and who have seen a year of service by July 1 of that year.

An act of Congress approved on June 8,

1926, authorizes that the number of midshipmen now allowed by law at the United States Naval Academy be increased by forty from the United States at large, to be appointed by the President from among the sons of officers, soldiers, sailors and marines of the Army, Navy and Marine Corps of the United States who were killed in action or died prior to July 2, 1921, of wounds or injuries received or disease contracted in line of duty during the World War; provided, that one-half shall be appointed from among the sons of officers and one-half from among the sons of warrant officers, soldiers, sailors and marines of the Army, Navy and Marine Corps. One midshipman is allowed from Porto Rico. He must be a native of that island. The appointment is made by the President on the recommendation of the Governor of Porto Rico. Finally, four Filipinos designated by the Governor-General of the Philippine Islands are allowed to receive instructions at the Naval Academy but are not entitled to appointment at any commissioned office in the United States Navy. All candidates, except the four Filipinos, are required to be citizens of the United States and must not be less than sixteen nor more than twenty years of age on April 1 of the calendar year in which they enter. All candidates must be unmarried, and remain unmarried until after graduation. The course for midshipmen is four years.

Examinations for midshipmen to the Academy are held on the third Wednesday in February and on the third Wednesday in April under the supervision of the Civil Service Commission. A cash entrance deposit of $100 must be made by the candidate on entering. Besides this, $250 necessary for such supplies as uniforms, clothing and text books is advanced by the Government but later deducted from the midshipman's pay of $780 per annum in monthly installments.

The beautiful grounds of the Academy contain 125 major buildings, including officers' quarters. In 1895 a plan of construction and reorganization of new school buildings was commenced. Seventeen years later the Post-graduate School was established. Select officers are sent here for a year or more of advanced training in engineering subjects. In 1927 another graduate course, consisting of a year's study in professional subjects was established. This is followed by a year's course at the Naval War College at Newport, Rhode Island.

NEWBERY PRIZE

The Newbery Prize is a medal awarded annually to the best book for children published during the year in the United States. The medal is named in memory of John Newbery, an early bookseller in St. Paul's Churchyard, London. He encouraged authors to write for young readers, issued small-sized juveniles, and was a friend and patron of Oliver Goldsmith, who is said to have written *Goody Two-shoes* at the instance of Newbery. The award is determined by a special committee of the Children's Librarians Section of the American Library Association, and the medal is the gift of the publisher of *Publishers' Weekly*. The winners of the award since its establishment are:

NEWBERY PRIZE WINNERS

YEAR	AUTHOR	BOOK TITLE
1922	Hendrik Van Loon	The Story of Mankind
1923	Hugh Lofting	Voyages of Mr. Doolittle
1924	Charles B. Hawes	Dark Frigate
1925	Charles J. Finger	Tales From Silver Lands
1926	Arthur B. Chrisman	Shen of the Sea
1927	Will James	Smoky
1928	Dhan Gopal Mukerji	Gay Neck
1929	Erik Kelly	The Trumpeter of Krakow
1930	Rachel Field	Hitty: Her First Hundred Years
1931	Coatsworth	The Cat Who Went to Heaven
1932	Armer	Waterless Mountain
1933	Lewis	Young Fu of the Upper Yangtze
1934	Cornelia Meigs	Invincible Louisa
1935	Monica Shannon	Dobry
1936	Carol R. Brink	Caddie Woodlawn

NOBEL PRIZE

The Swedish inventor and scientist, Alfred B. Nobel, inventor of dynamite, died in 1896, bequeathing $9,000,000, the interest of which should annually be distributed to those who had mostly contributed to the benefit of mankind during the year preceding in the fields of chemistry, physics, medicine or physiology, literature, promotion of international peace. The awards are made by designated committees: the peace award, by a group selected by the Parliament of Norway; physiology or medicine by the Caroline Institute of Stockholm, Sweden; physics and chemistry by the Swedish Royal Academy of Sciences; literature by the Swedish Academy. The value of each prize is $46,299. Both men and women from every nation of the globe are eligible for Nobel prizes. When the committee decides that two or more people have equally contributed to the welfare and progress of the world, the prize is divided.

The first prizes were awarded in 1902 and, except during the World War, most of the prizes have been awarded each year.

OLYMPIC GAMES

When the Roman Emperor, Theodosius, put an end to the ancient Olympic Games in 396 A. D., he stopped a custom that had endured over a thousand years. In fact, the Olympic Games are said to have originated in Greece in 776 B. C. and they were held every fourth year in honor of the great god Zeus. The word "olympiad" came to mean a four-year period. The games were held on the Plain of Olympia in Elis and nearby stood the great temple erected to Zeus and the ivory and gold statue of the god that was counted one of the Seven Wonders of the Ancient World.

All free-born honorable citizens from the Grecian states were invited to take part and, after the Roman domination began, those from other countries were welcomed. Hostilities were suspended during the celebration. The early contests were foot races, but later came the pentathlon, a five-fold contest in which the participants took part in five events, these usually being leaping, running, wrestling, throwing the discus and hurling the javelin. Later still, other events were scheduled. The prizes were simple olive wreaths made from branches taken from the sacred grove back of the statue of Zeus.

After fifteen centuries these games were revived at Athens in 1896, and all the nations of the earth were invited to send chosen representatives. Only amateurs were permitted to contend and the games included most forms of athletics. The modern Olympic Games, like the ancient ones, are held every four years, but take place in different countries. Only during the World War were they suspended. In 1900 they were held in Paris; 1904 in St. Louis; 1908 in Athens; 1912 in London; 1920 in Antwerp; 1924 in Amsterdam; 1928 in Paris.

ORGANIZATIONS

The number of societies and other organizations in the United States is too great to list in its entirety, but the following review notes some of the leading groups. New ones rise to prominence, older organizations become inactive, and there is constant change, so any list must be representative rather than exhaustive.

Aeronautical Chamber of Commerce of America, Inc. An association of those interested in the progress of aeronautics; publishes an authoritative yearbook on that subject.

American Academy of Arts and Letters. A society begun in 1904 and limited to those who have attained distinction in literature or the fine arts. It is an outgrowth of the National Institute of Arts and Letters. Membership is limited to fifty. Somewhat similar in scope to the French Academy.

American Federation of Labor. An organization of the various trades-unions, with headquarters in Washington, D. C. Organized in 1881, its membership in 1930 was over 3,396,000.

American Legion. A patriotic non-military organization of those who served honorably during the World War in the armed forces of the United States. The legion is an outgrowth of a meeting of officers and enlisted men in Paris in 1919, and has local posts which are grouped into departments, of which there is one for each state or territory, Canada, Mexico, the District of Columbia, and Europe.

American Association for the Advancement of Science. The leading scientific association in America, is an outgrowth of the Association of American Geologists. It meets in summer and holds a number of departmental gatherings at that time, each devoted to a different branch of science: mathematics, chemistry, mechanical science and engineering, social and economic science, education, and other sciences. There is a similar society in Great Britain, founded in 1831, some years before the American one was formed.

Audubon Societies, National Association of. An endowed association, named in honor of the pioneer American ornithologist; furthers protection of wild life in America.

Big Brother and Big Sister Federation. Founded in 1917, this is a central group representing eighty-six individual organizations doing club and welfare work with boys and girls in the larger cities.

Boy Rangers. See page 1023.

Boy Scouts. See page 1023.

Camp Fire Girls. See page 1024.

Chamber of Commerce of the United States. A national organization to study business conditions and give information on business matters. Founded in 1912, this organization maintains headquarters in Washington, D. C.

Cincinnati, Society of the. George Washington was first president of this society, formed May 13, 1783, at the last encampment of the Continental army. Membership is hereditary, and numbers about 1,000.

Daughters of the American Revolution. A patriotic society of women organized in 1890 and later incorporated. Its objects are the fostering of patriotism and liberty. There are local chapters throughout the United States and national headquarters in Washington, D. C. The name is commonly abbreviated, D. A. R.

Daughters of the Confederacy, United. A patriotic society of women related to those who served in the Confederate forces. Organized in 1894 at Nashville, Tenn. It maintains local branches in the various states and holds an annual reunion.

Daughters of the Revolution. A group who wished more rigid membership requirements than were demanded by the D. A. R. and who, therefore, withdrew from that society in 1891. Members must be direct descendants from those who took active part in the American Revolution.

Eastern Star, Order of the. A charitable and benevolent society to which only Master Masons or women members of their families are eligible. See also **Masons.**

Elks, Benevolent and Protective Order of. A fraternal organization founded in 1868, an outgrowth of an earlier society composed mainly of members of the theatrical profession. Only one lodge is permitted in a city, and then only if the population numbers over 5,000.

Foresters, Orders of. Known originally as the Royal Order of Foresters, early in the nineteenth century, and carrying out benevolent projects. Various societies have sprung from the original English organization, there being three distinct benevolent orders in the United States, besides several smaller groups.

Four-H Clubs. See page 1024.

Girl Scouts. See page 1024.

Grand Army of the Republic. A patriotic society of members of the armed Union forces in the Civil War, including state militia on active duty. Established in 1866, the membership grew to 409,489, but after that time began to decline as the members died. The name is commonly abbreviated, G. A. R.

Gyrator. An association of local business clubs formed on the principle of Rotary, one member of each line of business being eligible in each club. Better business ethics and practice, good citizenship and business acquaintanceship are the objects. The name is "Rotary," spelled backward, with the initial "G" added.

Izaac Walton League of America is a national organization of sportsmen and sportswomen actively interested in the preservation and restoration of America's recreational areas and the perpetuation of sports in field and stream. This league has done much active work in the preservation of fishing streams and of forests.

Kiwanis International is the union of a large number of chartered Kiwanis clubs in cities throughout the world. Organized in Detroit, Mich., in 1915. Two men are permitted from each business and profession in a city, usually only one representative coming from any one firm. Social and civic service and better business standards are the aims of Kiwanis, together with promotion of good will through better understanding.

Knights of Columbus. A fraternal and beneficiary society of Roman Catholic men, organized in 1882. There are two classes of membership, insurance and associate. Besides the insurance of members, the society devotes itself to promotion of charitable work and vocational education. The ritual requires four degrees before attaining full membership. This organization rendered valuable service during the World War.

Lions Clubs, International Association of. Organized in 1917, this is a group of business clubs similar to Rotary, Kiwanis and Gyrator. The international organization has developed rapidly. Composed of business and professional men, the club activities work to promote civic and social service and good fellowship among its members. The club's motto of five words, the initials of which spell the world "Lions," is: "Liberty, Independence, Our Nation's Safety." The rules of membership permit one representative from each business or profession. An associate of each member may be granted associate membership.

Maccabees. A benevolent, secret fraternal society, with insurance features, organized in Canada in 1878 by members of the Order of Foresters. The local bodies are called "tents" and the main governing body is the "supreme tent."

Masons. The Masonic fraternity is the largest, oldest and most widely distributed secret society in the world. Lodges of Masons are found throughout the world. A few lodges can be traced back to the seventeenth century. The fraternity as it is known today

is an English creation, dating back to London, in 1717. The Masons come down in a general way in English history as operative stone mason lodges, survivals of the guilds which built churches, cathedrals and bridges during the Middle Ages. Masonry was introduced into America in 1730 by the Grand Lodge of England when Dan Coxe, of New Jersey, was made Provincial Grand Master of Pennsylvania, New Jersey and New York.

Although there have been scores of Masonic rites, but five of importance survive. The English rite consists of the first three degrees of Apprentice, Fellowcraft and Master Mason and includes the Holy Royal Arch. The American, or York, rite adds to these three the following four degrees: Mark Mason, Past Master, Most Excellent Master and Royal Arch Mason. These are conferred in Chapters. Those conferred in Councils are: Royal Master, Select Master, Super-Excellent Master. In the Commandery of Knights Templar are conferred the orders of Companion of the Red Cross, Knight of Malta and Knight Templar. At Charleston, S. C., the Scottish rite became one of thirty-three degrees. This organization consists of Lodges, Councils, Chapters and Consistories. The thirty-third degree is composed of active and honorary members.

The Shrine (Ancient Arabic Order of Nobles of the Mystic Shrine) is a social fraternity composed of Commandery or Consistory Masons.

The Grotto is a social fraternity composed of third degree Masons.

Moose, Loyal Order of. A fraternal order that does not carry the compulsory life insurance policy of many similar organizations. It is a secret beneficiary society, pledged to no particular cause, founded in 1888. It maintains a home for needy members, orphans and half-orphans of members and has excellent vocational schools at Mooseheart, Illinois.

National Safety Council. An organization to promote safety practices in school, home, street and factory. It has fifty-nine local councils in large cities in the United States, and publishes safety posters and literature. Over 5,000 unit memberships are maintained, many of these being the single membership of some large industrial institution that subscribes for safety publications in quantity.

Odd Fellows, Independent Order of. A secret and beneficial fraternal society founded in England before the middle of the eighteenth century, was the Odd Fellows, the Independent Order being a seceding group formed in 1809. The American society began early in the nineteenth century, there being some dispute as to the founders. Three degrees are conferred, after which the member is eligible to the encampment where three further degrees are conferred. The highest degree, that of Patriarchs Militant, is open only to those who have received the Royal Purple degree of the encampment. The Rebekah degree for women was started in 1851.

Radio Relay League, American. An organization of amateur radio operators founded in 1915. These amateurs have been instrumental in picking up messages from outlying corners of the earth. Their membership extends into distant parts of the world, and the operators stand ready at all times to coöperate with government agencies in gathering or sending important messages.

Red Cross, American National. In 1859, at the end of the Battle of Solferino, a young Swiss, Henri Dunant, gathered volunteers from the nearby Italian village to help him care for the wounded of all the armies engaged. Afterward he wrote a pamphlet in which he appealed for an organization that should care for those wounded in battle without regard to nationality. As a result, an international conference met at Geneva, Switzerland, in 1864, and adopted what is known as the Red Cross Treaty. This treaty was revised at The Hague in 1906 to provide for the protection of relief societies of any nationality by all other nationalities. In compliment to Dunant the flag adopted was a reversal of that of Switzerland which has a white cross on a red field. Mohammedan Turkey uses a crescent instead of the cross, and calls its organization the Red Crescent Society. Each country maintains its independent organization, but international conferences are held every few years at Geneva, Switzerland.

The Red Cross officiates in disaster relief as well as in war, though its largest work was during the World War. There had been forerunners of the Red Cross, the work of Florence Nightingale in the Crimea and of the Sanitary Commission during the Civil War being in line with Red Cross practice. The American Red Cross, with membership open to any citizen or resident of the United States, numbered 22,000,000 during the World War, with a Junior Red Cross of 8,000,000 school children. Founded in 1881 by Clara Barton, the society went under the supervision of the United States government in 1905.

Red Men, Improved Order of. A beneficiary, benevolent fraternal society organized in 1833 and based upon the manners and traditions of the American Indian. Local bodies are known as "tribes," while the central body is called "the great council of the United States." The ritual is divided into three sections or degrees.

Rotary International. The original Rotary Club was started in the city of Chicago in February, 1905, by a lawyer, Paul P. Harris, who found himself a stranger in a large city where to outward appearances the chief stimulus to human activity was not the Golden Rule but the desire for gold and silver. Mr. Harris decided to found a club wherein the members might not only become acquainted with one another but also devise means of making themselves proficient in thoughtfulness of and helpfulness to each other. He surrounded himself with men, each engaged in a different form of service to the public. This basis of membership still exists in Rotary. The members of the club originally met in rotation at the offices or places of business of the various members, and this suggested the name "Rotary."

Today Rotary stands for better business practices and higher ideals in business and professional intercourse, for service to one's city, state or province, nation and to society in general, and for the development of international understanding and peace. A little more than three years after the organization of the first Rotary Club in Chicago, the second club came into existence in San Francisco, and very shortly after the organization of the second group other clubs came into existence, first on the Pacific coast and later in New York, Boston and other cities in the United States; and then in Canada, England, Ireland and many other countries. In 1910 Rotary International was formed. Since then annual conventions of the associated clubs have been held in the United States, Scotland, Canada, Belgium and Austria. On July 1, 1930, there were 3,349 Rotary clubs with a total membership of over 153,000.

A Rotary Club forms its membership on the plan of one active and representative man from each line of business and profession in the community. Meetings, held each week at luncheon or dinner, are characterized by good fellowship, the development of true and helpful friendships, and the encouragement of the impulse to serve.

The objects of Rotary are to encourage and foster: (1) the ideal of service as the basis of all worthy enterprise; (2) high ethical standards in business and professions; (3) the application of the ideal of service by every Rotarian to his personal, business and community life; (4) development of acquaintance as an opportunity for service; (5) recognition of the worthiness of all useful occupations and the dignifying by each Rotarian of his occupation as an opportunity to serve society; (6) the advancement of understanding, good will and international peace through a world fellowship of business and professional men united in the ideal of service.

Royal Arcanum. A fraternal, beneficiary and benevolent society founded in 1877. Safe insurance at a minimum cost is the chief object of the society.

Salvation Army. A religious society founded by William Booth in England in 1865 as a means of giving spiritual and material aid to people not reached through the usual channels. The Salvation Army was started in the United States in 1880, and beside its religious work the organization has developed many social relief features in the poorest parts of cities, and now has hotels and hospitals, employment bureaus, food kitchens and prisoners' aid work in many centers of population. The Salvation Army rendered valuable service during the World War.

Tammany, Society of, or Columbian Order was formed in 1789, being the effect of a popular movement in New York, having primarily in view a counterweight to the so-called "aristocratic" Society of the Cincinnati. It was essentially anti-Federalist or Democratic in its character, and its chief founder was William Mooney, an upholsterer, and a native-born American of Irish extraction. It took its title from a noted, ancient, wise, and friendly chief of the Delaware tribe of Indians, named Tammany, who had, for the want of a better subject, been canonized by the soldiers of the Revolution as the American patron saint. The first meeting was held May 12, 1789. The act of incorporation was passed in 1805. The Grand Sachem and thirteen Sachems were designed to typify the President and the Governors of the thirteen original states. The society is nominally

a charitable and social organization, and is distinct from the general committee of the Tammany Democracy, which is a political organization.

United American Mechanics is a secret benevolent and benefit society with patriotic and political aims. Founded in 1845, its membership is open only to native-born Americans. It fosters the display of the American flag on schoolhouses, and opposes any union of church and state.

United Confederate Veterans. A federation of various organizations of former members of the fighting forces of the Confederacy, formed in 1890 to preserve material for authentic history, promote fellowship and care for widows and orphans of comrades.

United Spanish War Veterans. A patriotic society of those who took part in the Spanish-American War, the Philippine insurrection, and the Chinese expedition. This society was formed in 1904 by the union of four separate societies of veterans.

United Workmen, Ancient Order of. A fraternal, beneficiary society founded in 1868. Full membership is attained after three degrees, and the society issues insurance to members.

Veterans of Foreign Wars of the United States. A national society of ex-service men who have taken part in campaigns upon foreign soil or in foreign waters; open to army, navy and marine corps men. Organized in 1899, its objects are to foster patriotism, care for needy veterans or their families, and provide comradeship.

Volunteers of America is a religious society with a military organization like that of the Salvation Army and devoted largely to care of the needy. It was organized in 1896, at New York City, by Commander and Mrs. Ballington Booth, the former being the second son of the founder of the Salvation Army.

Woman's Christian Temperance Union is an organization of women, founded at Cleveland, Ohio, in 1874, to fight the liquor traffic. It later expanded its activities to influence other matters affecting human welfare, including habit-forming drugs. Due to Frances E. Willard, long its leader, an international association was formed in 1883.

Woodcraft League. See page 1025.

Woodmen of America, Modern. A fraternal, beneficiary society started in 1883, with insurance features for its membership of over a million.

Woodmen of the World. A fraternal, beneficiary society, founded in 1890, with insurance for its members.

Young Men's Christian Association. This organization was founded in 1844, in London, by George Williams, to promote the spiritual, intellectual, social and physical welfare of young men. The World's Alliance, with headquarters at Geneva, Switzerland, unites the Y. M. C. A. groups throughout the world. In the United States the Y. M. C. A. was founded in 1851. It has national headquarters in New York City, combining about 1,500 associations and nearly a million members. The Y. M. C. A. of Canada maintains central headquarters in Toronto and has over seventy associations and about 50,000 members.

Young Men's Hebrew Association, founded in 1874, at New York City, has branches in many cities. Its objects are the mental, moral and physical welfare of Jewish young men.

Young Women's Christian Association. In 1855 two movements started in England, quite independently of each other, but both designed to serve young women. One, started in the south of England by Miss Robarts, was a prayer union; the other, founded by Lady Kinnaird, in London, opened homes and institutes for business women. Thirty-two years later, in 1887, these two societies merged in the Y. W. C. A., which retains the ideals of both original societies and has spread over the Christian world. It was not until 1906 that the National Board of Young Women's Christian Associations was formed to unite and unify the various groups, and to advance the physical, social, intellectual, moral and spiritual interests of young women. The membership of the association in the United States is over 60,000. Biennial conventions are held. Many of the local groups support residences for their members, and others maintain lunch rooms, gymnasiums and swimming pools, in addition to doing educational and nonsectarian religious work.

Zonta is a business women's organization, similar in form to Rotary. It has clubs in various cities with a central organization, admits only one woman in any line of business to each local club, holds weekly noonday meetings and stands for ethical business practices and good citizenship. Zonta has a number of clubs in Canada and one in Vienna, Austria. The first "classified" club for women was Quota. There are also Altrusa and Siroptomist.

PASSION FLOWER

Early Spanish missionaries in America named the passion flower, which they fancied to be a representation of our Lord's passion. The flower grows in tropical America and in the southern part of the United States.

The leaf is symbolic of the spear that pierced His side. The five anthers are the marks of the wounds; the tendrils, the cords or whips; the column of the ovary, the upright of the cross; the stamens, the hammer; the three styles, the nails; the filamentous process, the crown of thorns; the calyx, the glory or halo; the white tinge, purity; the blue tint, heaven. The passion flower remains open for three days, and typifies His three years' ministry.

PASSION PLAY

A play that portrayed the sufferings and death of Christ was made a part of the Good Friday ritual of the Catholic Church and developed into the passion plays of the thirteenth century. During the fifteenth century these plays developed into great pageants and were given in many towns in Europe, often lasting a week or more. The passion play is still given in some villages in the Tyrol and southern Bavaria, but the one best known in modern times is that at Oberammergau, a small town forty-five miles southwest of Munich, in the valley of the Ammer. To this little mountain village every tenth year go crowds of people to see the passion play given today as it has been for over three centuries. In the year 1633 the district was plague-ridden and Oberammergau lost 84 of its 600 inhabitants. Then the members of the council went to the village church and there made a solemn vow to hold the passion play every ten years from then on. And it is recorded that not another inhabitant died from the plague thereafter.

Because of this vow the play was performed the following year, 1634. After the performance in 1674 the people decided to give it again in 1680 and keep it on the decennial. The only exceptions have been the years 1811, 1815, 1871 and 1922. During these centuries the community and the church shared the heavy expenses of giving the play, and the people, some 700 in all, gave their services. Even today, with great throngs of people from all over the Christian world gathering to see this medieval mystery drama of the Passion of Christ, the expenses are heavy. When there is a surplus, the actors receive one-fourth, and the remainder is divided between local charities, civic improvements and the church. Tradition forbids married women to take part and only men and maidens of unquestioned integrity are permitted in the play, so that it is considered an honor to take part. This group of villagers who are wood carvers, shopkeepers, housekeepers, butchers and bakers have built up a tradition and each tenth year a play is given by them that is the essence of beauty and reverence and simple faith. A number of the actors have taken their parts until too old for them. Thus Anton Lang, the Christus of earlier years, became the speaker of the prologue and one of the disciples in 1930. Many a young girl has delayed her marriage until after the play in order to take her part therein.

PASSOVER

This most solemn festival of the Jewish people is in commemoration of the night when the Lord, smiting the first-born of the Egyptians "passed over" the homes of the Jews and spared their children. The celebration is during the full moon of the month of Nisan, corresponding to the March of the Gregorian calendar. It begins on the fourteenth day of Nisan, the extremely orthodox Jews celebrating for eight days instead of seven. It begins, as do all Jewish holy days, at sundown on the evening before the date given. The father of a family sits at the head of his table and recites the story of Passover, while before him are several dishes of food symbolic of the flight, and these are partaken of at stated times. They include matzoth, or unleavened bread, to commemorate the unraised dough carried in the hurried flight from Egypt; a roasted lamb bone and roasted egg to symbolize the burnt offerings made for their deliverance; horseradish or bitter herbs to represent the bitterness of life under the Egyptian rule, and a stiff paste of apples, nuts and spices to typify the mortar used by the Jews in their heavy toil during their captivity. Before the holiday begins there are special dishes brought forth for cooking and serving and no leavened bread is permitted in the house during the days of Passover.

PATENTS

A government grant to an inventor, securing to him for a stated time the exclusive right to make, use or sell any new and useful machine, manufacture, process or new composition of materials is called a "patent." It also permits the patentee to sell or authorize others to use his patent. Improvements on existing machinery and processes may be patented. Every article protected by a patent must be marked with the word "patented" or "pat'd" and also the date of patent issue or serial number.

The Patent Office is one of the oldest branches of the federal government, provided for in the Constitution itself. In 1790, Congress created the first patent commission and after some time came Samuel Hopkins to take out the first patent issued in the United States, protecting a new process for making pot- and pearl- ash. After that, the requests for patent came faster and faster until now about 200 a day are applied for. Americans hold a third of the patents issued by civilized nations, all of which have some form of patent grant. An international agreement protects an article that has been patented in one country from infringement in another.

Not every new idea is patentable, for it must be deemed useful as well as original in order to be given protection. The present American system was established in 1836 and revised in 1870. It became the model for other countries. There is a thorough examination as to the usefulness and novelty of each idea submitted, and then it is checked to avoid duplication. The person applying for a patent must submit a written description and drawings of his invention and pay a small fee when he applies. If the patent is granted he is then protected for seventeen years in the enjoyment of his idea, and frequently works out improvements before the end of that time that can also be patented and so protect him for a further number of years. That is, if he makes a paper-cutting machine that is much used, and a dozen years later makes an improvement on his first model, he can be granted a patent on the improvement. When the patent for the original machine runs out, suppose someone else does begin making it? They will not be able to sell the machine without the improvement, and that is still protected.

PATRON SAINTS

During the Middle Ages those saints that were supposed to watch over and protect the interests of particular persons, places and trades were known as Patron Saints. The following is a list of some of the more prominent of these:

Place	*Patron Saint*
Aberdeen	St. Nicholas
Antwerp	St. Norbert
Austria	SS. Colman and Leopold
Brussels	St. Gudule
Cologne	St. Ursula
Edinburgh	St. Giles
England	SS. George and Mary
Flanders	St. Peter
France	SS. Mary, Michael and Denis
Genoa	St. George
Germany	SS. Martin, Boniface and George
Holland	St. Mary
Ireland	St. Patrick
Italy	St. Anthony
Lisbon	St. Vincent
Milan	St. Ambrose
Naples	St. Januarius
Paris	St. Genevieve
Portugal	SS. Sebastian, James and George
Prussia	SS. Mary, Adalbert and Andrew
Rome	SS. Peter and Paul
Russia	SS. Nicholas, Andrew, Wladimir and Mary
Scotland	St. Andrew
Spain	SS. James the Great, Michael, Thomas à Becket and Edward
Venice	SS. Mark, Justina and Theodore
Vienna	St. Stephen
Wales	St. David

PAWNBROKER'S SIGN, ORIGIN OF

It is generally held that the three golden balls used by pawnbrokers as a sign were adopted from the armorial bearings of the Medici family of Italy by the Lombard merchants, among whom were several representatives of that family. This sign was used in London in very early times by some of those merchants who had emigrated from Italy and established the first money-lending establishments in England. The Medici coat of arms, in turn, seems to have been derived from the golden bezants, coins received by the crusaders as payment for their services.

PEAT

Peat is a deposit formed in bogs by the decay of vegetable matter, frequently consisting almost entirely of sphagnum, or bog-moss. In composition it differs from coal only in the relative proportion of its constituents. Thus, peat contains: carbon, 55.62 per cent; hydrogen, 6.88; oxygen and nitrogen, 37.50; while coal consists of: carbon, 88 to 94 per cent; hydrogen, 2.5 to 5.5; oxygen, 2.5 to 6.0. Peat forms extensive deposits in various parts of northern Europe, notably in parts of Ireland, where it is commonly known as "turf," and is largely used as fuel.

PHONOGRAPH

When Thomas A. Edison invented the phonograph in 1877, he reversed the principle whereby the telegraph works. Sound is the result of vibrations in the air and when these are brought in contact with a thin, flexible diaphragm, this vibrates in response. Reversing this idea, if a flexible disk is made to vibrate in like manner, vibrations of the air will result. These, striking on the ear, produce what we call sound.

In order to record sound, Edison attached a cutting needle to the center of a diaphragm and allowed it to rest against a cylinder covered with tin foil. Voice and music then created vibrations of air to which the delicately poised needle responded; the cylinder was rapidly revolved and the needle cut a spiral path around it. A strong magnifying glass would show that this path was one of humps and depressions of varying size. Then, by reversing the process, with the cylinder set turning and the needle resting in the groove already cut, it reproduced in sound its own recording, loud or soft according to the depth it had cut into the cylinder.

The modern commercial method of making records is upon a wax cylinder or disk. Graphite, which is a conductor of electricity, is placed upon the wax record and copper electroplates can then be made. The electroplate is then covered with nickel to make it more permanent. This is the master record, from which is made a second master record. This latter serves as a mold from which many other records are produced for sale.

One of the problems that has arisen in the development of the phonograph has been to eliminate the scratching sound of the needle in passing over the disk. An effective method causes the vibration to pass through a tube containing substances which eliminate the short waves of scratching sounds.

An application of this same principle is found in the modern dictaphone to which business correspondence is dictated. Correspondence is rapidly dictated and impressions are made on a wax composition cylinder. This cylinder is then changed to a transcribing machine and the dictation reproduced.

The phonograph is a modern miracle. The magnificent voice of Caruso and other great singers will live forever because of this invention. The most beautiful music of the age is thus carried to the most remote corners of the earth. Music and languages are also taught by means of the phonograph. It is a great gift to the blind. Collections of graphophone records are being made which will preserve for posterity the customs, folklore and speech of the people of our age.

PHOTOGRAPHY

Photography is the process of producing pictures by the action of light on substances that have been sensitized by the use of various chemicals. The action of light on chloride of silver was discovered in the sixteenth century. Thereafter men experimented with the new process, but it was not until 1727, when J. H. Schultz succeeded in photographing writing, that definite results were obtained. Schultz prepared a level surface with a mixture of chalk and silver nitrate and over this laid the translucent paper on which he had written. The sun's rays passed through the paper, blackened the silver compound, and the first true negative had been produced.

Sir Humphry Davy and Thomas Wedgewood began experimenting with photography and in the course of their work Davy discovered that silver chloride was more sensitive than the nitrate. They produced copies of pictures by means of the action of light, but it was not until 1814 that a permanent photograph was produced by Niepce, a Frenchman. In 1839, Louis J. M. Daguerre produced his daguerreotype. This exposed a silver-coated copper plate to the fumes of iodine, and silver iodide was formed on the surface. When exposed in the camera no picture was visible on the plate, but when treated with vapor of mercury the image emerged. It was in 1840 that Draper, an American, made the first daguerreotypes of the human face. These pictures, like Daguerre's, were positive prints and could not be used for printing duplicates.

In 1841, Talbot patented his calotype process whereby a paper negative produced many copies of a picture. Professor Bond, of Cambridge, Mass., first photographed the heavens, in 1851. In the same year Archer brought out the process whereby sensitive silver salts are produced in a film of collodion placed on a glass plate. The present modern dry plate of the silver bromide gelatin wash was basically discovered by Maddox in 1871. George Eastman, in 1884, introduced a film of paper, and three years later Goodwin patented the transparent celluloid film which is the basis of our modern roll film. This

was done by placing a wash of gelatin over the film or glass plate containing the bromide and iodide of silver.

Today the camera has gone to every part of the known world. Pictures of the north and south poles, undersea life taken in the depths of the ocean, pictures of mines far below the surface of the earth, and views taken from airplanes high in the air carry their story to every corner of the earth.

A camera usually consists of a tightly closed box with a small tube in front containing the lens. A shutter in this tube is opened or closed to permit light to come in when desired. In order that the lens may be moved nearer or farther from the back, a bellows similar to an accordion is used. The distance behind the lens at which the image is formed depends both on the kind of lens used and on the distance of the object from the camera. Therefore the front of the camera must be adjusted until the photographer, looking in his finder, can see the desired image clearly or "focused" properly. Sensitized glass is at the back of the camera. The image of the picture to be taken appears upside down on this glass. The farther the object to be photographed is from the camera the greater the distance must be from the back of the camera to the lens in front. The lens is shut and the film or plate placed near the back of the camera. When ready to take the photograph, the lens is opened for a short space of time and the image exposed on the film or plate. This plate or film is then taken into a dark room in which there is only orange or red light. The plate appears the same as before until it is washed in the developer. It is next washed in sodium hyposulphite. Then, upon looking at the plate in the light, the image appears backward. The positive print of the picture is made by placing the plate over sensitized paper and exposing it to the light. Where the plate is dark the positive print is light. This photographic paper is washed in a fixing solution, stretched and dried, and the photograph is completed.

The white light of the sun is composed of all the colors. The blue and violet rays produce most of the photographic power of light, while the red and orange rays have little effect. Red objects appear as black, blue objects as white. By using filters or screens which separate light into its violet, green and red parts, photographs can be made in natural colors.

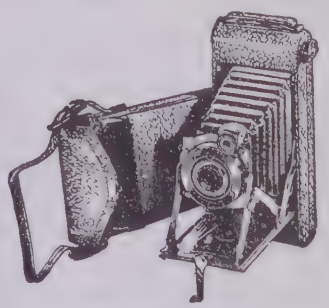
The camera can detect objects not visible to the eye. Time exposures have discovered stars that man has never seen in the heavens; mapping cameras in airplanes have shown the topography of lands still inaccessible to travel; the instantaneous picture records details of action that would escape an onlooker.

Principles of Photography for Beginners. The modern camera with its easily-handled shutter and roll of film makes photography simple for the amateur. The beginner is satisfied to get a clear picture of the view or person he tries to photograph. His camera makes records of persons and things, so that the collections of amateur photographs are a diary in picture form. But when the amateur begins to want beauty, realizes that sharp detail is not usually as desirable as getting the spirit of the subject and the mood of the scene, he begins to do artistic work. Before a photographer can get satisfactory results he must know certain facts about his camera, its use, and the first stages of dark room procedure.

Time. All pictures are made by time exposure. The question is one of how much time to allow. The "instantaneous" exposure in the average small camera is about one-

Home Photography

twenty-fifth of a second. With care, a camera may be held steadily enough in the hand for this exposure, but a longer time exposure requires a tripod or other firm support to hold the camera. The photographer should practice with an empty camera, open so the flash of light can be seen through the shutter. Counting can be tried until the amateur has control of one-fifth second, one-half second or any number of seconds in opening and closing the shutter. One-fifth second is about the time that it takes to move the exposure lever quickly from one end of the slot and back again to its original position, with the shutter adjusted for time exposure, or when it is set for a "bulb" exposure. The lens collects the reflected rays of light from every object before it, crosses these, and then brings them back in proper order, but reversed, and it is



Vacation Photographs

Safely carried in a case, the camera provides a treasured record of vacations.

thus that they reach the plate or film. The amateur must learn to notice whether the objects to be photographed are light or dark, from what direction the light strikes them, and also whether the day is light or dark, clear or misty, for these all have their effect on the time required for getting a good picture.

Aperture. Every camera has some means of controlling the amount of light that goes through the lens. Evidently the larger stops, or light openings, let in more light than the small stops, and the greater the light the more quickly the work is done. With a three-stop camera, use the largest stop opening for snapshots of all ordinary outdoor subjects such as nearby subjects in open field, park or garden, street scenes or ordinary landscapes. Such pictures should be made with the subjects in the direct sunlight, and during the time between two and one-half hours after sunrise and two and one-half hours before sunset. The smaller the opening the greater the detail, so it is occasionally worth while to use the smallest stop opening, place the camera on a steady, firm support and make a short time exposure.

Light. When making ordinary snapshots, the subject should be in the open sunlight, but the camera must not. The sun should be behind the photographer's back or over his shoulder. If it shines directly into the lens it will blur and fog the picture. When making portraits out-of-doors with the sun shining brightly, it is best to have the subject

Folding Camera

A popular type for the amateur photographer.

in the shadow of a building or a large tree, but with clear and unobstructed sky overhead. By following this rule, unpleasant and distorting shadows on the face will be avoided.

In general, one should expose for the deepest shadows in his field of view, rather than for the brightly lighted spots. Few pictures are hopelessly over-exposed, but under-exposure is an everyday occurrence.

When making indoor portraits, near a bright window, with reflection and portrait attachment, use the middle-sized opening, distance three and one-half feet between subject and lens, and expose from four to ten seconds according to the light. Interior views should be made from three hours after sunrise until three hours before sunset. Exposure should be from about four seconds to about five minutes and twenty seconds, according to color of walls, number of windows and kind of light outdoors. Pull down the shades facing the camera.

Developing Negatives. Development is simple if care is taken and the following equipment provided.

(1) A dark room is required, with a light photographically safe. Such a light comes through red or orange glass. Windows should be darkened and a red bulb put in the electric light socket and around it an orange cloth or paper. A candle lantern or enclosed kerosene lamp can be made safe with orange or ruby

glass. (2) The developing solution can be bought ready for use with exact directions on the package. In measuring, it is well to remember that an ordinary drinking glass holds eight ounces. (3) The acid fixing powders or hypo solution keeps indefinitely and should be used until it loses its effectiveness in clearing a film. One of the indications of exhausted hypo is its tendency to become frothy when stirred. Fixing powders, unlike hypo, can be used only on one roll of film. (4) Directions for developing roll film come with film tanks, but in order to see the pictures come in the negatives, three trays may be used in a dark room with safe light. Tray 1 contains developer solution, Tray 2 contains rinsing water, and Tray 3 holds acid hypo. To use these, take the film out of its wrapper and off its spool. Holding it at each end, wet it in Tray 2, which contains water only, to avoid staining. Then draw back and forth, film or emulsion side down—the film is on the inner side of the roll—through the developer in Tray 1 until the high lights (that is, the dark spots of the negative) are heavy on the film side and show through fairly clearly on the back. This takes about five or six minutes. Rinse by drawing similarly a few times through Tray 2. Fix with same motion in Tray 3 until the negative is clear, with no trace of milkiness on the back. The film should be left in the fixing bath four or five minutes after it has cleared. Wash the film for about half an hour in running water, or for five minutes each in six changes of water. The films must be moved about during the time of washing to separate them and insure thorough washing.

Drying. Hang the film up to dry. To keep it from rolling and twisting, clip a straight edge of some sort, perhaps a piece of stiff cardboard, on each end.

Photographic Papers. Beginners had best use a paper that is cheap, slow enough to control, and selected to fit the purpose. For dense, flat, or thin negatives that lack contrast, a different paper is needed than that used for good, average negatives, or for obtaining softened prints from negatives that show sharp contrasts. For each type of negative and for each sort of print the proper paper should be used.

Printing. When the films are dry, cut them into single negatives. Lay the printing frame glass side down, take out the cover, put in the first negative, with emulsion or dull side up, and against this place a sheet of paper, emulsion down, and clamp the cover on. Expose to a lamp. Remember that the two sensitized surfaces come together, making a print by actual contact. A sheet of dry photographic paper almost always shows some tendency to roll with emulsion side inside. The two sides of the dry paper feel unlike to the touch. If these tests do not satisfy, bite the corner of the paper and the emulsion, or sensitive side, will stick to your teeth. This is an unfailing test.

In printing, hold the frame at a distance from the lamp equal to the diagonal of the negative. A postcard negative, for example, may be held six and one-half inches from the light. With a sixty-watt lamp, ordinary negatives print in about ten to fifteen seconds. If the negative lacks contrast, it is better to underprint a bit and prolong the development. Economy suggests the use of trial strips to determine the printing time, until one becomes expert in judging negatives. If one side of the negative is stronger than the other, hold the printing frame obliquely towards the light in order to favor the darker area. If the dense areas, or weak spots, are local in the middle of the negative, for instance, a "dodger" may be kept in motion over the thin area, to protect it during part of the exposure time. By the use of a "dodger" and double printing, clouds may be introduced from special cloud negatives into landscapes otherwise bare at the top.

Developing Prints. Developing prints requires about the same process as developing negatives. If the prints develop too fast they are probably over-printed. Time should be cut for the next print. Rinse the print and place it in a fixing bath similar to the one that was used for the film. The same bath should not be used for both films and prints.

Unless all the hypo is washed out of the print it will slowly fade and discolor. Prints will not wash in contact with each other. They must either be kept moving by running water or must be individually handled through about six or eight changes of water, leaving the prints in each change for five minutes. Transfer the prints separately from one tray to another to insure thorough washing. Dry the prints by spreading them out, picture side down, on any clean cloth surface. Cheesecloth frames make the quickest driers, but it is often easier to spread the prints on bed covers.

Trimming. Avoid as much trimming as possible by studying the composition of each picture before making the exposure. The next best thing is to make a set of printing masks, one by one as needed, so that each print has a margin and includes only what is essential to the picture. But if a print is badly proportioned and has bald sky, barren foreground or unnecessary detail at the sides, trim it.

Mounting. Photographic albums are convenient, but if each picture is to show on its own merits, it should be mounted separately. In mounting prints, either on cards or in albums, dry mounting tissue is the most satisfactory adhesive.

PHRENOLOGY

Phrenology is a hypothesis of Dr. F. J. Gall (1758-1828), a German physician, and afterward expounded and developed by his pupil, Dr. Spurzheim. It is based on four fundamental statements: (1) The brain is the organ of the mind. (2) The mental faculties can be analyzed and reduced to a definite number. (3) Different parts of the brain are appropriated to these different mental faculties. (4) Capacity and character are indicated by the external form of the skull.

According to early phrenologists, the mind was divided into twenty-six faculties, associated with a corresponding number of areas on the cranium. Later these were increased to forty-three faculties.

The hypothesis of phrenology has today no standing among scientists. It is here recorded only as an item of historical interest, since science has proved that the surface of the skull is no index to either mind or character.

PLYMOUTH ROCK

On December 22, 1620, the Pilgrim Fathers set foot on a bare rock on the bleak coast of Massachusetts Bay. This rock became known as Plymouth Rock, and is to New England what the Palladium was to ancient Troy, or the shield of Minerva to Athens. In course of time the rock became broken into two pieces. One part remained in its original position at Hedge's Wharf, Plymouth; the other was taken to the center of the town and surrounded by an iron railing. This portion which had been dragged into Plymouth in 1774 was, in 1880, returned to its original position.

POTTER'S FIELD

This was a piece of ground which, according to the statement in Matthew, xxvii. 7, was purchased by the priests with the thirty pieces of silver rejected by Judas, and converted into a burial ground for Jews not belonging to the city. Here is the passage: "And they took counsel and bought with them the potter's field to bury strangers in." With us the term "potter's field" denotes the ground where unidentified persons and the bodies of unclaimed paupers are buried.

PRESS ASSOCIATIONS

The beginnings of a news agency that gathered news and sent it out to various subscribing newspapers began about 1830, when several New York newspapers combined to gather shipping news for their common use. There are three types of news distributing agencies. The Associated Press is a coöperative service, the members sharing the expenses between them. No newspaper is a member of the Associated Press, some individual on each paper taking the membership. The United Press is probably the largest of the news agencies that are on a strictly commercial basis, selling its news to its member-newspapers. International News Service, Universal News Service, and Scripps-McRae Press Service are other agencies of this type. There is also the news agency that sends out propaganda of a business or political nature, and this is sent free as a general rule, although some services charge a small fee.

The Associated Press and the Canadian Press work in close coöperation and receive foreign reports from such European press agencies as Reuter's in Great Britain, Wolff in Germany, Havas in France, and also from their own special agents located in large cities all over the world. The news agencies began their great growth when the telegraph became a practical machine, and again a forward thrust was felt when the cable was perfected. Wireless has increased the news-gathering power of the agencies by connecting them with the world's outposts.

PRINTER'S DEVIL

The origin of this term is ascribed to the fact that in the early days of printing the apprentice's duties included the inking of the forms with bags containing ink or besmeared with it. In the performance of this work his face and hands became so daubed with ink that in appearance he suggested the devil. Hence the name.

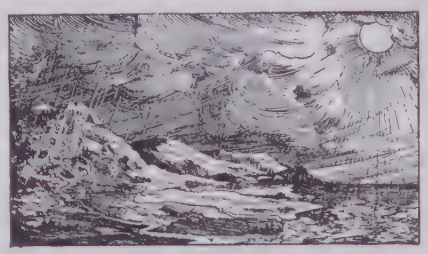
PRINTING PRESSES

The printing press, as we know it, was invented shortly before Columbus discovered America. Men had painted and cut records on stone in prehistoric days, and many books and scrolls were hand lettered before and during the early Christian centuries. Block printing followed, each letter being carved on wood and the whole impression then made on paper. When men learned to carve each letter on a separate block and move these blocks about to be used in various combinations a great step forward was made. Johannes Gutenberg is generally credited with having invented and used movable metal types which he cast from a type mold. Some claim that Coster, a Dutchman, was the inventor of movable types. In any event, the discovery was made about 1450 A. D. and was used in Mainz, Germany. When that city was captured in war, the men who knew the secrets of the new printing process were scattered abroad and carried their presses with them.

Suddenly, printing came into general use. The first presses were crude affairs. The type, held in a frame, was set in a wooden press; the surface was inked by passing ink-soaked balls of feathers or of wool-filled leather over the type faces, and after the paper was laid on, a heavy plate or platen was screwed down to ensure a firm, even impression upon the paper. The printers learned to produce beautiful books by this slow method. Whole families, generation after generation, used the same process.

The first printing press in the United States was set up at Harvard College, Cambridge, Mass., in 1639, and was the start of what today is *The University Press*. But no radical improvement was made in printing presses until near the end of the nineteenth century. Earl Stanhope, of London, invented the iron press in 1798; Clymer, of Philadelphia, invented the Columbian hand press in 1816, doing away with the screw; König, a Saxon, working in England, created the continuously revolving cylinder press in 1811.

Then, in 1846, Richard M. Hoe, a young American, built a two-cylinder press that could produce 20,000 copies an hour, printing one side of the paper. In 1865, William Bullock, of Philadelphia, built the first machine to print from a continuous web or roll of paper using the huge rolls of cheap paper made possible by Fourdrinier's invention of a paper-making machine in 1827. Utilizing this new paper roll, in 1871, Hoe produced his web press, a rotary perfecting press using forms that were cylindrical in shape and that printed as rapidly as the paper could go through. This machine printed on both sides of the paper at a rate of 12,000 an hour and was the beginning of modern rotary press printing which permits sixty-four pages of a modern newspaper to be passed through the presses at the rate of over 100,000 an hour, printing and folding the whole paper. Modern presses gear several of these unit presses together and a newspaper plant in a large city uses several 12-unit presses to handle its work. But the underlying principle is that of the Hoe press of 1871.



There have been improvements in printing methods since the days of Hoe, but probably the most important have to do with type-setting. The old method of setting type by hand has given way to the machine, the typesetter operating a keyboard to set his lines of type. Only special work and a few fine books are now set by hand. (See **Linotype; Monotype.**)

PULITZER PRIZES

Joseph Pulitzer, who was publisher of the *New York World*, donated funds for annual awards to be given for the best publications in certain lines. The prizes range from $500 to $2,000 in amount and are awarded for the best American novel, play, book of poetry, historical work relating to the United States, cartoon, most outstanding example of newspaper reporting, most outstanding editorial, and the best biography teaching patriotic and unselfish service. The first awards were made in 1917, and have been given annually since then.

RAIN

Rain is the fall of water in drops from the clouds, or the drops which fall. A cloud consists of water vapor, the individual units of which are very small. The heat of the sun draws the water into the air in the form of vapor and this gradually unites to form clouds. Rainfall takes place when the vapor condenses and grows heavy. Several tiny particles of vapor unite and then the action of gravity makes them fall, and we have rain. Twenty inches of rainfall a year is considered a minimum for ordinary agriculture. Walfisch Bay, West Africa, has only three-tenths of an inch of rain a year. The heaviest fall is in parts of India where 450 inches fall annually and the air is always damp and debilitating.

The Water Cycle

The sun draws the water upward in the form of water vapor, and clouds are the result. With condensation, rainfall ensues, completing the water cycle.

RAINBOW

A luminous bow or arch appearing in the clouds opposite to the sun when they are resolved into rain. Theoretically several bows may co-exist; generally, however, there is but one. Sometimes there are two, very rarely three or even four, which is the largest number authentically on record. Every rainbow exhibits the prismatic colors. When there are two bows, the lower, or primary, is very bright, and has the red highest; the outer, or secondary, is more faint, and has the violet the highest color. Rainbows are produced chiefly by the refraction and dispersion of the light in passing through the raindrops, partly also by its reflection from the back of the drops, without which the appearances would not reach the eye. The secondary bow ceases to be visible when the sun is fifty-four degrees above the horizon.

Red Cross. See **Organizations.**

RED LETTER DAYS

As a long-standing custom, church calendars indicate holy days and saint's days, by the use of red ink. Hence the phrase "red letter day" means one of great joy to be long remembered.

RED TAPE

Official and public documents are often tied with red tape and Lord Minto is said to have been the first to use the phrase "red tape" in 1775, to signify official formality and delay.

RHODES SCHOLARSHIPS

Rhodes scholarships were founded by the will of Cecil John Rhodes which provides in perpetuity for the support at Oxford University for a term of three years each of about 176 selected scholars from British colonies, the United States and Germany. The scholarships were apportioned: Rhodesia, 9; Cape Colony, 12; Natal, 3; Australia, 18; New Zealand, 3; Canada, 6; Newfoundland, 3; Bermuda, 3; United States, 2 for each state and territory, a total of 104; Germany, 15. The scholarships have an annual value of 300 pounds each and are donated for the purpose of bringing about a more complete unity of the English-speaking race.

The German scholarships, of 250 pounds each, were added when the former kaiser made the study of English compulsory in German schools. When the war was declared against Germany, an act was passed in 1916 transferring the German scholarships to Alberta, Saskatchewan, the Transvaal, the Orange Free State and alternately to Kimberly and Port Elizabeth. Awards were suspended during the World War.

Those receiving the scholarships are not restricted as to subjects to be studied. They may work for the degree of Bachelor of Science, Bachelor of Literature or Doctor of Philosophy, or, if not already prepared for these, they may enter any of the Oxford Honor Schools.

All those between the ages of 19 and 25 who are unmarried and have had at least two years of college training may compete. An applicant may try for the scholarship in his own state or that in which he has received the greater part of his education. Selections are made by the committee in each state appointed for that purpose and based on the candidate's record in school and college according to scholarship, character, interest in outdoor sports, and interest in one's fellows and instincts for leadership, which were the points outlined in the Rhodes will.

ROSE FESTIVALS

Battle of Flowers. In Nice, France, originated this celebration in carnival time. People drive along the principal street, saluting friends by throwing flowers at them, and being pelted in return. This custom was adopted by many other European cities and may take place any time in April, May or June.

Rose Festival. In early June of each year, Portland, Ore., famed for its beautiful roses, holds its Rose Festival. At this time the roses are at their best. Athletic games, a water celebration and a magnificent display of roses are presented.

Tournament of Roses. In 1890, the City of Pasadena, Cal., inaugurated this celebration, held on January 1 each year, in which the gorgeous flowers of California play an important part. People come from every part of the earth to witness the display of flowers, flower-covered carriages and automobiles, floats, and the football games and races. Many other cities of southern California take part in this pageant.

RUBICON

The Rubicon was the ancient name of a small stream, known today as the Fiumicino, in Italy. It formed the boundary between Italy and Cisalpine Gaul. It is celebrated from Cæsar's having hesitated about crossing it with his army and initiating civil war in the year 49 B. C. When Cæsar came to the river he paused upon the brink, but finally saying, "The die is cast," spurred on his horse, and dashed into the water. Hence, to "pass the Rubicon" denotes the taking of the first step in a momentous undertaking from which one cannot or will not recede.

S O S

The radio distress call letters, "S O S" have no meaning in themselves. They were selected by the International Radiotelegraph Conference at London in 1912 because the combination of dots and dashes—three dots, three dashes, three dots—was so simple that the most inexperienced radio operator would have little difficulty in detecting it. Before 1912 the distress call was "C. Q. D." The words "Save Our Ship" or "Save Our Souls" have been given as the meaning of the distress call, but U. S. Naval Communications is authority for the statement that the "S O S" letters stand for no words.

SABBATH-DAY'S JOURNEY

A Sabbath-day's journey, according to Dr. Adam Clark, was seven and one-half furlongs, or about 1,650 yards. The rabbis fixed it at 2,000 cubits, which is about 1,350 yards. Josephus says that the Mount of Olives was five stadia, or 625 paces, from Jerusalem, which would make the allowable Sabbath-day's journey about 1,050 yards.

SABBATICAL YEAR

The ancient Israelites were compelled by law to let their fields lie fallow every seventh year in order to allow the land to enrich itself. Even the crops were left ungarnered to be turned back later into the ground. Adapting this idea, a number of colleges and universities grant members of their faculties a long vacation, approximately every seventh year, for study, travel and rest, in order that they may return with fresh ideas and energy.

SALUTES

Salute to the Union. This is one gun for each state, and is commemorative of the Declaration of Independence. It is fired at noon of the Fourth of July, at every military post, and on board commissioned naval vessels belonging to the United States.

The National Salute is twenty-one guns. This is the salute for the national flag, the President of the United States, presidents of foreign republics, or sovereigns of foreign states, visiting the United States.

The Vice-President of the United States, American and foreign ambassadors receive a salute of nineteen guns.

The President of the Senate, Speaker of the House of Representatives, members of the Cabinet, the Chief Justice, a Congressional Committee, Governors within their respective states or territories, Viceroy or Governor General of provinces belonging to foreign states, a General of the Army, an Admiral of the Navy, and same ranks in foreign armies and navies are given a salute of seventeen guns.

American or foreign Envoys, Ministers Plenipotentiary, Assistant Secretaries of the Navy or War, a Lieutenant General, or a Major General commanding the army and corresponding ranks in the navy, and foreign armies and navies are accorded a salute of fifteen guns.

Ministers-Resident accredited to the United States, a Major General, a Rear-Admiral, and corresponding ranks of foreign armies and navies receive a salute of thirteen guns.

Charges d' Affaires, a Brigadier General, a Commodore, and corresponding ranks in foreign armies and navies are given a salute of eleven guns.

Consul Generals accredited to the United States receive a salute of nine guns.

Salutes are fired only between sunrise and sunset, and not on Sundays, except in international courtesies. The national colors are always displayed at the time of saluting. The salute of the flag is the only one which is returned, and this must be done within twenty-four hours. United States vessels do not return a salute to the flag in United States waters if there is any fort or battery there to do it, nor do United States vessels salute United States forts or posts.

If there are several batteries or forts within sight or within six miles of each other, one of them is designated as the saluting fort, and returns all salutes of foreign men-of-war. In New York, Castle William, on Governor's Island, is the saluting fort.

SANTA CLAUS

The children's Christmas deity in the United States is Santa Claus, a corruption of St. Nicholas, or Klaus, the Dutch form used in Holland, and later in New Amsterdam, for the patron saint of children. He was, in life, the Bishop of Myra in Lycia, Asia Minor, and died in 345 or 352 A. D.

SCIENCE, THE FIVE FOLLIES OF

These are usually said to be: The squaring of a circle; the establishment of perpetual motion; the philosopher's stone; charmation, or the discovering of secrets by magic; and judicial astrology.

SCYLLA AND CHARYBDIS

Scylla is a rocky cape on the west coast of south Italy, jutting out boldly into the sea so as to form a small peninsula at the northern entrance to the Straits of Messina. About the beginning of the fifth century B. C. a fort was built upon the rock (which is about 200 feet high, and much hollowed out below by the action of the waves), and in course of time a small town grew up, straggling down the slopes toward the sea. The navigation at this place was looked upon by the ancients as attended with immense danger, which, however, seems to have been much exaggerated, for at the present day the risk is no more than attends the doubling of any ordinary cape. Charybdis, now called Galofaro, is a celebrated whirlpool in the Straits of Messina, nearly opposite the entrance to the harbor of Messina in Sicily, and in ancient writings always mentioned in conjunction with Scylla. The navigation of this whirlpool is, even at the present day, considered to be dangerous, and must have been exceedingly so to the open ships of the ancients, so that, having escaped one peril at Scylla, mariners had to face a second one at Charybdis. Hence the phrase, "between Scylla and Charybdis" is used figuratively to mean "between two perils."

SEVEN WONDERS OF THE ANCIENT WORLD

The Seven Wonders of the Ancient World were: the Pyramids of Egypt, the Colossus at Rhodes, the Temple of Artemis (Diana) at Ephesus, the Pharos, or Lighthouse, of Alexandria, the Hanging Gardens at Babylon, the Statue of Zeus (Jupiter) at Olympia, and the Mausoleum at Halicarnassus. The Walls of Babylon are sometimes listed as an alternative seventh. The Seven Wonders are faithfully depicted in colors as a frontispiece to this Book of Useful Miscellany (opp. p. 1181).

The Pyramids are numerous, and were constructed of blocks of red or syenitic granite, and of a hard calcareous stone. These blocks were of extraordinary dimensions and their transportation to the sites of the pyramids and their adjustment in their places indicate a surprising degree of mechanical skill. The Great Pyramid covers an area of between twelve and thirteen acres. The masonry consisted originally of 89,028,000 cubic feet, and still amounts to about 82,111,000 feet. The present vertical height is 450 feet, against 479 feet originally, and the present length of the sides is 746 feet, against 764 feet originally. The total weight of the stone is estimated at 6,316,000,000 tons.

The Colossus at Rhodes. The city of Rhodes was besieged by Demetrius Poliorcetes, King of Macedon, but, aided by Ptolemy Soter, King of Egypt, the enemy were repulsed. To express their gratitude to their allies and to their tutelary deity, they erected a bronze statue to Apollo. It was 105 feet high, and hollow, with a winding staircase that ascended to the head. After standing fifty-six years, it was overthrown by an earthquake, 224 years before Christ, and lay nine centuries on the ground, and then was sold to a Jew by the Saracens, who had captured Rhodes, about the middle of the seventh century. It is said to have required 900 camels to remove the metal and from this statement it has been calculated its weight was 720,000 pounds.

The Temple of Artemis (Diana) at Ephesus was built at the common charge

of all the Asiatic states. The chief architect was Chersiphon, and Pliny says that 220 years were employed in completing the temple, whose riches were immense. It was 425 feet long, 225 broad, and was supported by 125 columns of Parian marble (60 feet high, each weighing 150 tons) furnished by as many kings. It was set on fire the night of Alexander's birth by an obscure person named Erostratus, who confessed on the rack that the sole motive which prompted him was the desire to transmit his name to future ages. The temple was again built, and once more burned, this time by the Goths in their naval invasion, A. D. 256.

The Colossal Statue of Zeus (Jupiter) at Olympia was the work of Phidias. It was in gold and ivory, and sat enthroned in the temple for 800 years, finally being destroyed by fire about A. D. 475.

The Hanging Gardens at Babylon appear to have been a magnificent building on the terraced roofs of which were planted trees, flowers and shrubs. This edifice is supposed to have been built by Nebuchadnezzar for the gratification of his Median Queen, because the Babylonian plain seemed dreary to her in comparison with the mountain scenery of her native land. According to Strabo the structure was a square, four plethra in area; it rested on arches supported by hollow pillars of burnt brick, filled with earth, in which roots of trees were planted; the top consisted of terraces, and a force of men constantly pumped water from the Euphrates River for irrigation.

The Pharos, or Lighthouse, of Alexandria is on a rocky island off the western extremity of the Egyptian coast opposite the town of Rakotis. When Alexander chose the site of Alexandria, he connected the island with the mainland by the Heptastadium or Seven-furlong Mole. This made it possible to build two harbors. Hence, on the eastern side of the island Ptolemy I began the erection of a great lighthouse which was completed by his son, Ptolemy Philadelphus. The lighthouse was a lofty tower with a square base. Light was furnished by a beacon fire on the summit. After this lighthouse had stood nearly 1,600 years one side was destroyed by an earthquake on August 7, 1303. By 1346 it was completely in ruins. The name of Pharos was borne by at least twenty other lighthouses in the ancient world.

The Mausoleum at Halicarnassus. In the old kingdom of Caria where the Turkish town of Budrum now stands was the city of Halicarnassus. In 377 B. C., Mausolus and his sister-wife, Artemisia, came to the throne. Great prosperity was enjoyed under their rule and considerable sums were spent beautifying the city. When Mausolus died in 353 B. C., his wife immediately set about to honor her husband and preparations were begun for the erection of a tomb.

The sculptors were Scopas Leochares, Bryaxis, and Timotheus. The foundation was laid upon a rock 127 feet from east to west and 108 feet from north to south. Upon this foundation stood a rectangular podium or basement 114 by 92 feet. This supported a pteron, or square stage, with fluted columns of Ionic architecture. Between the columns stood marble statues, and above them was said to be the wonderful frieze with which the greatest artists of the ancient world sought to perpetuate their fame. On one side was sculptured the combat between the Greeks and the Amazons. On another was a battle of the Centaurs. Above the frieze was the cornice with a sculptured lion's head at each of its corners. Next came the frieze, measuring at the base of its longest side about 108 feet. Surmounting the pyramid was a platform about 22 feet long and about 17½ feet wide to support a great chariot. To this were attached four huge horses, each 12 feet long. Within the chariot stood a statue of King Mausolus.

At the beginning of the Christian era, Halicarnassus was almost completely depopulated and the Mausoleum, which still remained, was unguarded. Before the year 1402 a severe earthquake shook the Mausoleum, hurling the chariot group from its pedestal. The pyramid collapsed, the statues of Mausolus and Artemisia were broken and the friezes fell amid the ruins. In the year 1402, when the Knights of St. John of Jerusalem took Halicarnassus, the stones were taken from the Mausoleum to build the castle of St. Peter and the sculptures were converted into lime for cement.

SEWING MACHINE

Since the middle of the eighteenth century, inventors have endeavored to build a machine that would do the work of the needle. Thomas Saint in 1790 produced a model for a successful sewing machine. A Frenchman, Thimonnier, in 1830 built a crude sewing machine with which to make uniforms. His factory was destroyed by a crowd of needle-workers who thought that the machine would deprive them of their occupation. About 1833, Walter Hunt, a mechanic, invented a lock stitch machine with an eye-pointed needle; but he did not realize the value of his invention and sold it to a man who refused to get a patent. In 1853, Hunt himself tried to get a patent but was refused because he had waited so long. In 1846 Elias Howe patented a machine having a needle with the eye near the point and the lock stitch. This was the first really successful sewing machine. Howe's machine worked horizontally instead of vertically, as do most modern machines. John Bachelder, in 1849, patented the first machine with a continuous feed and the horizontal table. This continuous feed was a leather belt holding small steel pins to move the cloth along. In 1854, the four-motion feed which continually moves the cloth along was patented. The first machine with a rigid overhanging arm, a vertical needle making a lock stitch and operated by the foot, was invented by Isaac M. Singer in 1851. The chain stitch machine was invented by a farmer, A. E. Gibbs, and later improved by Willcox.

The sewing machine has been the greatest labor saving device for use in homes throughout the world of any invention of the nineteenth century. Basically, there are two kinds of machine, the lock stitch and the chain stitch. The lock stitch is usually preferred because it does not ravel easily. It uses two threads. The first passes through the eye of the needle and is forced through the cloth and drawn back, leaving a loop below. The second thread is forced through this loop by a shuttle, locking the stitch. The material is pushed forward and another stitch taken. In the chain stitch the loop of each stitch passes through the cloth and by means of a hook secures the loop of the preceding stitch, as in crocheting. A great variety of sewing machines has been developed for sewing clothing, leather, canvas, embroidery, upholstery, making buttonholes, feather-stitching, pattern stitching, tucking, ruffling, smocking and hemstitching. Some machines have two, four, six or eight needles, and some, like the fur-workers' machines, operate horizontally.

SMOKE

Smoke is any volatile, and specially any carbonaceous matter, escaping from a burning substance. Although much smoke is made up of particles of carbon, the composition of smoke depends on what is burned. When wood or coal is in process of combustion, it emits, not merely minute particles of unconsumed carbon, but invisible gaseous matter. Appliances for consuming smoke aim simply at preventing the rise of the carbonaceous particles, ignoring the unseen gases. These appliances attempt to furnish a supply of air containing an abundance of oxygen, the absence of which is the reason why any carbon escapes unconsumed.

SPHINX, RIDDLE OF

A famous enigma of antiquity was the riddle of the Sphinx. The story runs that Juno sent a monster, the Sphinx, to ravage the territory of Thebes. This monster had been taught riddles by the Muses, and she propounded one to the Thebans: "What is that which has one voice, is four-footed, two-footed, and at last three-footed?" or, as some have it, "What animal is that which goes on four feet in the morning, on two at noon, and on three at evening?" An oracle told the Thebans that they would not be delivered from her until they had solved her riddle. They often assembled to try their skill, but as often failed, when the Sphinx always carried off and devoured one of their number. At length Oedipus came forward and gave the correct answer, "Man," who when an infant creeps on all fours, at manhood stands erect on two legs, and in old age hobbles about with the aid of a crutch.

STATUARY HALL

Statuary Hall is the popular name given to the historic chamber in the Capitol formerly used by the House of Representatives at Washington. It is now utilized for the statues of historic Americans.

By the terms of an Act of Congress, approved by President Lincoln on July 2, 1864, the chamber was officially designated as a national Statuary Hall and an invitation was extended to all states to contribute statues. Each state was permitted space for marble or bronze statues of two of her most distinguished citizens, men or women; but no person still living was to be so honored. The table on the following page lists the statues now installed.

STATUES IN STATUARY HALL

STATE	NAME OF STATUE	NAME OF SCULPTOR
Alabama	J. L. M. Curry	Dante Sodini
	Gen. Joe Wheeler	Berthold Nebel
Arkansas	Uriah M. Rose	F. W. Ruckstull
	James P. Clarke	Pompeo Coppini
Connecticut	Roger Sherman	C. B. Ives
	Jonathan Trumbull	C. B. Ives
Florida	John Gorrie	C. A. Pillars
	Kirby Smith	C. A. Pillars
Georgia	Alexander H. Stephens	Gutzon Borglum
	Dr. Crawford W. Long	J. Massy Rhind
Idaho	George L. Shoup	F. E. Triebel
Illinois	James Shields	L. W. Volk
	Frances E. Willard	Helen Farnsworth Mears
Indiana	Oliver P. Morton	C. H. Niehaus
	Lew Wallace	Andrew O'Connor
Iowa	James Harlan	Nellie V. Walker
	S. J. Kirkwood	Vinnie R. Hoxie
Kansas	John J. Ingalls	C. H. Niehaus
	George W. Glick	C. H. Niehaus
Kentucky	Henry Clay	C. H. Niehaus
	Ephraim McDowell	C. H. Niehaus
Maine	William King	Franklin Simmons
Maryland	Charles Carroll	R. E. Brooks
	John Hanson	R. E. Brooks
Massachusetts	Samuel Adams	Annie Whitney
	John Winthrop	R. S. Greenough
Michigan	Lewis Cass	D. C. French
	Zachariah Chandler	C. H. Niehaus
Minnesota	Henry M. Rice	F. E. Triebel
Missouri	Francis P. Blair	Alex. Doyle
	Thomas H. Benton	Alex. Doyle
New Hampshire	John Stark	Carl Conrads
	Daniel Webster	Carl Conrads
New Jersey	Richard Stockton	H. K. Brown
	Philip Kearney	H. K. Brown
New York	Robert R. Livingston	E. D. Palmer
	George Clinton	H. K. Brown
North Carolina	Zebulon B. Vance	Gutzon Borglum
Ohio	James A. Garfield	C. H. Niehaus
	William Allen	C. H. Niehaus
Oklahoma	Sequoyah	Vinnie R. Hoxie
Pennsylvania	J. P. G. Muhlenberg	Blanche Nevin
	Robert Fulton	Howard Roberts
Rhode Island	Nathanael Green	H. K. Brown
	Roger Williams	Franklin Simmons
South Carolina	John C. Calhoun	F. W. Ruckstull
	Wade Hampton	F. W. Ruckstull
Tennessee	Andrew Jackson	Belle Kinney Sholz and L. F. Sholz
Texas	Stephen F. Austin	Elisabet Ney
	Samuel Houston	Elisabet Ney
Vermont	Ethan Allen	L. G. Mead
	Jacob Collamer	Preston Powers
Virginia	George Washington	Jean Antoine Houdon
	Robert E. Lee	Edward V. Valentine
West Virginia	John E. Kenna	Alex. Doyle
	Francis H. Pierpont	Franklin Simmons
Wisconsin	James Marquette	G. Trentanove
	Robert LaFollette	Jo Davidson

STEAM ENGINE

While the practical steam engine dates from the eighteenth century, in the second century B.C., Hero of Alexandria is said to have invented a toy which was revolved by steam. In 1698, Savery raised water by a steam engine. Seven years later Papin added the use of the piston to Savery's invention. The same year Newcomen made the first successful engine wherein pressure was applied to a piston. Humphrey Potter attached cords to the valves and thus invented the first automatic valve gear. But it remained for James Watt to bring about the greatest advance. In a series of inventions he (1) condensed the steam in a condenser, allowing the cylinder to remain hot; (2) covered the cylinder to prevent it from cooling; (3) stopped the entrance of steam when the stroke of the piston was partially made, thus allowing the remainder of the stroke to be accomplished by the expansion of the steam, forcing the piston back by steam entering at the other side of the cylinder; (4) built an air pump to remove the condensed steam and keep a vacuum. Watt developed many other inventions and may well be called "the father of the modern steam engine." His first successful engine was built in 1765.

The first steam engines were for the purpose of pumping water from mines in England, and the usual question upon purchasing a steam engine was how many horses it would replace. Thus came the custom of rating the strength of a steam engine in "horsepower." An engine of one horsepower is able to lift 33,000 pounds one foot in one minute.

The position of the cylinder determines whether a steam engine is "horizontal," "inclined" or "vertical." An engine is classified as "high" or "low" dependent upon its speed, medium being 150 revolutions per minute. If the exhaust is directly into the atmosphere it is called a "non-condensing" engine, but if the exhaust steam is cooled by running water it is a "condensing" engine. A simple engine is one that has a single cylinder and therefore only one expansion. When it has two or more cylinders, therefore two or more expansions, it is called a "compound" engine, and gives more horse power per unit of fuel than a single-cylinder engine. If the motion of the piston is circular the engine is called a "rotary" engine. The connecting rod and crank on a fly wheel attached to a piston moving forward and backward gives a rotary motion.

In a "reciprocating" engine the piston is forced back and forth inside a hollow cylinder by steam acting alternately on both sides of the piston. The steam enters behind the piston by the action of valves. The exhaust is connected with the front part of the cylinder. The piston moves in one direction; then, when the steam is cut off, the piston completes its stroke, and the valve mechanically changes so that the motion is reversed. Although the reciprocating type of engine is far more common, the "steam turbine" engine is more efficient. Here the steam comes through an opening and the steam turbine, being a rotary engine, causes the piston to rotate. Leaving the moving vanes, the steam comes in contact with stationary blades which turn it off against another row of vanes. In 1879 DeLaval applied the turbine to driving a cream separator. In 1884 Parsons built the first successful power turbine.

A boiler is used for heating water to produce the steam for steam engines. These are usually constructed of steel to withstand steam pressure of from 200 to 250 pounds per square inch. The water tube type of boiler has tubes containing circulating water around which the heat is placed. Lowering of the temperature or increasing the pressure on saturated steam results in water condensation. Dry steam is that in which less than three per cent of water is found. The white clouds visible when steam escapes result from water condensation. Steam is transparent, invisible and colorless. Usually there are attached to a boiler: (1) a pump for supplying the boiler with water; (2) a water gauge to show the amount of water in the boiler; (3) a steam pressure gauge; and (4) a safety valve to release steam if the pressure should become too great.

SUBMARINE

The submarine dates from 1620, when Cornelius Van Drebel, a Dutchman in the service of James I of England, is said to have built such a vessel. It was not, however, until 1776 that a submarine was used for war purposes. In 1887, John Philip Holland, an Irish-born American, built a clumsy wooden submersible. For twenty years he worked on his idea, and in 1900 constructed the successful torpedo boat which at once became the model for the American navy's submarines. In France, the first naval submarine, built by Dupuy de Lame, but somewhat modified in design by Gustave Zede was launched in 1888. Soon other submarines were developed, and with the passing years improvements were wrought in this nautical vessel.

Like other types of war craft the submarine has steadily increased in size. The first American boats displaced 120 tons when submerged, while the fleet submarines designed in 1915 had a tonnage of more than 1,500. Similar development also took place in other navies. The British and German ships which made long cruises during the

World War were of 800 to 900 tons displacement.

Submarines are kept on an even keel by ballast tanks and horizontal rudders. The water is moved by compressed air acting on the surface of the water in the tanks and by pumps. The horizontal rudders are operated by hand or by motors.

To submerge a submarine several tanks designated "main ballast tanks" are completely flooded and a less number of smaller tanks are partially flooded. These tanks, when filled, submerge the vessel. To bring the boat to the surface the water is expelled from the tanks by means of compressed air and pumps. The time required to submerge and emerge depends upon the size of the boat, the reserve displacement, and the capacity of ejecting and pumping equipment.

When a submarine nears an enemy it is submerged until only its periscope is visible. This instrument, attached as part of the submarine equipment, permits an outlook on the water when the boat is submerged. The periscope is, however, almost useless at night unless the vessel is at rest.

Up to 1914, submarines were divided into two classes, the patrol and the coastal. The former was of 600 to 800 tons surface displacement with good speed and endurance and capable of detached duties at some distance from its base, while the coastal submarine was of 250 to 400 tons and was intended primarily for the defense of naval ports and bases. Later, the fleet submarines, to accompany fleets, and the cruiser submarine with a relatively powerful gun armament were introduced. Besides these may also be added the monitor submarine, the mine-laying submarine and the submarine-destroyer submarine, the names of which clearly indicate the purposes for which they are used.

TELEGRAPH

The telegraph is, in the broadest sense, an instrument for sending signals to a distant point. The American Indians sent news by placing a blanket over a fire and allowing clouds of smoke to arise in accordance with a definite signal system. At the beginning of the American Revolution, signal lanterns were placed in the belfry of Old North Church. Two lanterns announced the coming of the British by sea; and one, by land. Napoleon used the heliograph whereby flashes of sunlight from mirrors or highly polished metal carried signals to distant points. Our navy still uses the changing of position of the arms of a semaphore to send messages. Thus the telegraph is not altogether modern. It has come, however, to be restricted to the conveying of signals by electric transmission.

A telegraph system is made up of a line of wire, a steady supply of electric current, a key for transmitting signals and a sounder whereon the signals may be heard. One wire between stations is sufficient because each terminal may be connected with the ground and thus a complete circuit is made. A transmitter simply opens and closes the electric circuit. Pressure on the key closes the circuit. Release of the key allows a spring to lift it and breaks the circuit. The current flows and stops upon the closing and opening of the circuit. Electricity travels so fast that the signal is received upon the sounder thousands of miles away in the fraction of a second. This sounder is made of two electromagnets with a piece of steel attached close to their ends. These cause an arm to strike a brass plate and the current is opened and closed. Thus a sound is caused both from the closing and opening of the circuit upon the sounder. The period of time between the up and down sound is the signal system. A "dot" is a short space of time, a "dash" a longer space of time. The Morse code, using dots and dashes, is used throughout the world. In the United States and Canada spaces are also used as well as dots and dashes.

Samuel F. B. Morse is considered the inventor of the electric telegraph although many others previously made scientific research along the same line. The Morse telegraph was first publicly used in 1844, although invented earlier.

One problem in modern telegraphy has been to increase the number of words that may be sent over a wire each minute. Automatic sending machines are capable of transmitting 350 words a minute. However, by using currents which differ in strength and direction or both, the multiplex system permits many messages to be sent in both directions over the same wire at the same time. Sending-machines today with keyboards like typewriters send messages which are automatically printed by the receiving machine.

The telautograph is an elaboration of the telegraph. By this invention the receiving pen writes exactly the words written by the sender on the transmitter. The telautograph is especially useful in hotels, railroad stations, and large business houses. This invention also permits the transmission of pictures, maps and charts.

TELEPHONE

On February 14, 1876, Alexander Graham Bell applied at the United States Patent Office for a patent on a method of reproducing sounds at a distance by means of electricity. Two hours later Elisha Gray of Chicago also filed an application on a very similar device. The patent was granted to Bell and he is therefore considered the inventor of the telephone. After a long legal battle the United States Supreme Court upheld Bell's patent.

The telephone consists of a transmitter, batteries or other sources of direct electrical current, an induction coil, and a receiver connected by copper wires.

When we speak into the sound-sensitive transmitter of a telephone the sound waves which spread in every direction strike the thin metallic diaphragm and cause it to vibrate in uniformity with the waves. This disk is part of a circuit having a current of electricity, and the current is affected by the different vibrations of the diaphragm. Electric impulses are thus created in the wire and are carried very quickly to the other end of the wire regardless of distance. Passing through electromagnets, these electric impulses cause the magnets to make an iron disk vibrate exactly like the transmitting diaphragm against which the sound was made. This latter operation is in the receiver of the telephone. The vibrations caused in the air produce the same sound as was uttered so accurately that it is easy to recognize the voice of a friend thousands of miles away.

A telephone exchange is the means by which telephone calls are connected. Each line has a hole in the switchboard and near each hole is a small electric light. When the

receiver is taken from the hook of a telephone this small lamp lights. The operator then places a wire in the hole and secures the number desired. The other end of the wire is also placed in the hole of the number of the telephone wanted and a switch rings the bell of the telephone desired. When the receiver of the telephone is hung up a light flashes on the switchboard and the operator removes the connecting wire.

Telephone users may call one another without the aid of an operator. The person calling sets this automatic exchange system in motion by lifting the receiver and moving a dial to letters and numbers indicating the number called, allowing it to return to its starting position after each number or letter. Then without human aid the machinery in the switchboard selects the desired line and causes the bell to ring which may be heard at both ends. On a busy line a buzzing signal is given. Thus, when one desires to call number 582 a pencil is placed in the hole numbered "5" of the dial and pulled as far to the left as possible, then allowed to return to its former position, the "500" trunk line is thus connected. When "8" is likewise pulled, connection is made with the "80" trunk line. When dialing number "2," connection with an individual line is made.

The first successful telephone was shown at the Centennial Exposition in Philadelphia in 1876 and aroused great interest. The first telephone exchange was in New Haven, Connecticut in 1878. In the United States there are now more than 10,000 telephone companies, although most of these are associated with the Bell System which originally secured the patents of Dr. Bell. Over sixty per cent of the telephones in use in the world are in the United States. As tremendous improvements have been made in the telephone in the past, so they are expected for the future. Large departments of research are devoted to constantly improving the telephone.

Telephoning and telegraphing are now carried on without wires and both are included under the term "radio," which is the subject of a special article, beginning on page 955.

THIRD DEGREE

A system used by the police to compel a suspected criminal to tell the truth. The suspect is constantly questioned over a long period of time until his strength of will and mind are so exhausted that he no longer withholds the facts. The authorities favor the third degree on the grounds of necessity and justice, although serious accusations of cruelty have often been made against the police, because of this form of extracting information from a suspect.

THUNDER

Thunder is the violent report which follows a flash of lightning. It commences the same moment as the flash; but as the sound travels at the rate of only about 1,100 feet a second, while light moves at the rate of 186,000 miles, the flash of the lightning is the first to be perceived. Thus a means is afforded of calculating the distance of the lightning. The noise of the thunder arises from the disturbance produced by the sudden expansion of the air in the path of the lightning discharge. The amount of lightning generated and its force both affect the loudness and length of the thunder peal. When the distance is considerable the sound becomes rolling, due to the reflection from ground, clouds, high buildings and other reflectors of sound.

TINKER'S DAM

The expression, "tinker's dam," indicates utter uselessness and originates from the little heap of clay or dirt which a tinker or plumber, in repairing a leak or soldering a joint places around the soft, heated solder until it cools and hardens. This dam of clay can never be used again and is thrown away as worthless.

TIP

A tip is a gift given to servants for services. Many explanations are given as to how this word originated. One is that it is made of the initials of the three words "to insure promptness." Another, that a slight "tip" or tap on the arm by a servant is a gentle suggestion that a gratuity be given. The English used the word also for a small money gift to a child, especially to a schoolboy.

TRADE-UNIONS

A trade-union is an association of workers in the same trade who are banded together for the purpose of maintaining satisfactory working conditions. They are interested in wages, hours, sanitary regulations, apprenticeship, restriction of output, collective buying, their legal rights, arbitration of disputes and conciliation. Many trade-unions also provide insurance for their members, unemployment allowances, social and educational opportunities. Whether or not the modern trade-union is a descendant of the guilds of the Middle Ages, both forms of association worked for the betterment of conditions of work. Great strides have been made in collective bargaining and in coöperation between employer and employee groups, since the beginning of the twentieth century. There are fewer strikes and lockouts.

The "strike," or refusal to work by the group regularly employed at certain tasks, is the union's weapon to gain its ends when demands are refused. A "sympathetic strike" is a strike made by members of the union not directly affected by the matter under dispute, who strike in order to enforce the demands of their striking mates. A "boycott" is a combination of people to withhold all business dealings with an individual or organization. It is a refusal to sell to or buy from the one who is boycotted. In both strikes and boycotts attempts are made to influence coöperation from others outside the union or group involved. The employer may use as a weapon in labor disputes the "lockout," which deprives the workers of their work with him. There is a growing tendency toward arbitration in labor disputes, a number of unions maintaining joint boards of arbitration and conciliation on which are representatives of both worker and employer, together with persons not connected with either side, who are chosen by both sides.

While there were unions in America long before the Revolution, there was a great increase in their number and strength between 1792 and 1810, and the first central organization of unions was formed at Philadelphia in 1827, the Mechanics Union of Trade Associations. Six years later, twenty-nine trade organizations formed the New York Trades Union. Other cities followed suit and in 1834 the unions of six cities met in convention and formed the National Trades-Union. It should be noted that a trade-union includes individuals who work at the same trade, while a trades-union is made up of unions in various trades.

There are a number of national trade-unions, the printers having formed the first national group in the Typographical Union in 1850, followed by the stone cutters three years later. Then, too, before 1870 two national organizations were formed that admitted workers of any trade. These were the National Labor Union, founded in 1866, and the Noble Order of Knights of Labor, started in 1869 as a secret society, but this phase was soon discontinued. In 1881 the Federation of Organized Trades and Labor Unions of the United States and Canada was founded at a meeting in Pittsburgh, and five years later this organization joined with other groups to form the American Federation of Labor, the "A.F. of L." which today is the great labor organization, composed of groups in all trades in America. Certain groups, such as the railway unions, the Amalgamated Clothing Workers, and the Industrial Workers of the World, (an organization of revolutionary character), maintain separate organization. The largest single organization within the American Federation of Labor is the United Mine Workers of America, with a membership of over 400,000, while the organization as a whole has about 3,000,000 membership. The British federation has about the same total membership.

TRAIN SIGNALS

The following signals are displayed to the rear of every train:

By day the marker lamps are not lighted.

By night, while running on a single track, with the current of traffic on a double track and with the current of traffic on passenger tracks where there are three or more tracks, green lights are displayed to the front and side, and red to the rear. When on a siding, to be passed by another train, green lights are shown to the front, side, and rear.

A train running by night with the current of traffic on slow speed track, where there are three or more tracks, displays green to the rear on the side next to the high speed track in the direction of the current of traffic, and a red light on the opposite side.

The rear of a train running by night on any track against the current of traffic where there are three or more tracks, displays green to the rear, with a red light on the platform or the cupola.

Cabooses equipped with revolving signal lamps on cupolas display green when running at full speed. Red is displayed at the moment speed is reduced and until full speed is resumed, except when the train is on a siding clear of the main track, when green is displayed.

The following signals are displayed to the rear of every train, as markers, to indicate the rear of the train: by day, marker lamps (not lighted); by night, green lights to the front and side, and red lights to the rear, except when the train is clear of the main track, when green lights are displayed to the front, side and rear. When a train is turned out against the current of traffic, green lights are shown to the front and side, a green light to the rear on the side next to the main track on which the current of traffic is in the direction the train is moving, and a red light to the rear on the opposite side.

All sections except the last display two green flags and, in addition, two green lights by night in places provided for that purpose on the front of the engine.

Extra trains display two white flags and, in addition, two white lights by night in the places provided for that purpose on the front of the engine. A blue signal displayed at one or both ends of an engine, train, or car signifies that workmen are under or about it; when thus protected, it must not be coupled to or moved. Each class of workman displays the blue signals and the same workman is alone authorized to remove them. Other equipment may not be placed on the same track so as to intercept the view of the blue signals without first notifying the workmen.

Color Signals. Red indicates: Stop.

Yellow indicates: Proceed at restricted speed. (Other uses prescribed by the rules.)

Green indicates: Proceed. (Other uses prescribed by the rules.)

Green and white indicates: Flag stop.

Blue indicates: Workmen busy about train. (Other uses prescribed by the rules.)

Purple indicates: Stop indication for dwarf signals.

The explosion of two torpedoes is a signal to proceed at restricted speed. The explosion of one torpedo indicates the same as two, but the use of two is required.

TRANSPORTATION

Since man was created he has moved about from place to place, carrying his possessions with him. Gradually he sought methods that would relieve him of carrying his burdens. He made yokes for his own shoulders that carried weight easily, and soon transferred the yoke to various animals that he

ODD FORMS OF TRANSPORTATION

1—India—Street scene showing ox carts loaded with cotton. **2**—Siam Howda—Traveling in northern Siam via elephant express. **3**—India Cashmere—An inflated ox skin used as a ferry boat. **4**—Drawing water from a native well near Delhi, India. **5**—Burma, Rangoon—Working elephants at Rangoon. **6**—Jamaica. **7**—Ceylon, China—Rickshaws on a country road. **8**—Ceylon—A native peddler selling live poultry. **9**—An Alaskan pack train.

domesticated as beasts of burden. He formed rude sledges on which his loads were pulled over the ground. Then he relegated these to use on snow and ice after he had cut solid and circular pieces of tree trunk to serve as wheels. The ox and the ass pulled wagons and plows in Egypt 2,700 years before the Christian era. The horse, used first in Asia, was transported to Egypt, and thence to Europe, but it was essentially a war animal and not a beast of burden for many centuries. The camel was the transport animal over the deserts, the elephant served in India, the llama in South America, the yak in Tibet, the carabao in the Philippines. The Eskimo used reindeer, and later used dogs also. In Belgium and Holland dogs are still used for lighter burdens and often carry milk through the streets of the towns.

But roads were poor and often dangerous in early times, and men hollowed a tree or inflated a skin and made better progress on a river than they could on their roads. With a flat piece of wood as a rudder and a couple more as oars they moved about, carrying goods from place to place. Civilization sprang up along the waterways; men began to build larger boats and made their slaves row their great galleys from one trading place to another. The Egyptians were the great traders in Biblical days, although by 1000 B.C. the Phoenicians became the important merchants on the Mediterranean, carrying goods to Greece, whence the Greeks took them inland. Then Greece became the greatest of the trader nations, and when the power of Rome rose, she became a still greater trading nation, daring her vessels on the Atlantic. The people of Venice, Genoa and Florence grew rich from trading with the Orient. The Roman Empire was a great road-builder, and though this was done largely for military purposes, the trader followed the soldier, and in his wake went civilization for countless wild hordes of northern Europe.

All this time men had guided their way through forest and over the water by the sun and stars, and it was not until 1300 A.D., when the compass came into use, that man had a reliable aid in direction-finding. The compass allowed men to go farther from known trails on land and sea. Soon Columbus had reached America and Magellan had circumnavigated the globe. But travel was slow. Animal power was used on land and oars were the only means of moving on water when the winds failed to fill the sails. It took months for vessels to sail from London or Paris to New York a century ago.

With the invention of the steam engine came a great step forward in transportation. Both land and water travel were speeded greatly, and much larger loads could be transported than had before been possible. The first stagecoach traveled from New York to Philadelphia in 1756, but men still found it more comfortable to go on horseback, with saddlebags for their goods when they were in a hurry, for roads were bad and coaches and wagons often sank their wheels into mud to their hubs. Thomas Twining, an English merchant from India, came to the United States during Washington's administration and wrote of the bad roads he encountered in his several days' journey by stagecoach from Philadelphia to the new city of Washington. It was because of this slowness of travel in the early days of the Republic that there was such a long wait between the time when a new president was elected and the time of his inaugural. Many weeks were needed less than a century and a half ago for a man to travel a few hundred miles, and so ample time was given for the incoming President to reach the capital.

The Steam Engine

Probably the greatest advance in transportation was due to the development of the steam engine.

The steam engine was probably the greatest agent in improving transportation, but electricity marked another era in transportation advance. Electric street cars and electricity on vessels brought more universal travel and the carrying of goods into smaller communities. Then came the gasoline engine, and the automobile developed into a great factor in transport. The automobile increased the demand for good roads, and all over the civilized world there was road construction and the consequent spread of transportation. The truck and bus began to displace the railroad for short hauls.

The gasoline engine also made possible the practical use of the air. Aeronautics became a fact instead of a mere theory. The discovery of the non-inflammable helium gas for use in dirigibles was another step forward in safe use of air transport. Men have crossed the North American continent by airplane between sunrise and sunset, and a regular passenger service allows a traveler to sleep at a hotel during the night while making a thirty-six hour coast-to-coast journey, covering a distance that the pioneers, in their ox-drawn covered wagons, took several months to achieve.

The oil-burning Diesel engine on steamships is making the firing of engines a clean and easy matter compared with the work of half-naked firemen who toiled to feed coal to the old-style engines. Seaplanes skim the surface of the water and are much used for short distance transportation. A great Zeppelin has circumnavigated the globe and a number of planes have done likewise. Both the North and South poles were reached by Admiral Byrd by airplane, and Captain Amundsen flew over the North pole from Europe to America. Planes are used to carry the mails, passengers, express and other valuable goods, and to bring perishables to market.

The history of transportation tells the history of civilization, for it was the early traders who carried ideas and news from one community to another and gave men a broader outlook on life, a desire for more civilized comforts, and sent them adventuring to the farthest corners of the globe in search of new markets and, incidentally, made of them explorers.

TREES, NOTED

A number of trees are preserved as monuments marking scenes of historic value; but others have perished as a result of disease, or of man's disregard of their worth. The important task of caring for trees is illustrated on the following page. Some of the most noted trees are:

Burgoyne Elm. At Albany, N. Y., associated with the ill-fated British general, Burgoyne, during the American Revolution.

Cary Tree. Planted by the roadside in 1832 by Alice and Phoebe Cary. It is a large sycamore standing on the turnpike between College Hill and Mount Pleasant, Hamilton County, Ohio.

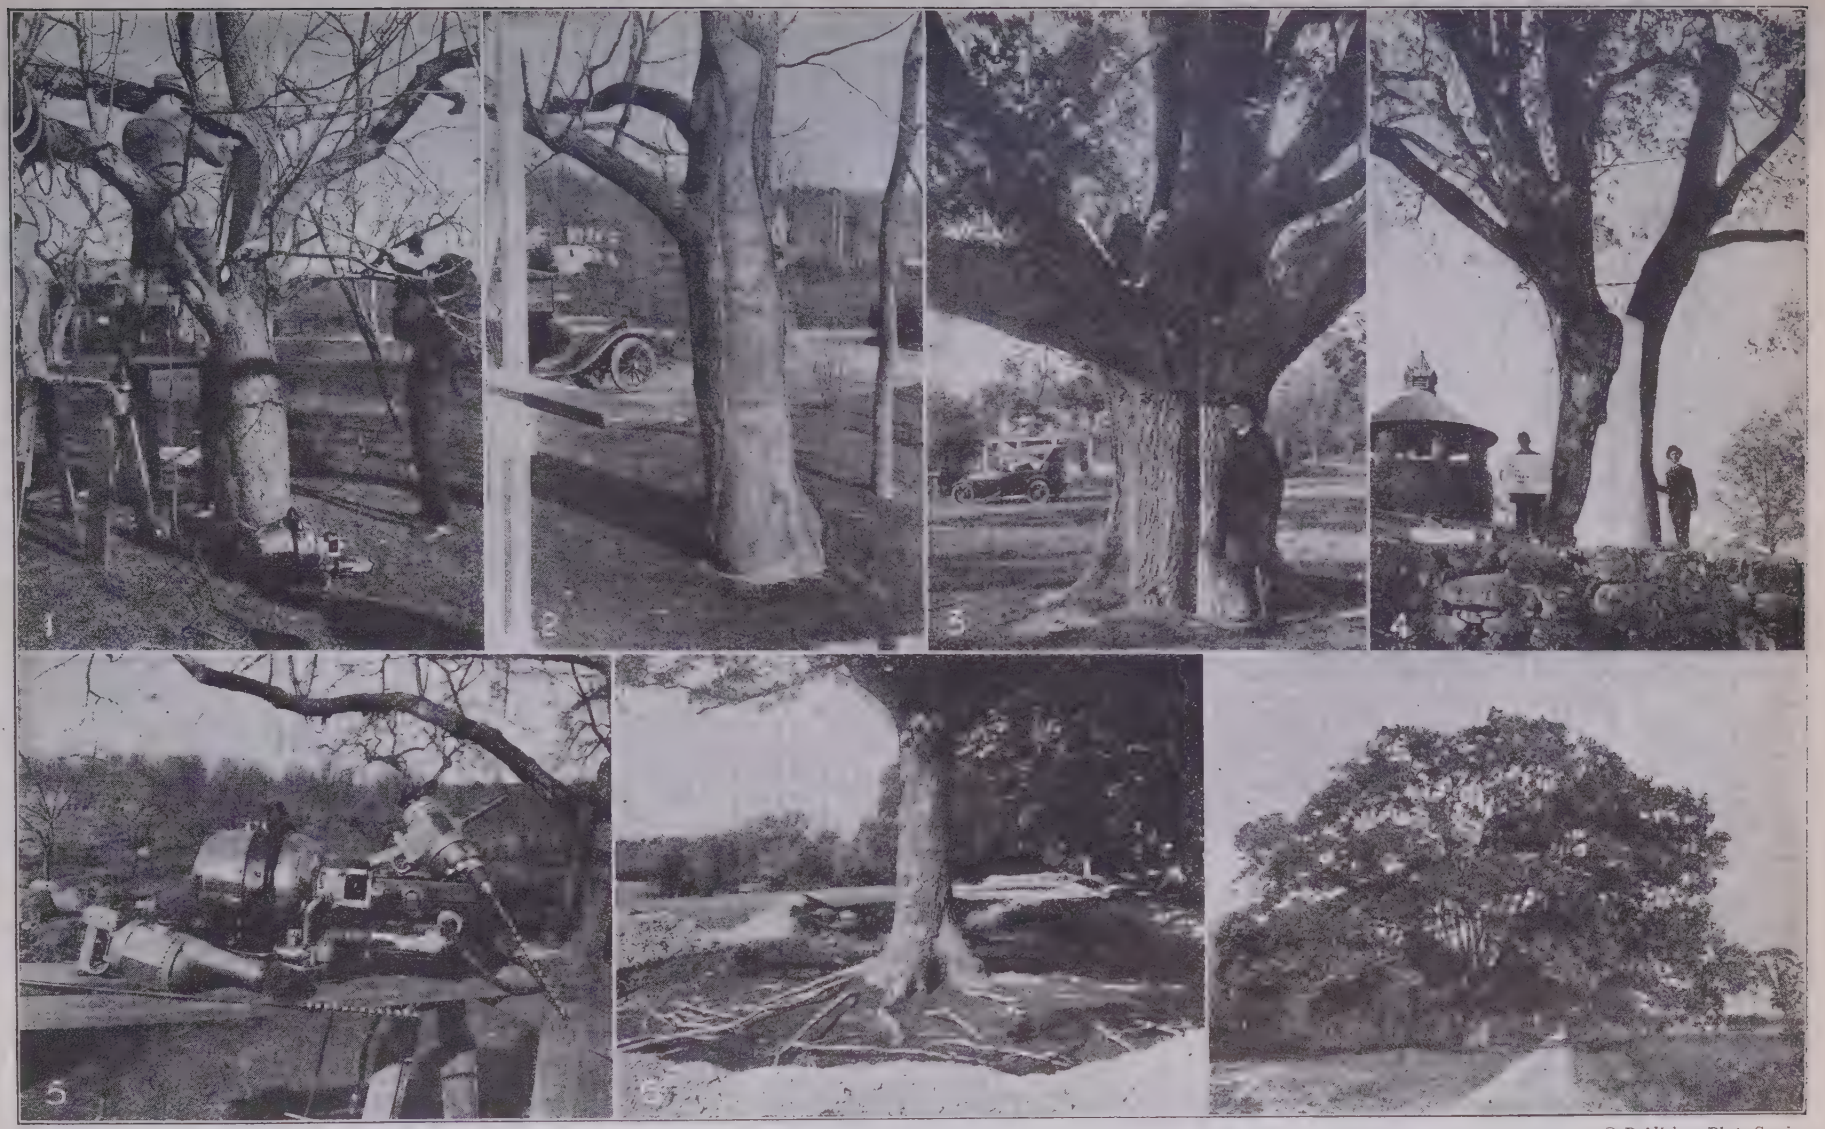
Charter Oak, The. A tree celebrated in American (legendary) history. It formerly stood in Hartford, Conn., and according to tradition, when Governor Andros came to Hartford in 1687 to demand of the Assembly the surrender of the colonial charter, the debate in that body over the governor's demand was prolonged beyond daylight, when suddenly the lights were extinguished, and in the darkness a patriot, Captain Wadsworth, escaped with the charter and hid it in a hollow oak. There is, however, no contemporary record of this event. The Charter Oak was overthrown by a storm in 1856.

Elm, Old Liberty. A famous tree on Boston Common, which stood near the "long walk," at the foot of Flagstaff Hill. It was a tree of unknown age, believed to have stood before the settlement of the town in 1630 and already decrepit as long ago as 1755. It was over seventy-two feet high, and measured twenty-two and a half feet in circumference one foot above the ground. After resisting many a storm, it was blown down in the winter of 1876. An iron fence surrounds the spot where it stood.

Fairlop Oak. A giant oak in Hainault Forest, Essex, England, whose girth was forty-eight feet, and beneath whose widely spreading branches an annual fair was held on the first Friday in July. The tree was blown down in February, 1820.

Judas Tree. A corruption of Kuamos tree, the leguminous or bean tree. The corrupt name has given rise to the tradition that it was upon one of these trees that Judas Iscariot hanged himself.

Mather's Willow. The weeping-willow over the grave of Cotton Mather in Cop's burying-ground, near Bunker Hill, taken from a tree that shaded the grave of Napoleon at St. Helena.



Mt. Vernon Ashes. The immense ash trees planted by General Washington at Mount Vernon, and now the admiration of visitors.

Old Moses. One of the largest trees in the world is that discovered, in 1874, in a grove near Tule River, in California. Though the top has broken off, it is 240 feet high, and the diameter of the tree where it has been broken is twelve feet. This giant of the forest is called Old Moses from a mountain in the neighborhood, and is calculated to be over 4,850 years old. The hollow of its trunk, which is 111 feet, will hold 150 persons. It is hung with scenes of California, carpeted and fitted up like a drawing room, with table, chairs, sofa and piano.

General Sherman Tree. This is the largest of the sequoias, 273.9 feet high, 37.3 feet in diameter at the base, and 18.7 feet in diameter 100 feet from the ground. It stands in the Sequoia National Park.

Washington Elm, The. The noted elm under which George Washington took command of the Continental army, in Cambridge, Mass. While being trimmed by workmen, this tree fell, October 26, 1923. On its site now stands a small granite slab with the inscription in bronze letters: HERE STOOD THE WASHINGTON ELM UNDER WHICH WASHINGTON TOOK COMMAND OF THE AMERICAN ARMY, JULY 3, 1775.

An offshoot of the famous elm was presented, as a gift from the University of Washington, and planted on Cambridge common in the spring of 1931. The shoot from the parent tree had grown, from the time of its planting in 1896, to a height of forty feet.

TREES AND THEIR CARE

Modern care of trees includes scientific methods in both the planting and care of the growing tree. As these pictures show, many trees that would otherwise die are saved by scientific treatment. A number of the great historic trees have received similar care and have thus been preserved to contribute to the enjoyment of generations to come.

1. Drilling out the decayed matter from the tree. 2. A concrete trunk, over which the bark will gradually close in the course of years. 3. The bark has closed over the concrete. 4. Concrete trunk of a tree that is seventeen feet in circumference. 5. Drill used in cutting out decayed matter from the inside of trees. Note the burring tool on the end of the machine. 6. Treating the roots of the tree. A tree requires proper nourishment. It also needs the earth about its roots kept loose enough to permit some air to filter through, and thus prevent the earth from growing sour. 7. A beautiful tree that was saved by scientific care.

TUNNELS, FAMOUS

Men build tunnels for many purposes: as passageways for pedestrians and vehicles, to carry water (aqueducts), sewage or gas, for pneumatic tubes, pipes and cables. Ancient peoples cut their tunnels through the rock with crude hand tools; modern man blasts his way through with explosives. Mine tunnels were excavated centuries before the Christian era. The earliest ones probably were made for religious purposes. The famous catacombs at Rome were great tunnels under the city's streets in which the early Christians sought safety, and where they held services and buried their dead. Lords of medieval castles had tunnels constructed from their underground vaults that they might escape when the enemy pressed them too hard. Today tunnels are constructed under rivers and cities and through mountains to provide greater and faster transportation facilities. The following list of tunnels includes those famous in history and noted as engineering feats.

Arlberg, a railroad tunnel under the Alps at the Arl Mountains, extending from Langen to St. Anton, 6¾ miles long, was opened in 1884 and cost $7,500,000.

Arthur's Pass, a railroad tunnel in South Island, N. Z., has a total length of 5.38 miles. Completed in 1912, the approximate cost was $3,000,000.

Baltimore Tunnels. The Baltimore and Ohio railroad was the first to make use of electric motive power on the railroads in this country, in 1895 at Baltimore, Md. The main line of this railroad passes under the city through tunnels which were completed in 1894. The main tunnel under Howard Street is over 7,000 ft. long. Through the quicksand areas, the adjacent ground was solidified by forcing large quantities of thin cement into it. Power was supplied from overhead wires until a third-rail system was installed in 1902. The electrified section totals about seven miles in length.

The Pennsylvania Railroad has two tunnels in Baltimore. The Union Tunnel, lying north of Union Station was built by the Union Railroad Company of Baltimore in 1871 under the bed of Hoffman Street from Bond Street to Greenmount Avenue. Baltimore Potomac Tunnels lying south of Union Station were built by the Baltimore and Potomac Railroad Company in 1873. Tunnels under Wilson Street from North Avenue to Pennsylvania Avenue and under Winchester Street, Fremont Avenue to Gilmore Avenue, total 7,150 ft. in length.

Belmont tunnel of the Interborough Rapid Transit Co., New York City, lies under the East River from Forty-second Street, New York to Long Island City. The portion under water consists of two single-track tubes with cast-iron rings 16 ft. 10 in. outside diameter, and a clear inside diameter of 15 ft. 6 in. Construction was completed on January 1, 1908. Train operation was begun on June 22, 1915.

Big Bend tunnel drains the Feather River in California. It is two miles long, and was opened in 1886.

Bitter Root Mountains. This tunnel, lying in Montana and Idaho is 10,100 ft. long.

Blackwell, a tunnel under the River Thames in England, a mile and a half in length, was opened in 1897.

Brooklyn-Manhattan Transit Corporation tunnel in New York City extends from Whitehall Street, Manhattan to Montague Street, Brooklyn. The length between bulkhead lines is 3,900 ft., and the inside minimum diameter is 15 ft. The outside minimum diameter is 17 ft. 2 in. Work was begun July, 1914 and the tunnel was opened on August 1, 1920.

Busk-Ivanhoe tunnel, a single-track bore, 9,600 ft. long, used by the Colorado Midland R.R., lies under the Continental Divide in Lake and Pitkin Counties, Colorado.

Caldera, a railroad tunnel in Peru, S.A., 1¾ miles long, was built in 1893.

Cascade Mountain, a tunnel running through the Cascade Mountains in Washington, 8 miles in length, was opened in 1928.

Catskill Aqueduct, covering 92 miles to New York City, and 35 miles of distributing tunnels deep under the city itself, was completely opened in 1917. The Shandaken tunnel, a part of the Catskill water supply system, is used to deliver the water of Schoharie Creek to the Ashokan Reservoir. It is 18.1 miles long, the longest tunnel in the world. It is concrete-lined, 10½ ft. wide and 11½ ft. high, with a capacity of 600,000,000 gallons a day; it was opened early in 1924.

Clark Street Tube of the Interborough Rapid Transit Co., New York City, consists of twin tubes lying underneath the East River, connecting the Interborough Seventh Avenue Subway in Manhattan with the Fulton Street-Flatbush Avenue Subway of the Interborough in Brooklyn. They were completed and put in operation in 1919. They are 5,047 ft. long, with an outside diameter of 17 ft. 6 in. and inside diameter 15 ft.

Col Des Montets, a tunnel on the narrow-gauge electric railway from Fayet, France, to the Swiss frontier, about 1½ miles in length, was opened in 1918.

Connaught, a double track railroad tunnel running through the Selkirk Mountains, lies under Rogers Pass, British Columbia. Five miles long, its approximate cost was $6,500,000. Operations were completed in 1916.

Croton Aqueduct, carrying water 33½ miles to New York City, was opened in 1888.

Cumberland, a tunnel lying under the Cumberland Mountains in Tennessee, is 8,000 ft. long.

Detroit-Canada. A railroad tunnel under the Detroit River from Detroit, Mich., to Windsor, Ont., is 1.6 miles in length and was opened in 1910. Cost $10,000,000.

Detroit-Canada. A vehicular tunnel, with a capacity of 1,000 automobiles an hour in each direction, was opened between Detroit and Windsor in November, 1930. This tunnel, excepting the Holland tunnel in New York which connects New York with New Jersey, was the largest built, at the time of its opening. It is 5,135 ft. long, which is approximately a mile, the river section being 2,200 ft. with a 22 ft. roadway. A trench was dug and nine steel tubes floated and sunk into place to make the part under the river. An 18 in. concrete lining was then added. Customs and immigration inspectors have been assigned to work at each entrance of the tunnel.

Elizabeth Lake, Los Angeles, aqueduct was built between 1907-1911. It is 5.1 miles long and cost approximately $1,088,000.

Erie Railroad or **Bergen** tunnel, through Bergen Hill, Jersey City, was constructed between 1856 and 1861. Originally it was 4,385 ft. long, but was shortened at both ends when the Bergen Archways was constructed. The total length is now 4,162 ft. It is a two-track tunnel 28 ft. wide, center arch 21 ft. high. It has been used for freight traffic only since the construction of the Bergen Archways in 1910.

Florence Lake, an aqueduct in southern California, 12.8 miles in length, was finished in 1925 and cost $17,000,000.

Fourteenth Street, East, a tunnel in New York City from Manhattan to Williamsburg, used by the Brooklyn-Manhattan Transit Corporation. The length between bulkheads is 3,050 ft., minimum diameter inside 15 ft. and maximum diameter outside 18 ft. Begun in February, 1916, it was opened June 30, 1924.

Gallitzin tunnel, a 3,600 ft. bore extending through the Allegheny Mountains at Gallitzin, 11 miles west of Altoona, Pa., was built in 1854, for two tracks of the Pennsylvania Railroad. In 1904 a new single track tunnel was built parallel with the old tunnel, through which is operated one westbound track, another westbound track being operated through the old tunnel, replacing the original two tracks in order to give added clearance. The two eastbound tracks through the mountain lie within New Portage tunnel, 1,610 ft. long, built in 1855.

Gravehals, a railroad tunnel extending between Oslo and Bergen, Norway, 3.3 miles long was built between 1904-1909.

Grenchenberg, a railroad tunnel in the Jura Mountains, Switzerland, 5.3 miles in length, was completed in 1915 at the approximate cost of $3,500,000.

Gunnison, an aqueduct in Montrose, Colo., six miles long, was built between 1905 and 1909 at the approximate cost of $2,170,000.

Harlem River tunnel, in New York City, connecting Lenox Avenue between 142nd and 143rd Sts., Manhattan, with 149th St. There are two single cast-iron tubes 15 ft. inside diameter with a center diaphragm. The tubes are 641 ft. long. Work was begun in 1901 and completed in 1905.

Harlem River tunnel, Lexington Avenue Line, passes under the Harlem River north of 131st St. It consists of four single track steel tubes connected in center with diaphragm and concrete reinforcement. The inside diameter is 16 ft. 6 in. and the length of the tube is 1,080 ft. Begun in 1913; put in operation in 1918.

Hetch Hetchy, an aqueduct in San Francisco, 18 miles in length was built between 1920 and 1923.

Holland Vehicular Tunnel includes twin tubes under the Hudson (North) River, 9,250 ft. in length, extending from Canal Street, Manhattan, to Twelfth Street, Jersey City. Opened to commercial traffic November 13, 1927. Each tube is 29 ft. 6 in. external diameter, with interior roadway width of 20 ft. and clearance height of 13 ft. 6 in. The tunnel was built to accommodate 46,000 vehicles a day. On the first day it handled over 52,000. There are narrow sidewalks for the tube police. The total traffic for 1928 was 8,744,674 vehicles, and the maximum day in that year totaled 48,004 vehicles. On May 12, 1929, the tunnel was used by 52,178 vehicles.

Hoosac, a railroad tunnel running through the Hoosac Mountains, Mass. is 4.75 miles in length and was built between 1856 and 1873 at the approximate cost of $11,000,000.

Hudson and Manhattan Railroad north tunnels lie under the Hudson River from Jersey City to Morton St., New York. There are two single track tubes, with a minimum inside diameter of 15 ft. 3 in. The length is approximately 5,700 ft. Up-town tunnels connect with north tunnels at Morton St. and extend to 33rd St. Operations were started in March, 1904, and completed in 1910. Two single track tubes extend from the Hoboken terminal of the Lackawanna Railroad to Jersey City, with connections to the north tunnels and to the Erie Railroad Station. At Washington St. a branch runs to the Pennsylvania Railroad Station at Jersey City. Here connections are made with the south tunnels. West from Washington St., Jersey City, to a point east of Waldo Ave. is a double-track concrete subway with a center wall dividing the two tracks. West from this latter point the tracks rise to the surface and extend to Journal Square Station, Jersey City, where connection is made with the tracks of the Pennsylvania Railroad, which extend to Manhattan Transfer, Newark. Work was completed in 1911.

Interborough Rapid Transit tunnel, the first of its tubes under the East River from the Battery, New York, to Joralemon St., Brooklyn, connecting the New York and Brooklyn subways, was begun in 1903 and was in operation in 1908. There are two tubes 6,784 ft. long, with an inside diameter of 15 ft. 6 in.

Jungfrau, a railroad tunnel in the Swiss Alps, 4.47 miles in length, was built between 1897 and 1912 at a cost of $1,375,000.

Khojak Pass, a railroad tunnel extending from Quetta to Landabar, India, 2.44 miles in length, was opened in 1891.

Lackawanna Railroad, a tunnel through Bergen Hill, Jersey City, was started in 1906 and completed in 1909. It is 24 ft. from the old tunnel and of the same length, 4,283 ft. The new tunnel is double tracked, lined with concrete. Its inside dimensions are 23 ft. high and 30 ft. wide.

Lausanne, an aqueduct, 3.8 miles long, drains mines in Mauch Chunk, Pa. Completed in 1912 at an approximate cost of $380,000.

Loetschberg, a railroad tunnel running through the Alps in Oberland, Switzerland, 9½ miles long, was opened in 1913, its cost approximating $10,000,000.

Moffat, a tunnel piercing the Rocky Mountains at the Continental Divide, in Grand and Gilpin Counties, Colorado. It is on the line of the Denver and Salt Lake Railway, with its eastern portal 50 miles west of Denver; and it shortens by 23 miles the traveling distance between those cities. The bore, 39,560 ft. long, begun in 1923 and holed through on February 18, 1927, was opened in February, 1928. The tracks at the eastern end, near Tolland, are 9,198 ft. above sea level, and 9,085 ft. at the western opening, near Irving. The dimensions of the main tunnel are 24 ft. high by 16 ft. wide. A pioneer tunnel, 8 ft. square, was first built, and through cross cuts to this the refuse from the larger tunnel was removed. When the big tunnel was completed the cross cuts were closed and the smaller bore used as an aqueduct. The large bore carries a single track, laid with 110 pound rails on treated oak ties with rock ballast. The project was started by David H. Moffat, railway builder, who died in 1911.

Mont Cenis, a railroad tunnel running from France to Italy under the Col de Frejus, practically 8 miles long, was opened in 1871. The approximate cost was $15,000,000. The line is electrified between Modane and Culoz.

Mont d'Or, a railroad tunnel through the Jura Mts. between France and Switzerland, from Fresne to Vallorbe is 3.3 miles in length and was completed in 1915. It cost approximately $4,060,000.

Mt. Roberts tunnel extends from Gastineau Channel at Juneau, Alaska, into Silver Bow Basin, and is 1½ miles in length.

Mt. Royal, a railroad tunnel in Montreal, Canada, 3.22 miles long was begun in 1910 and completed six years later.

Newhouse, a tunnel for drainage and transportation in Idaho Springs, Colo., 4.17 miles long, was completed in 1910.

New York Central Railroad, Park Avenue Tunnel, was completed in 1837. It was two-track and only extended to 96th St. The railroad at that time terminated in the vicinity of City Hall. In 1872, the railroad was four-tracked, the four tracks being covered over from 56th St. north to the old tunnel at 96th St. There was a two-track tunnel in the center and a single track tunnel on either side. The length of the tunnel was approximately 10,000 ft.

Susquehanna and Western Railroad tunnel through the Palisades at Edgewater, New Jersey, constructed during the years 1892 to 1894, is a two-track tunnel partly brick-lined, 27 ft. wide and 21 ft. high to the inside of a semi-elliptical arch. Its length is 5,058 ft. and is used for freight traffic only.

Nice-Cuneo tunnel, under the Alps, was opened for rail traffic in 1928. There are two tunnels: one of 5,939 meters, at the Col de Braus; one of 3,883 meters under Mont Grazian. The entire route is 76½ miles in length.

Pennsylvania Railroad tunnels under the Hudson River extend from the Pennsylvania Railroad Station, New York, to Weehawken, N. J. There is no station at Weehawken; the electric trains from the Pennsylvania Station express to Manhattan Transfer, near Newark, N. J. Work was started in 1904 and completed in 1910. There are two tubes of cast-iron rings, comprising a 23 ft. outside diameter and 21 ft. 2 in. inside diameter. The portion under the river is 6,118 ft. long. The Hudson tubes were opened on November 27, 1910, when the road between Long Island City and Manhattan Transfer was electrified. Electrification has been in progress since 1903.

Manhattan crosstown tunnels from the Pennsylvania Railroad Station, cross New York at 32nd and 33rd Sts. to First Ave. Work was started in 1905 and completed in 1910. There are two two-track tunnels, built of concrete with the crown about 60 ft. below the surface of the street.

East River tunnels connecting the crosstown tunnels extend under the East River to Long Island City. These were started in 1904 and completed in 1910. There are four separate tubes with rings 23 ft. outside

diameter and each tube from the Manhattan shaft to the Long Island City shaft is 3,900 ft. long. The tunnels under Manhattan and the East River were opened to Long Island traffic in 1910.

Otira, a tunnel in New Zealand, is 5½ miles long.

Pirahy River, an aqueduct in Rio de Janeiro, Brazil, 5.25 miles in length, was constructed during the years 1911 to 1913.

Ricken, a tunnel in the Swiss Alps, 5.35 miles in length was completed in 1910, at an approximate cost of $2,500,000.

Roosevelt aqueduct drains mines in Cripple Creek, Colo., is 2.98 miles long; cost $428,000, and was opened in 1910.

Rothschönberg, a mine drainage tunnel in Freiberg, Sax., 18 miles in length was built between 1844 and 1887.

Rove tunnel is the southern section of the Marseille-Rhone canal in France. This piece of engineering is said to be the largest accomplished since the building of the Panama Canal. It was formally opened in April, 1927, by the President of the Republic. The underground canal, passing through a rocky ridge for a distance of 4½ miles, cost about 135,000,000 francs. Its greatest width is 72½ ft., and the width of the water channel is 60 ft. The roof is 37½ ft. above the water. Two 1,500-ton barges can pass without difficulty. This is only part of the 50-mile canal which is eventually to join the river Rhone, at Arles, to Marseille.

Samport, a tunnel in the Pyrenees Mountains, 4 miles long, extending from Pau, France, to Canfranc, Spain, was opened in 1928.

Sasago, a railroad tunnel extending from Tokio to Kofu, Japan, completed in 1902, is 2.9 miles in length.

Severn, a tunnel extending from Monmouthshire to Gloucestershire, England, 4½ miles long was opened in 1886.

Shandaken, an aqueduct between Gilboa and Allaben, New York, is 18 miles long. It was built between 1919 and 1923 at an approximate cost of $12,138,000.

Simplon, a railroad tunnel running through the Alps between Switzerland and Italy is 12½ miles long. It was built between 1898 and 1905, at a cost of $21,000,000. A twin tunnel was opened in 1921; both are electrified.

Sixtieth Street tunnel of the Brooklyn-Manhattan Transit Corporation in New York City, extends from Manhattan to Long Island City. The length between the bulkheads is 2,580 ft. with a minimum diameter inside of 15 ft. and maximum diameter outside of 18 ft. Begun in 1916, the tunnel was opened in 1920.

Snoqualmie, a railroad tunnel in the Cascade Mountains, Wash., 2.25 miles in length, was completed in 1915, and cost $2,000,000.

Southern Pacific and Central Pacific Railroad tunnels, Chatsworth Park, through Coast Range Mountains, in Los Angeles County, Cal., 1.4 miles; San Fernando, through Spur, 1.32 miles.

Spiral. The tunnels on the Canadian Pacific Railway, between Hector and Field, B.C. consist of two spiral tubes, the westerly, 3,255 ft. long, under Cathedral Mountain; and the easterly, 2,921 ft. long, under Mt. Ogden, with the Kicking Horse River between.

Stampede, a railroad tunnel in the Cascade Mountains, Wash., 1.83 miles long, was completed in 1888.

Strawberry, a tunnel running through the Wasatch Mountains.

St. Clair, a tunnel under the St. Clair River running from Sarnia, Ont., to Port Huron, Mich., 2 miles long, was opened in 1891.

St. Gothard, a tunnel running through the Alps, connecting Goschenen with Airolo, in Switzerland is 9½ miles long. It was opened in 1881, cost approximately $11,500,000, and has since been electrified.

St. Mary's tunnel, New York City, has two straight tracks on a level grade passing through the tunnel under St. Mary's Park, the Bronx. The tunnel was built in 1904 and extended from 149th St. to Jackson Ave., covering about 1,800 ft. Two types of construction were used. A flat roof composed of I-beams and concrete, resting on concrete walls and an arched roof tunnel of concrete. For the flat roof type, the dimensions were 26 ft. wide and 16 ft. high and for the arched roof type, the dimensions were 26 ft. wide and a center height of 21 ft.

Sutro, a mine drain tunnel for the Comstock Lode in Nevada, 4½ miles long, was opened in 1879.

Tauern, a railroad tunnel in the Austrian Alps, 5.31 miles in length, was completed in 1909 at an approximate cost of $6,063,000.

Tequixquiac, an aqueduct draining the City of Mexico, 6.25 miles long. It took 18 years to build, was finished in 1898, and cost $6,760,000.

Totley, a tunnel in England, is 3¾ miles long.

Trans-Andine Railway tunnel, extending from Chile to Argentina, 5 miles long and 10,512 ft. above sea level, affords direct communication between Valparaiso and Buenos Aires. It was opened in 1910.

Wasserfluh, a tunnel in the Alps between Bunnadern and Lichtensteig in Switzerland, 2 miles in length, was opened in 1909.

West Shore Railroad tunnel was built at Weehawken, N. J., and completed in 1883 at a cost of $525,000. It is double-tracked. A steel and concrete portal constructed in 1907 at the east increased its length to 4,273 ft. The normal section is 27 ft. wide and 19 ft. high. 80.500 cubic yards of rock were removed, and five vertical shafts were utilized. The tunnel is a tangent, with the exception of the extended portion of the east end at which point the freight and passenger tracks divide.

Woodhead, a vehicular tunnel extends 2.2 miles under the River Mersey between Liverpool and Birkenhead, England.

TUTENKHAMON

Lord Carnarvon of England, and Howard Carter, an American archaeologist, after excavating for seven years in the Valley of the Kings near Luxor, Egypt, in 1922 discovered in surprisingly perfect condition the tomb of Tutenkhamon, an Egyptian ruler of the fourteenth century B.C. The tomb contained splendid paintings of this era, golden shrines, vases, chariots, caskets and furniture inlaid with jewels and gold. In the coffin was found a solid gold model of the mummified ruler's face. This ancient tomb remained in perfect condition due to the fact that in excavating the tombs above, this one was buried in the debris, thus being protected both from the air and from thieves. The great variety of objects discovered makes it possible to get a true picture of Egyptian art and customs of 2,400 years ago.

TYPEWRITER

For centuries men tried to find a machine that would do their writing for them. Henry Mill secured a patent for a writing machine in 1714, and W. A. Burt took out an American patent for a cumbersome machine in 1829. Other attempts were made but none of the machines were practical. Then Christopher L. Scholes of Milwaukee built a machine on which he wrote to his friends and in which he gradually interested a number of men. A Pennsylvanian, James Densmore, helped finance the machine and also made constructive suggestions that helped Scholes better his typewriter until he interested a firm of gunmakers, Remington and Sons, and they manufactured the machine. The first ones went on the market in 1874.

There are two chief varieties of typewriter, the shuttle and the type-bar machines. The Hammond is a shuttle machine. Here the letters and marks used are on a curved plate, sometimes called a "shuttle." By depressing the key the letter on the shuttle is brought into position and the paper forced against it. It is possible to change these shuttles and thus use different styles of type and alphabets. The Blickensderfer typewriter placed the characters on a wheel striking the paper on a rubber cylinder, turning to bring the characters into place.

The first type-bar machine was the Remington. This has the letters on the ends of steel bars, forty-two in number, arranged in a horizontal semicircle. By depressing a key the arm rises quickly to a common center, thus printing the letter on the paper which lies on a rubber cylinder. This cylinder is mounted upon a machine which moves from right to left one space after each letter is printed, or the space bar pressed. The operator pushes this cylinder back to the right at the end of each line, automatically lifting the paper one line. Between the type-bar and the paper an inked ribbon furnishes the ink. In standard typewriters the keys are arranged in a convenient order and this system is called the "universal" keyboard.

The modern typewriter strikes the common center on the front of the cylinder so that the writing is visible. Each type-bar operates two or more characters, capitals and small letters, numerals and punctuation marks. These are controlled by shift keys. When several sheets of paper are inserted with carbon paper between them many copies can be made at the same time. From sixty to one hundred words a minute are written by a practiced typist which is from three to five times as fast as handwriting will do the work.

The typewriter has created a vast field in the business world for a great number of women employees. The most popular system of operating a typewriter is the touch system whereby the desired keys are hit without looking at the keyboard. Special typewriters are now made for bookkeeping, and tabulating attachments can be fastened to the ordinary machine. The first typewriters used italic letters in imitation of longhand, but the modern machine usually has roman type. Fancy type faces and type faces for many foreign languages are also obtainable.

UNCLE SAM

The practice of calling the United States Government "Uncle Sam" is believed to have originated in the following manner: During the American Revolution a man named Samuel Wilson was a beef inspector at Troy, N. Y., and was very popular with the men in his employ, who always called him Uncle Sam. After the inspection of the beef, it was shipped to a contractor named Ebenezer Anderson, and was always marked "E. A. U. S." A joking workman, being asked what those letters were the abbreviations of, replied that he did not know, unless they were for Ebenezer Anderson and "Uncle Sam." The joke was kept up and spread, until it became common to refer to all packages marked "U. S." as belonging to "Uncle Sam."

UNDER THE ROSE

The Latin *sub rosa*, literally translated is "under the rose." It means that a thing is done or said secretly, because the rose was, among the Egyptians, the emblem of Harpocrates, the god of silence. At certain entertainments, the ancients were accustomed to hang up a rose in token that nothing said was to be divulged.

UNION JACK

The origin of the term Union Jack has never been precisely ascertained. It may be an extension of its nautical use signifying a small flag or similar ensign used as a signal and also on bowsprits of men-of-war, the flag being flown from the main mast by an admiral of the fleet. It would appear, however, that the word "union" arose from the union of the three kingdoms into one great political power. As an alteration in the banner of St. George occurred in the reign of James I, it may have been a rendering of the word "Jacobus," the Latin form of James, abbreviated into Jack.

UNIVERSAL LANGUAGES

Need for a means of international communication has been felt since men began to travel from country to country. Few people

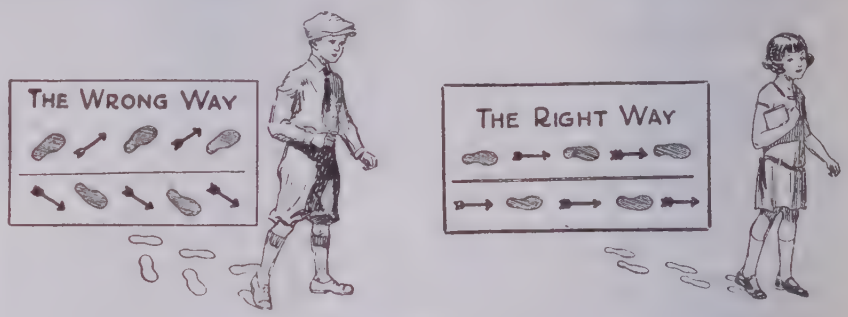
can speak more than three or four languages correctly and fluently. The ability to exceed this number is found only in those gifted with exceptional linguistic talent. As travel becomes more common, and as the telegraph, telephone and radio develop, it is by many considered increasingly desirable that people of all nations should have a common tongue. Because of national prominence, certain languages have at different times been almost universal among civilized peoples. In ancient times the Phoenician language served as a means of intercommunication among the traders of the Mediterranean, while in the Middle Ages, Latin was commonly known throughout Europe. Likewise, Greek, French and English have at times seemed the solution to finding a common language.

As the need for an international tongue grew, a great variety of languages were proposed in the seventeenth and eighteenth centuries. French, the languages of diplomats, and still the common tongue of society and diplomacy, was the favorite for international use. But gradually people came to see that no living language was likely to be adopted as a universal tongue because any choice brought forth international jealousy.

Bolak, Volapük. They therefore began to plan languages manufactured for the purpose of universal use. Bolak seemed hopeful for a time. Volapük, based mainly on English, with the rest of the vocabulary taken from Latin and the Romance languages, was published in 1880. It had an immediate vogue. Several Volapük congresses were held and the students of the language numbered more than 1,000,000. But the founder refused to accept suggested modifications, the language was found unsatisfactory, and after 1890 it fell into disuse.

Esperanto. Dr. Zamenhof published his new language, Esperanto, in 1887. Using as roots a large number of words from various European tongues, especially roots that were common to a number of them, he added various prefixes and suffixes to form the different parts of speech. He used more German roots than did Volapük, but few Russian ones. The language is pronounced as it is spelled and is more easily learned than any natural tongue. Esperanto attained wide use, although hampered by the fact that it used certain marks not commonly found in printers' fonts.

Idiom Neutral. Some of those interested in changes in Volapük constructed another language, Idiom Neutral, published in 1902. Based on words common to European languages, many having roots appearing in seven or eight languages, and nearly all appearing in three or four languages, Idiom Neutral is easily learned by anyone who is at all a linguist.



Ido. First published in 1908, Ido takes the good features from both Esperanto and Idiom Neutral.

The most successful of these proposed international languages thus far has been Esperanto, although Idiom Neutral is considered easiest to learn because its construction is simple and the roots used are the commonest in general use.

Ro is a language based on the analysis and classification of ideas instead of on existing word roots. It was devised, about 1906, by Rev. Edward P. Foster, an American.

VISION, LIMITS OF

The distance one can see varies with elevation, conditions of the atmosphere, intensity of illumination, and other modifying elements. On a clear day an object one foot above a level plain may be seen at a distance of 1.31 miles; one ten feet high, 4.15 miles; one twenty feet high, 5.86 miles; one 100 feet high, 13.1 miles; one a mile high, as the top of a mountain, 95.23 miles. This allows seven inches; or, to be exact, 6.99 inches, for the curvature of the earth, and assumes that the size and lighting of the object are great enough to produce an image.

How to Walk

Children should learn to walk the right way, with toes pointing straight ahead. (From *The Growing Child*, by Dr. Herman N. Bundesen, Chicago, 1927.)

WALKING, RIGHT WAY OF

The Indian, walking and running for hours without fatigue, points his toes slightly inward. The runner or jumper and the person who has never worn shoes all walk with toes pointed straight ahead, or else slightly inward. The old rule of "toe out" did much damage to children's feet, and was one of the causes of flat foot, or fallen arch that causes pain in the calf of the leg and makes a person tire easily. It is impossible to have free knee action when toes are turned outward and a clumsy gait is the result. Graceful, easy walking and running can be accomplished only by persons who point the foot straight ahead or slightly inward.

WATCHES OF THE NIGHT

The Jews, like the Greeks and Romans, says the Rev. Dr. William Smith in his *Bible Dictionary*, divided the night into watches instead of hours, each watch representing the period for which sentinels or pickets remained on duty. The proper Jewish reckoning recognized only three such periods, entitled the first or "beginning of the watches" (Lamentations ii, 19), the middle span (Judges vii, 19), and the morning watch (Exodus xiv, 24; I Samuel xi, 11). These would last, respectively, from sunset to 10 P. M., from 10 P. M. to 2 A. M., and from 2 A. M. to sunrise. After the establishment of the Roman supremacy the number of the watches was increased to four, which were described either according to their numerical order, as in the case of the "fourth watch" (Matthew xiv, 25), or by the terms "even," "midnight," "cockcrowing," and "morning" (Mark xiii, 35). These ended, respectively, at 9 P. M., midnight, 3 A. M., and 6 A. M.

WATER

Water is a clear, colorless, transparent liquid which has neither taste nor smell. All these qualities may come from mineral or vegetable matter in the water or, in case of color, from reflections, but the water itself possesses none of them. It is one of the most important and most widely-distributed substances in nature, occurring universally in one or other of its three physical states—liquid, solid, or gaseous. As a liquid it constitutes the great mass of the oceans, rivers, and lakes, which cover nearly three-fourths of the earth's surface; in the solid state it exists in the form of ice or snow, and as a vapor is a constituent of the aerial envelope of the earth, and the exhalations of volcanoes and boiling springs. In the course of many years water broke down rock and formed the soil. It equalizes the temperature and keeps the earth sweet and clean. Without it there could be no life on earth. It occurs in combination in many mineral substances, and also in organic bodies. Animals and plants contain from 80 to 95 per cent of water. It is the most efficient of all solvents, there being few substances which are not, to some extent, affected by it, hence natural waters never occur absolutely pure, but contain in solution more or less of the constituents of the strata through which they have passed.

Rain Water contains substances derived in minute quantities from the atmosphere, such as ammonia, nitrate of ammonia, carbonic acid, nitrous and sulphurous acids.

Spring Water always contains a much larger proportion of dissolved substances than rainwater. When highly charged with saline or gaseous constituents it has a peculiar taste or smell, and is called mineral water. When the amount of these constituents does not sensibly affect its taste, it is described as fresh water.

Sea Water is essentially a mineral water, its saline constituents consisting of the chlorides and sulphates of sodium, potassium, magnesium, and calcium, together with minute quantities of silica, bromine, iodine, phosphoric acid, and other minerals. The total solid contents of sea water in mid-ocean varies from 30 to 40 gm. per liter, being largest near the equator and smallest near the poles.

A cubic inch of fresh water at 42 degrees weighs .036126 lbs. A cubic foot weighs 62.321 lbs. A cubic foot contains 6.2321 gallons. A gallon weighs 8.3389 lbs. A

ton comprises 35.943 cu. ft. Salt water is slightly heavier than fresh.

Water was long regarded as an element, but toward the end of the seventeenth century it was shown by Lavoisier to be a compound, and to consist of two parts by weight of hydrogen to sixteen of oxygen, or two volumes of hydrogen to one of oxygen. When pure it is free from taste and smell, and at ordinary pressure is liquid between 0 degrees, and 100 degrees Centigrade, boils at 100 degrees, and freezes at 0 degrees, expanding to the extent of one-eleventh of its volume. The quantity of heat absorbed in the melting of ice is sufficient to raise the temperature of an equal weight of water 79.2 degrees; the quantity of heat rendered latent by water at 100 degrees becoming vapor would raise the temperature of water 5.37 times as much as from 0 degrees to 100 degrees. Water is 825 times heavier than air, and when converted into steam expands to nearly 1,600 volumes. One cubic centimeter at four degrees, and under a pressure of 760 millimeters of mercury, weighs 15.432349 grains, or one gram, the unit of weight in the metric system.

Water in its gaseous form is a colorless, invisible gas, quite distinct from the visible cloud which issues from a kettle, which is composed of minute drops of water produced by the condensation of the steam as it issues into the colder air. Under ordinary atmospheric pressure, water boils in an open vessel at a temperature of 100 degrees, Centigrade, and the steam always has this temperature, no matter how fast the water is made to boil. The heat which is supplied simply suffices to do the work of converting the liquid water at 100 degrees into gaseous steam at 100 degrees, without raising the temperature of the steam at all. If the temperature of steam at 100 degrees is lowered by only a very small amount, part of the steam is condensed; hence steam at this temperature is termed moist or saturated steam. At high temperatures and pressures, steam behaves like a perfect gas; but at lower pressures and at temperatures near the boiling-point of water, its behavior differs markedly from that of perfect gases; and this change of properties has to be taken into account in all calculations connected with the expansion of steam in steam-engines.

It is estimated that about 200,000,000 horse power could be obtained from water. Switzerland, without coal supplies, but with many mountain streams, depends on water to run her factories. Canada uses about 30,000,000 horse power and the United States 55,000,000 from streams and waterfalls, and this is but a small propertion of available power.

WATERFALLS

Among the famous waterfalls of the world the Yosemite makes three leaps, 1,430 feet sheer, 800 feet over rocks, and a final drop of 320 feet, for a total of 2,550 feet. Among others having great fall are: Roraima, i Guiana, 2,000 feet; Ribbon Falls, Yosemite, California, 1,612 feet; Sutherland Falls, New Zealand, 1,904 feet; Takkakaw, in British Columbia, 1,200 feet; Gavarnie, Pyrenees, 1,385 feet.

Many of the best known falls possess outstanding beauty rather than great height. Montmorency Falls in Quebec, Victoria Falls in Africa, Multnomah in Oregon, Yellowstone in Wyoming, Iguassu in Brazil, Snoqualmie in Washington, and the Falls of the Rhine are among these. The Falls of Tequendama in Colombia are one of the natural wonders of South America. The Bogota River is 140 feet wide as it flows over a tableland. Then it is suddenly contracted into a narrow, deep forty-foot bed, whence its strangled waters bound 475 feet to an abyss below, the actual depth of which is unknown. This fall was a sacred place to the ancient Indian population, and here sacrifices were offered to their gods.

Niagara Falls. Probably the best known of waterfalls is Niagara. Due to the shape of the underlying rock, the great width of the falls and the volume of flow this waterfall is one of the most beautiful in the world. It is the outlet through which four inland seas flow toward the Atlantic Ocean. These Great Lakes of the St. Lawrence river system differ little in elevation. Superior, the first of the series, lies at 602 feet, and Erie, the last of these four, at 573 feet above sea level. But Ontario, the fifth, lies in a broad valley very far below the upper plain on which Lake Erie rests, the difference between the two bodies of water being 326 feet. The upland plain joins the low valley along a bold escarpment of 200 feet or more that extends east and west continuously through western New York, passing between the two lakes into Canadian territory.

The connecting stream between all of the lakes have rapids or river characters, but that connecting Erie and Ontario, because of their great difference of level and the presence of this escarpment, had developed a cataract and series of rapids that form one of the natural wonders of the world. The stream is Niagara River and the cataract Niagara Falls.

Niagara River is only about twenty-eight miles in length, and for about nineteen miles of that distance, from Buffalo to Niagara Falls, it flows as a broad, smooth stream with low drift banks, presenting no unusual characters. There the rapids begin, and for half a mile, in which distance the descent amounts to fifty feet, the waters become a boiling torrent. In this portion several islands appear, the largest, Goat Island, dividing the river into two unequal parts. Both plunge over the precipice to a narrow, deep gorge, which turns away almost at a right angle and with a succession of foaming rapids and whirlpools finally reaches the open, low valley at its bordering escapement seven miles below. One sharper turn than the others is known as the Great Whirlpool.

The separation by Goat Island makes two falls. The smaller lies to the American side and is known as the American Fall. It has a crest of 1,060 feet, a depth of less than 10 feet and a fall of 167 feet. Under the ledges which form the chief support the spray has succeeded in forming cavernous recesses, one of which is accessible and is known as the Cave of the Winds. The part between Goat Island and the Canadian shore is much the larger. It forms a great curve with a crest 3,010 feet long, known as the Canadian or Horseshoe Falls. The amount and depth of water pouring over this crest are much greater than at the American Fall, but its fall is somewhat less, 158 feet. A further descent of 104 feet is reached by the seven miles of rapids through the gorge.

The average flow of water over both falls is estimated by the United States engineers, from the mean flow of water over a period of 40 years from Lake Erie at Buffalo, to be 222,400 cubic feet per second. This volume of water has a potential value of probably more than 3,800,000 horse power. The American side shows a recession of half a foot per year; the Horseshoe Falls recedes two to four feet.

The falls were discovered in 1678 by Father Hennepin, whose description and estimates of proportions are somewhat extravagant. The first accurate surveys were conducted by James Hall in 1842. Since that time several have been made and it is on these instrumental observations that the rate of recession is based. New York and Ontario have both created reservations to protect the falls and a special international board is in control. Several great bridges cross the gorge and the river. In 1910 twelve municipalities began to draw electric power from Niagara Falls, and the number increased to over 200 in Canada alone within the next twenty years. Several hundred thousand people annually visit Niagara.

WEATHER PROVERBS

A sort of folk lore, a group of sayings or proverbs have grown up concerning the weather, which are quite generally believed by the peoples who have originated them. Many of these proverbs seem meaningless at first; yet, when analyzed, some of them are found to be based on scientific facts. Almost any one can think of a number that are widely known and quoted. Who has not heard of "Rain before seven, clear before eleven"; "Rainbow at night, sailor's delight"; "Rainbow in the morning, sailors take warning?" These and similar proverbs have a real scientific background.

Then there are others which arise from the mistaken belief that somehow things are evened up; hence we have such expressions as "A green Christmas and a white Easter" and "A hot summer and a cold winter." There is also an unwarranted belief that plants and the lower animals somehow know what the weather is to be. For example, most of us have heard the ground hog story, or that of the thick corn husks and a cold winter, the adage concerning the early or late molting of fowl; the early, or late, migration of birds, and the like.

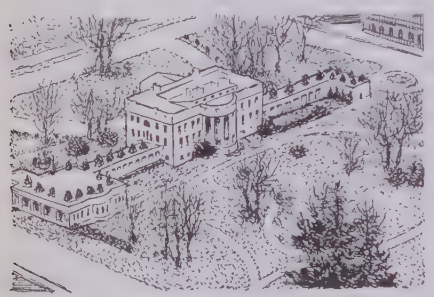
WEDDING ANNIVERSARIES

There are various lists given, some suggesting straw for the first anniversary, others reversing the order of the first two here noted.

First year	Paper
Second year	Calico
Third year	Muslin
Fourth year	Silk
Fifth year	Wood
Sixth year	Iron
Seventh year	Copper
Eighth year	Bronze
Ninth year	Pottery
Tenth year	Tin

Fifteenth year	Crystal
Twentieth year	China
Twenty-fifth year	Silver
Thirtieth year	Pearl
Thirty-fifth year	Coral
Fortieth year	Ruby
Forty-fifth year	Sapphire
Fiftieth year	Gold
Fifty-fifth year	Emerald
Sixtieth year	Diamond
Seventieth year	Diamond
Seventy-fifth year	Diamond

WEDDING RING



The wedding ring had its origin in remote antiquity. The ring was used anciently as binding ceremonies, making agreements and grants and evidently extended to the most solemn of engagements—marriage. The ancient Greeks held that a small nerve runs from the ring finger to the heart; and therefore it was honored with the office of bearing the ring. In many countries the bride and bridegroom exchange rings during the ceremony. The bride places her engagement ring on the other hand before the wedding ceremony, replacing it later.

WHIRLPOOL

A whirlpool is caused by the meeting of two currents of water going in different directions. The more rapid and powerful these currents are the larger is the whirlpool. It may also be caused by one current being forced against a peculiar angle of obstruction. The most famous whirlpools are the terrific Maelstrom, off the coast of Norway, that is formed by tidal currents, and that formed by the waters three miles below Niagara Falls in the Niagara River.

WHITE HOUSE

The executive mansion, the official residence of the President of the United States is known both popularly and officially as the White House. Its location is on Pennsylvania Avenue, Washington, D. C., about

a mile and a half from the Capitol. The original site of this mansion was selected by President Washington in 1791. The original plan, made by James Hoban of Dublin, was selected through competition and the cornerstone was laid in 1792. The first tenant was John Adams, who occupied it in November, 1800. It was many years later before the entire building was finished.

Originally built of gray sandstone, and unpainted, the White House received its name after the building had been partially burned by the British in 1814, when it was rebuilt and, at the suggestion of President Jackson, painted white.

The building is two stories high, has a frontage of 170 ft., a depth of 86 ft. and a surrounding park of 75 acres. On the first floor are the rooms for the President's public functions; on the second, his living apartments.

In 1902, the White House was remodeled according to the original design of J. Hoban and a presidential office building was erected at the west end of the original residence.

WHITE HOUSE WEDDINGS

Date	*Contracting Parties*
Mar. 11, 1811	Anna Todd (cousin of Mrs. Madison) to Rep. John G. Jackson.
Mar. 9, 1820	Maria* Monroe (daughter of President Monroe) to Samuel L. Gouverneur.
. . . . 1826	Helen Jackson to John Adams (son and private secretary to President John Quincy Adams).
. 183–	Mary Lewis (daughter of a friend of President Jackson) to M. Alphonse Pageot.
. 183–	Miss Easten to Mr. Polk.
Jan. 31, 1842	Elizabeth Tyler (daughter of President Tyler) to William Waller.
May 21, 1874	Nellie Grant (daughter of President Grant) to Algernon C. F. Sartoris.
June 19, 1878	Emily Platt (niece of President Hayes) to Gen. Russell Hastings.
June 2, 1886	Frances Folsom to President Grover Cleveland.
Feb. 17, 1906	Alice Roosevelt (daughter of President Roosevelt) to Nicholas Longworth.
Nov. 25, 1913	Jessie Woodrow Wilson (daughter of President Wilson) to Francis B. Sayre.
May 7, 1914	Eleanor Wilson (daughter of President Wilson) to William Gibbs McAdoo.

*Referred to as "Hester" and "Martha" in various accounts.

WIND

Wind is a current of air moving in the atmosphere in any direction or with any velocity. Winds are produced by variations of temperature in different latitudes, or at different portions of the same latitude.

Heated air tends to ascend, and, to prevent a void from arising in the lower portion of the atmosphere from which it has ascended, a current of air, colder, and therefore denser, takes its place. This phenomenon is most obvious in the tropics, from which hot rarefied air is ever ascending, one part toward the northern, and the other toward the southern polar regions. From these two regions, cold currents of air proceed near the surface of the ground or the ocean to supply the threatened void. Were the earth at rest, the hot currents would depart from, and the cold currents strike the equator at right angles, but owing to the rotation of the earth from west to east more quickly than its friction can carry the atmosphere with it, the latter is somewhat deflected to the westward, the hot currents leaving and the cold one striking the equatorial line at an oblique instead of a right angle. As the circles to be traversed by the rotating sphere or spheroid vary in magnitude in every latitude, cyclones tend to be generated which rotate in one direction, when they arise to the north, and in another when they are generated south of the equator.

The heat of the vertical, or nearly vertical, sun rarefies the atmosphere in the tropics over both land and water, not, however, to the same extent. Land is easily heated during the day and cooled during the night. Water is less easily changed in temperature, hence every tropical island is like a separate furnace, at work during the day rarefying the air and sending it upward, while, falling below the temperature of the ocean during the night, it modifies, suspends, or reverses the process, especially if the absence of clouds makes radiation great. Hence, land and sea breezes arise; the former blowing during the day from the sea to the land, the latter during the night in a contrary direction

Next, every high mountain is a refrigerating apparatus, capable of sending down its slope cooled air on all its sides, and consequently from every point of the compass. Even apart from these local complications, the higher the heated air which ascends from the tropics rises, the colder the atmospheric region into which it enters; it therefore ultimately parts with the caloric which enabled it to ascend and begins to fall, while the cold polar currents blowing toward the equator become heated and ascend.

In consequence of these causes there are eight principal directions in which winds blow: from the north, the northeast, the east, the southeast, the south, the southwest, the west, and the northwest. A north wind is one which blows from the north, not one blowing to that region, and so with the others. Classified according to the direction in which they blow, winds are divided into regular, periodical, and variable winds. The first are winds which blow all the year round in the same direction, as do the trade winds; the second those which blow regularly at the same seasons and the same hours of the day, as the monsoons, the land and sea breezes, and the simoon; the third, which blow sometimes in one direction and sometimes in another, as the prevalent winds of the temperate and arctic zones.

WORLD EXPOSITIONS

The first great international exposition in America was the Centennial, held in Philadelphia in 1876. There the telephone had its first public showing, and there many European countries exhibited their works of art and manufactures and brought to America an increased interest in arts and decoration. Among the most noted expositions, the following deserve mention. The British Empire exhibits at Wembly in 1925 and subsequent years are not international.

Date	*Name and Place*
1851	Crystal Palace, London
1855	International, Paris
1862	International, London
1867	International, Paris
1873	International, Austria
1876	Centennial, Philadelphia
1889	International, Paris
1893	World's Columbian, Chicago
1900	International, Paris
1902	International Exhibition of Modern Decorative Art, Turin
1903	International, Osaka
1904	Louisiana Purchase, St. Louis
1906	International (completion of Simplon tunnel) Milan
1915	Panama-Pacific, San Francisco
1915	Panama-California, San Diego
1926	Sesquicentennial, Philadelphia
1929	International, Barcelona
1933	Century of Progress Celebration,* Chicago

*First buildings erected in 1930.

Manual of Classified Questions for Examinations, Reading, and Study Courses

Agriculture

Name a disease of each of the following: cherry, currant, grape....382
What climate is best for celery culture?..382
What soil is the most suitable for growing onions?....382
What are the chief products of Porto Rico?....367
In what two seasons may lettuce be grown?....382
What are the best foods for dairy cattle in summer? In winter?....388d
When is the planting time for lettuce?...382
What is the average yield of beans per acre?....382
What northern berry bush does orange rust affect?....382
How does the average yield of wheat in Germany and England compare with that of the United States?....375a
What are some of the means used to build up the soil?....375b
Do commercial fertilizers improve the soil for more than one year?....375c
What makes soil dark?....375c
What are some of the important fertilizing materials?....375
When did the Mormons begin irrigation in Utah?....376a
How many acres of land were under irrigation in 1860?....376a
Name some suitable topics for the study of elementary agriculture in autumn. In winter. In spring.... 23a
What are some of the most effective means of drainage?....376b
Whom would you address to get free literature on agriculture?....376c
What are some of the things that determine yields of crops?....376b
What is meant by "Extension Education"?....376c
Explain briefly the work of the United States Department of Agriculture....377a
Give the origin and a brief history of tobacco....380
What is dry farming?....376c
What are some of the courses offered in an agricultural college?....377
What is the length of life of the dahlia, calendula, aster?....396
What State has the oldest agricultural college?....377a
In what form are the results of Experiment Stations to be had?....377a
What is plant breeding?....377b
What is the color of the California poppy?....396
Of what value is the seed testing box?....377c
What is the value of farm products exported from the United States in a single year?....377c
When is the planting time for the chrysanthemum?....396c
When was the first society for the advancement of agriculture founded in America?....376c
Is red clover a native of America?....378f
How does agriculture rank among American industries?....377c
What distance apart should lilac bushes be planted?....396e
What are some of the varieties of roses?..397a
What Canadian Bulletin will explain the use of alfalfa, its diseases and remedies and fertilizers?....378
Name a disease of barley; of corn; of oats....378
Give a brief history of alfalfa. What soil is best for it?....378
What vegetable requires a cool season?..384b
What orchard fruits are affected by the San Jose scale?....385a
What is the soil requirement of alfalfa; what is the planting time in the North?....378
What is the normal yield of rice per acre?....378
Is the watermelon free from disease?....384
To what climate is asparagus best suited?....380b
How deep should the sweet pea seed be planted?....397
How many strawberry plants should be planted per acre?....384
What is the best way to get rid of the Hessian fly in wheat?....381c
Name three breeds each of turkeys, ducks, and geese....394a
What is the treatment for the following diseases of cattle: mange? ringworm? indigestion?....389b
Give briefly some breeding rules for sheep....391a
What are the symptoms of hog cholera?..393b
Tell how to carry on an experiment showing the effect of air on the soil.... 23c
How is soil formed?.... 23c
Do plants give off moisture?.... 24b
How can one test seed corn or garden seeds for vitality?....377c
What kind of soil is best adapted for tree and fruit growing?....376a
How may crops be improved in yield and quality?....377b
What kind of soil is best for clover?....378
What time of the year should mangels be planted?....378
For what is millet used?....378
What is the normal yield per acre of rye?....380
What are the characteristics of the Clydesdale horse?....386
Give some characteristics of the Guernsey cow....388
What are the symptoms of diphtheria in a chicken?....393b
What breed of chicken is the best for egg production?....392c
What is the treatment for sheep with grass staggers?....391bc
How may chickens be cured of gapes?...393
When is the time to set out apple trees?..380
What is the most valuable farm crop in the United States?....405
What is the second most valuable farm crop in the United States?....405c
How may lampers on a horse be cured?..387c
Where was corn first raised?....378d
What was the effect of the National Reclamation Law of 1902?....376a
How may a farmer rid his field of chinch bugs?....381bc
What is the value of teaching agriculture in rural schools?.... 23
What farm crops returned to the soil in the form of manure will supply the most nitrogen and phosphorus?....376a
What is the remedy for smut in barley?.379bc
What insecticide should be used for worms on cabbage?....383b
Has any State more than one Experiment Station?....376b
What soil is best for wheat?....380b
What should be used to spray apple trees to prevent scale?....381b
What is the normal yield of wheat per acre?....380e
What is the method of control for fire blight of the apple?....380f
What is a good spray for strawberries when affected by the blight?....384f
What soil is best for grapes?....382c

Algebra

What is algebra?....838a
What is the most important tool used in algebra?....838a
A dealer sold his stock of used Fords at $430 each and Buicks at $920 each. There were three times as many Fords as Buicks. He received in all $15,470. How many cars of each kind did he sell?....839c
Sixteen coins, quarters and dimes, amount to $2.95. How many of each?....841c
Six horses and eleven cows cost $810.00. Thirteen horses and five cows at the same price cost $1,190.00. Find the cost of each animal....845a
A farmer pays six men and eight boys $32 for a day's work. The next day, paying the same wages, he pays ten men and two boys $42 for the day's work. How much does he pay a man? A boy?....847a
A rectangle is 15 feet long and its area is 36 square feet more than a square of the same width. How wide is it?....854c
A farmer sets out apple trees so that the number of trees in a row is two more than the number of rows. If there are 624 trees, how many rows and how many trees in a row?....854b
To pay $245 use $20 and $5 bills only and three times as many fives as twenties. How many of each?....839b
There are twice as many lights on the first floor of a house as on the second floor. There are 48 lights on both floors. How many on each?....838b
A man rows five miles per hour in still water. It takes five hours to row upstream a certain distance, and only four hours to return. How fast does the current flow?....844b
Multiply $(x - 5)$ by $(x - 6)$....852b
A fraction having 70 for its numerator is inverted and multiplied by 6. Its new value is one more than its original value. What is the fraction?....854c
One line is 3 times another and half the shorter line is 20 inches less than the longer line. Find the length of each line....842a
John is twice as old as Will; 18 years ago John was 5 times as old as Will. How old is each?....840c
Apples cost 15 cents a dozen less than oranges. If two dozen apples and three dozen oranges cost $1.65. What is the cost of a dozen of each?....841a
One angle of a stripe is 7 less than twice the other. Find the number of degrees in each?....841b
I sold canned corn at 11 cents a can and five times as many cans of tomatoes at 14 cents each, and one can of peas at 12 cents. If the total receipts were $4.98, how many cans of corn and tomatoes did I sell?....840a
In paying $68, I used only $5 and $2 bills. The number of $5 bills was three times the number of $2 bills. How many of each?....839b
One angle exceeds half another by 15 degrees and exceeds the complement of their sum by 20 degrees. Find the angles....842c

A boy can ride on his wheel 10 miles per hour and walk 4 miles per hour. How long will it take him to go 126 miles if he rides half the time and walks half the time?....843b

Architecture

Why is architecture often called "the mother of the arts"?....1099a
When are choir stalls regarded as furniture and when as a part of architecture?....1098c
Name some noted examples of Mohammedan architecture....1103bc
What three elemental types of construction control the form of all architecture?....1099a
What is meant by "Romanesque" architecture?....1101b
Describe the three Greek orders....1100c
What building is regarded as the pearl of Indian architecture?....1102ab
What materials have been used chiefly in Chinese and Japanese architecture?1103c
What examples of Egyptian architecture may still be seen?....1099c
When did the Renaissance in architecture begin?....1102c
What did the ancient Persians add to the architecture of their day?....1100b
When did architecture reach its peak as a fine art?....1102ab
Give some examples of the Parvenu style....1104ab
In what style of architecture is the Notre Dame Cathedral built?....1101c
Name five examples of modernism in architecture....1104bc

Arithmetic

What is a rapid method of addition used by bankers?....802
What is a good way to teach a child the time of day?....805a
How can a child easily learn liquid measure?....805a
Give a method to teach a child to make change?....805b
How teach a child the use of the calendar?....805b
How teach children square measure?....805b
How teach a child dry measure?....806a
How may children be given the first ideas of fractions?....806a
How many pints in a gallon?....813c
Give the table of dry measure....813c
What is the legal weight of a bushel of coal in the United States?....815
What is the legal weight of a bushel of potatoes in the United States?....816
What is the unit of mass in Japan?....816a
What is the funt?....817a
Give some simple problems in fractions adapted to children....806b
Illustrate a drill that will develop a knowledge of addition for children....802a
Demonstrate the Civil Service Method of adding....802b
What is the Computers' Method of subtraction?....802b
Give two drills in multiplication?....803a
What is meant by "number stories" in multiplication?....803a
Give a method of proving multiplication.803b
What is a good method of teaching a child division?....803b
Demonstrate two drills that develop a knowledge of division in children....804a
What are prime numbers?....804b
How many barleycorns make an inch?..813c
In arithmetic what is a league?....813c
How many feet in a fathom?....814a
How many cups of flour make a pound? 813c
How many eggs ordinarily weigh a pound?....813c
For what is the "hand" used in measurements? How many inches in a "hand"?....813c
What is the starboard watch?....814a
What is the meaning of two bells in the first dog watch?....814a
What is the Doyle Rule of measuring lumber?....814b
What is the miner's inch?....814b
What is the farthest distance an object may be seen from a mast 100 feet high at sea?....814b
What is the smallest unit in measureing drugs?....813b
How many drams in an ounce?....813b
In weighing coal, how many pounds in a ton in Colorado? In Pennsylvania?.815
For tariff purposes what does Congress fix as the weight of a ton of coal?....813b
What is the Metric System? From what unit was the system developed? What are its advantages over any other system?....814b
What is the legal weight of a bushel of apples in Ohio? In Maine?....815a
What is the legal weight of a bushel of clover seed in New Jersey? In Wisconsin?....815
What is the legal weight of a bushel of sorghum seed in Missouri? In Minnesota?....816x
To what is the Portugal almude equal in American measure?....817ac
Where is the word "candy" used as a unit of weight?....817b
What is a "military pace?"....813c
How many cubic feet in a "shipping ton" of merchandise?....813c
Where is the word "pik" used in measurement?....817de
What is the weight of a British "stone?".818a
What were cubits used to measure in the Bible?....818a
When Naaman offered Elisha 6,000 shekels of Gold, about, how much was that in American money?....818b
In Matthew xviii:24 the debtor had been forgiven 10,000 talents, but refused to forgive his fellow servants 100 pence. How much of a contrast was it?....818b
Joseph was sold for twenty "pieces." How much was that in dollars and cents?....818b
What is the difference between the Fahrenheit and the Centigrade thermometer scales?....819b
What is meant by "high barometer"....945c
Why was Standard Time adopted?....819a

Astronomy

What is the meaning of the word "astronomy"?....883b, 885a
What prevents summers at the North Pole from being hot?....888b
How many of the elements known on earth have been found in the Sun?...890b
Name the eight principal planets in the order of their distances from the Sun..891a
How is the distance to the Moon determined? Illustrate by diagram....889ac
What constitutes the Solar System?....885a
Explain Foucault's pendulum experiment?....887bc
What composes the Sidereal System?...885a
What is the difference between a total eclipse and an annular eclipse of the Sun?....890c
Who discovered a new planet in 1930, and what has it been named?....892bc
What are some everyday uses of astronomy?....885a
Which planets have no satellites and which have nine?....892bc
Explain the planetesimal hypothesis....893a, 940c
What are the two general types of telescopes?....885b
What color are the stars and what do the colors indicate?....893b
What is the spectrograph?....885c
What are variable stars?....895a
When and by whom was the first definite proof that the Earth revolves around the Sun given?....887c
What is the ecliptic?....888a
How long would it take an airplane traveling 300 miles an hour to go from the Earth to the Moon? From Earth to Jupiter?....886
What is meant by "magnitude" of a star?....894a
What are the names of the most prominent mountain ranges on the Moon...889b
Describe a planetarium and explain how it aids in the study of astronomy....895bc
What is meant by "phases of the moon"?....888bc
Why can one not turn a telescope toward the Sun to examine its surface in the same way as the Moon?....889c

Botany

Give a practical definition of a plant....896a
Name and describe three kinds of plant tissues....900ab
What is photosynthesis?....901a
Describe a plant cell....896ab
What does the name "alfalfa" mean?...901c
What are the divisions of botanical science?....884a, 896bc
Why does the American beech often take possession of large areas?....902b
What are thimble-berries?....910b
How did Asa Gray explain classification in botany?....896c
What are the two major divisions of the seed plants?....898c
Where was the probably early home of the following: apple, banana, cabbage, corn, lemon, plum, rice?....901abc
What are fungi, and into what three classes are they divided?....897b
What family do botanists generally consider at the pinnacle of plant development? What well-known plants belong to this family?....899c
What do the angiosperms include?....898c
What kind of flower has the arbutus? Does the arbutus yield to cultivation?.902a
Why are bacteria sometimes called "fission fungi"?....897c
What plant used widely in South America to brew for a drink is a close relative to another used widely in America for Christmas decoration?...906b
Give three other names for the peanut...909b
What is the significance of scientific plant names?....899a
What is the function of stomata in plants?....900c
What are some other names for the amaranth?....902a
What trees have the largest flowers of any in cultivation?....907c
How long have the Chinese been eating radishes?....910b
Describe the bryophytes....898a
Define algae, and describe three kinds....896c, 897ab
To what household spice is camphor related?....903b
What common name of dodder explains its habit?....904c
Name three examples of the pteridophytes....898a
What kind of ginseng roots do the Chinese prize most?....905c
How does the lentil derive its name?...907b

Give three examples of gymnosperms...898c
Name three groups of the begonias.....902c
What is the "poor man's orchid"?.....903a
What is black tea?.....911c
What is made from the milky juice of the sapodilla?.....910c
How does the mistletoe get its nourishment?.....908b
Why has the use of indigo as a dye declined?.....906c
Are the house geranium and the wild geranium close relatives?.....905b
Why is the bloodroot easy to transplant from forest to garden?.....902c
From what is preserved ginger made?...905b
What citrus fruit is eaten whole?.....907a
What are two native American orchids?..909a
How may Virginia creeper be distinguished from poison ivy?.....912a
What plants are sold as "shamrocks" on St. Patrick's Day?.....911a
Describe an interesting plant relationship exhibited in lichens.....907b
What plant is said to have been used by Adam in the Garden of Eden to sew the first garments?.....912c
How does sorrel get its name and what does this reveal about the plant?....911a
How does the buckeye get its name?....903a
What is the correct horticultural name for grapefruit?.....905c
How large have roots of yams been known to grow?.....912c
What evergreen tree yields mace as a by-product?.....908c
Why is trillium an appropriate name for this flower?.....911c
Does the century plant wait a hundred years to bloom?.....903c
Name five kinds of wheat.....912b
How did the North American Indians gather wild rice?.....910c
Why is the mesquite a very useful plant?.908a
Is the dogtooth violet really a violet?....904c
From what is linseed oil derived?.....905a
What is the generic name of the clovers? What does it indicate?.....904a
Where did corn cockle get its name?....904a

Business and Commerce

What is the equivalent in United States money of a British pound sterling?...821
What is a foreign draft?.....420c
Compare the English imperial gallon with that of the United States?.....813a
What is the legal weight per bushel of barley in California?.....815f
What distinguishes law from custom?...1056a
What country has the most railroads?...362
What is meant by the phrases "standard of value" and "medium of exchange?".418a
What city is the central money market of the United States?.....421b
When were greenbacks first issued in the United States?.....419a
What is the lightest metal in common use?.....414a
What is the most useful metal?.....413a
What is meant by the "rate of exchange"?.....420c
What are the chief exports of Greece? Denmark? Ecuador?.....362
Historically, what are the five systems of law?.....1056a
What is the purpose of the clearing house?.....420b
When and where was the first electric street railway built in the United States?.....277e
What is real property?.....1062c
What is constitutional law?.....1056c
When and by whom was the steamboat invented?.....277e
What State has the most miles of railroads?.....364-365
What is the present ratio between gold and silver in United States coinage?..419c
What are some of the commercial products of birds.....413bc
How does the medium of exchange of Canada compare with that of the United States?.....419
How many grains of silver in the standard silver dollar of the United States? In the five-cent piece?.....419
For what is guano used?.....413a
Where does silk come from?.....413a
What is the purpose of a trust company?.421a
In making contracts, what persons are adjudged incompetents?.....1057b
What is a business corporation?.....1061a
How may a corporation be dissolved?...1061b

Chemistry

What is the difference between inorganic and organic chemistry?.....913a
Name ten industries where chemistry is important.....914a
What is a symbol? A formula?.....915b
State the ionic theory of solution.....917c
How are traces of arsenic detected?....921d
Distinguish between Indian saltpeter and Chile saltpeter.....927d
Chemically what are solder and pewter?.923d
What are the principal divisions of physical chemistry?.....913
What is Henry's Law?.....914b
Who discovered the periodic table?.....917a
What are hydrocarbons? Mention three.918b
What use is made of hydrogen fluoride?..922d
What part of the air by volume is nitrogen?.....924b
What is aqua regia?.....927
What has cobalt to do with some blue porcelains?.....922d
Define and illustrate a chemical equation.915c
Name and define the two principal divisions of analytical chemistry.....913c
What is Boyle's Law? Charles' Law? Avogadro's Law?.....914c, 915a
Name five compounds of iron.....923d
What are the properties of boron?.....921c
What is the melting point of sulphur?..926a
What is the chemical composition of laughing gas? For what is it used?..927
What did Rutherford do that the alchemists failed to do?.....918a
Describe potassium physically and chemically.....925c
What are four branches of applied chemistry?.....914a
What three elements in different proportions make up sugar, alcohol, cotton and starch?.....915a
How does chlorine occur in nature?.....922b
What alloy is made of zinc and copper?..927d
Describe gold physically and chemically .923c
When is a solution said to be saturated?.914b
How many organic compounds are known?.....918a
How is copper prepared from its ore?....922b
What is the effect of adding vanadium to steel?.....926d
What is the kinetic-molecular hypothesis?.....914c
What is valence?.....917ab
Give three general methods by which the chemist prepares pure substances .914ab
How is tin prepared from its ore?.....926b
What is the lightest gas? The next lightest?.....923c
State briefly the principle of the conservation of matter.....915b
Where does iodine occur in nature?....923b
What is the Brownian movement?.....914c
Where does platinum occur in nature?..925b
Explain the chemistry of respiration....916b
What name is given to alloys of mercury?924d
What is usually the relation between solubility of solids and temperature?..914b
What is thermite?.....921d
Define electron and proton.....916c
What is the chemical composition of diamond? Of graphite? Of charcoal? 922c
Illustrate a double decomposition.....915c

(Chemistry of Foods)

What is food as defined by Congress?...918c
Where is Vitamin E found? What does it seem to be concerned with?.....919c
Describe the testing of food in a calorimeter.....920ab
For what are condimentals useful?.....919c
What is nitrogenous food?.....918c
What is the chemical name for fats?....919a
What is the most important sugar for human food?.....919a
Name four ways in which food may be adulterated.....920b
Name two of the most important mineral foods in nutrition.....919b
What sugar is important for dietetic purposes?.....919a

Civics

(United States)

What kinds of courts existed in the American Colonies?.....1044c
What is the Civil Service Commission?..1047a
Which President received the largest popular vote?.....1051
Give the Preamble to the Constitution..1091a
What is the order of Presidential succession?.....1086a
Who was the youngest President?.....1052
Why is there a need for government?...1043a
How many Presidents were self-educated?.....1053
What are the eligibility requirements for a United States Senator?.....1046a
What are the eight essential functions of government?.....1043ab
How many signed the Declaration of Independence?.....1088ab
What did the first Amendment to the Constitution provide?.....1095a
What were the important steps toward union taken by the Colonists?.1044c, 1045abc
How many states have the recall?.....1048b
Which President was a bachelor?.....1053
In which States is Labor Day not a legal holiday?.....1066a
What are sweat shops? Which states regulate them?.....1086a, 1072a
How may an alien become a citizen?...1085c
What are the principal powers of Congress?.....1045c, 1046a
How many Presidents have been elected without a majority of the popular vote?.....1050-51
How many judges sit in an appellate court?.....1064c
What are the duties of the President?...1046c
What penalty is inflicted on parents for violation of the compulsory education laws?.....1075ad
What is the commission form of government of a city?.....1084b
For how many years was John Marshall Chief Justice?.....1047c
Who was speaker of the House of Representatives during the World War?.....1046b
May employers interfere with the rights of employees as voters?.....1067c
Who was first to sign the Declaration of Independence?.....1088ab
What is the Interstate Commerce Commission?.....1047a
In which states is eight per cent a legal rate of interest?.....1065ab
What is an alien?.....1083b
How are territories and dependencies of the United States governed?..1048c, 1049a
What is the Federal Trade Commission? 1047a

How many government employees are there in the Indian Service? How many of these are Indians?....1049a
What are the four classes of the diplomatic group?....1084b
What have the States to say about hours of labor on public works?....1069a
How long does a member of the Supreme Court of the United States hold office?....1047b
Name five books on the Government of the United States....1096bc

(Canada)

What is the British North America Act? 1054a
What was the Constitutional Act of 1791?.... 284d
What is the Privy Council?....1055a
How is the Supreme Court of Canada constituted?....1055c
What are the powers and duties of the Sovereign?....1054c
When was the new diplomatic policy with the United States established?.. 296d
How many provinces and how many territories has Canada?....1054a
How is the Governor-General chosen, and what are his powers and duties?..1054c
What are the Executive Departments of the Canadian government?....1055a
What is the source of power in the Dominion government?....1054a
What are the powers of the Senate? Of the House of Commons?....1055ab
Name two books on the Government of Canada....1096c

Geography

What is geography?....309a
How do museums aid in the study of geography?....314a
What makes Chicago a favorable location for commerce?....337b
How should cut-up geographical maps be made?....313a
Why does Europe export very little of its wheat crop?....324a
What has retarded the commercial development of Africa?....357b
What natural trade advantages has France?....351b
Trace the route of the Erie Canal....333ab
What range of climate is found in Asia?..354b
What part of Africa is most desirable to the white race?....357b
What is the extent of the Atlantic Coastal Plain?....330b
Compare the area of Canada with that of the British Isles....347a
How is geography related to astronomy?....309c, 310a
Give five reasons for British leadership in trade and commerce....350c
What South American mountain range compares with the Rocky Mountains of North America?....348b
What is the Piedmont Plateau?....330b
What city is the metropolis of South America, and what natural advantages does this city have?....349b
Why is the valley of the Nile so productive?....357c
Indicate the general distribution throughout the world of the chief races of mankind....931, 932
What is the chemical composition of the Earth?....359a
What are the Magnetic Poles?....359a
What is the distance from Montreal to London?....373
What are the chief products of Alabama? 365a
What is the highest and lowest altitude of Oregon?....367b
Who is the present ruler of Portugal?....361
What is the nickname of the people of Kansas? Of Missouri? Of California? 365
What country has an area of only eight square miles?....362c
When, where and by whom were the following States settled: New York, Michigan, California?....364
What State is called the "Panhandle State"?....367e
What is the distance from New York to San Francisco?....373
Where is Mammoth Cave?....1193c
In what States are the inhabitants called "Webfeet"? "Beefheads"?....367
What was the total cost to the United States of the Panama Canal?....363
Describe the Panama Canal. Who started to build it?....363
Where is the Yellowstone National Park?....1216c
What is the title of the ruler of Turkey?..361d
What are the chief products of Missouri?.365a
What is the meaning of the name Missouri?.... 364b
What are the chief products of Alaska?..365a
What per cent of the total surface of the Earth is covered by the oceans and inland seas?....359b
What form of government has Japan?..361c
What is the state flower of Ohio?....367d
How far is it from Chicago to St. Louis?..371
What country has the largest population?....361-362
How far is it from New York to Panama? 373

Geology

What is geology and what are its principal divisions?....933a
Illustrate the conditions necessary for an artesian well....935ab
When did the mammals appear?....942d
What is diastrophism?....939a
What theory for the origin of the earth is most widely accepted?....940c, 893a
Into what three divisions does the geologist separate the earth....933a
How are most lakes produced?....937a
When did the first birds appear?....942d
Describe the constructive geologic work of plants and animals....937abc
What is the relation between faults and earthquakes?....939b
How much water falls on the surface of the earth every year?....933c
What estimates have been given of the age of the earth? What does geologic evidence indicate?....941bc
What are igneous rocks and how may they be classified chemically?....938a
When is a river valley said to be in "infancy," when "youthful" and when "mature"?....934ab
How are mountains formed?....939c, 940a
How extensive is the Antarctic ice cap?..935c
Describe the destructive geologic work of plants and animals....937a
What do fossils reveal?....941a
When is a stream known as a "pirate"?..934a
What is meant by the "profound abyss" of ocean?....936c
What is the difference between a mountain system and a cordillera....939c
Distinguish between erosion and weathering....934b
Name the five eras of geologic time and give the length of each....941bc
What is vulcanism?....938c
What explanation can be given of glacial motion?....935c, 936a
What has the study of seismograms shown about earthquakes?....939b
What is the difference between a stalactite and a stalagmite?....935b
What causes geysers?....939a
Describe the mechanical work of the atmosphere....933b

(Mineralogy)

What color are garnets?....945a
What is Moh's scale of classification for hardness?....944b
Where do the finest specimens of tourmaline come from?....945c
What is the most valuable variety of beryl?....945a
How has mineralogy been regarded before and after 1750?....943a
What is the ruby from Siam called?....945b
Where do amethysts come from?....944c
What are diamonds of the first water?..945a
Which are the precious stones?....944c
What is chalcedony?....945a

(Meteorology—The Weather)

What is meteorology?....944c
How do we know that air has weight?..945b
How are clouds useful in weather forecasting?....944c
How do winds affect the weather?....946a
What is an aneroid barometer?....945c
Describe three kinds of clouds....945a
How does the weather map aid forecasters?....946c
What causes a cold water pitcher to "sweat" on a warm day?....946a
Give four weather proverbs or sayings.1237c
What causes high and low pressure areas?....946b

Geometry

How is geometry useful?....856c
What is a solid? A geometrical solid? A surface? A line?....859a
What relation has geometry to sciences?.856c
When did people first start to use geometry?....856a
What is a point?....857a
What is a line?....857a
What is an axiom?....857a
What is a postulate?....857a
What equipment is necessary for the study of geometry?....857b
What is a segment?....857c
State five geometrical axioms....858c
What are adjacent angles?....858b
What is an angle?....858a
What is a straight angle?....858a
What is a polygon? A triangle?....858b
What is a complementary angle? A supplementary angle?....858c
What is magnitude?....858c
Define a broken line. A curve. A plane....859a
Prove—If one side of a triangle is greater than a second side, the angle opposite the first side is greater than the angle opposite the second side...861a
Prove the theorem—If two straight lines intersect each other the vertical angles are equal....862a
Prove that through three points not lying in a straight line, one circle and only one circle can be drawn....867a
What is a chord? A sector? A tangent?....866c
Prove this theorem—If in the same circle or in equal circles two angles at the center are equal, the arcs which they intersect are equal....867b
Show that the area of a trapezoid is equal to one-half the product of its altitude and the sum of its base....874b
How may a perpendicular be accurately drawn from a given point in a straight line?....877c
How may a triangle be constructed when two sides and the included angle are given?....878a
What is a scalene triangle?....880c

Prove that the medians of a triangle meet in a point two-thirds of the distance from each vertex to the mid point of the opposite side?.....880c
What is a corollary?.....881b
Show that regular polygons of the same number must have similar sides.....876a
Prove that the square of the hypotenuse of a right triangle is equal to the sum of the squares of the other two sides..874c
Why must the area of a rectangle be equal to the product of its base and its altitude?.....874a
Prove—If a straight line divides two sides of a triangle proportionately, it is parallel to the third side.....871c
Prove that a straight line tangent to a circle is perpendicular to the radius drawn to the point of contact.....869a
Prove—The diameter of a circle is greater than any other chord.....867a
What is a secant?.....866c
What is a lemma?.....881b

History

(United States)

What were the Alien and Sedition Laws?.180c
Why were the Minutemen of the Revolution so called?.....187
What changes of mind did Lincoln have regarding the freeing of the slaves?...200ab
What was the French and Indian War?.207bc
Name three events of Hayes' Administration?.....228
What was the *Trent* Affair?.....237c
How and when was the Republican party formed?.....228ab
When did Washington become the capital?.....180c
What was John Brown's Raid?.....190c
What was the Ballinger-Guggenheim Controversy?.....188c
What were the main buildings at the Centennial Exposition?.....194a
What famous song was written during Madison's administration? Who wrote it?.....195
What was the result of the Battle of Lake Erie?.....203a
How was the American Federation of Labor organized?.....208b
What was the Ashburton Treaty?.....213b
What was the Spoils System?.....217b
What were President Roosevelt's policies?.....231c
What disaster fanned the flame that resulted in the Spanish-American War?.....235b
Who was Boss Tweed?.....237c
When was the Panama Canal opened and what was the first American steamer to go through?.....243b
How many voyages did Columbus make to America?.....280a
When was the first trans-continental railroad completed?.....291c
When was the Erie Canal opened?.....274b
In what year was President Garfield assassinated?.....276b, 1052
What is the oldest college in America? 281c
Trace briefly the history of the American Colonies from King William's War to the signing of the Declaration of Independence.....282
Why did the Colonies separate from England?.....282
What were the causes and results of the War of 1812? Name two land and two naval battles of this war.....285
Name two campaigns in the American Revolution and give two battles in each.....283
When was gas for lighting first used?...285c
Describe the first airplane flight.....1183a
What kind of an airplane did Lindbergh use on his historic transatlantic flight?.....1184c
How did Beacon Hill receive its name?..1188c
Give five of the Blue Laws of Connecticut.....1189ab
How did the term Brother Jonathan arise?.....1191ab
In what year was the Naval Academy at Annapolis established?.....1217b
When was the first American medical school founded, and where?.....281b
Who were the Carpetbaggers?.....1193a
When was Florida purchased?.....286a
What was the Ordinance of 1787?.....283b
How did Congress in 1777 describe the flag?.....1201b
What two Presidents died on the Fourth of July of the same year?.....286a
When did the Populist Party appear?...293a
When was the Baltimore and Ohio Railroad chartered?.....286c
Who composed the committee which requested Betsy Ross to make the first American flag?.....1201b
How did the celebration of Labor Day begin?.....1206b
What circumstances surrounded the massacre of General Custer's troops in 1876?.....198c
Name four events of Cleveland's administration?.....196ab
What were the White Leagues?.....243ab
What was the result of the invention of the cotton gin?.....242c
How did the celebration of Memorial Day begin?.....1206c
Describe the Statue of Liberty and tell who designed it.....1209a
Describe the discovery of gold in California.....235a
When was rural free delivery of mail begun?.....196b
What was the Free-Soil Party?.....229b
How was Oklahoma originally secured?..225a
What is the Monroe Doctrine?.....223ab
How was the Life-Saving Service established?.....219a
What is the National Salute?.....1226b
Where and what is Statuary Hall?.....1227c
Who made the original plans for the White House?.....1238a
What was the Kitchen Cabinet?.....217b
Name three important events of Hoover's administration?.....215a
What were the losses in the Battle of Gettysburg?.....210ab
What is the plan of the Federal Reserve Act?.....204a
What were the chief events of Coolidge's Administration?.....197ab
What effect had the Battle of Bull Run on the North?.....192a
When were Negro slaves first brought to Virginia?.....281a
What did the Treaty of Ghent provide?..285b
When was the steam locomotive first successfully used?.....287c
Name the principal battles of the Mexican War.....289a
Who was the American commander in the Battle of Manila Bay?.....294d

(Canada)

Who were the first Europeans to see the land that is now Canada?.....192b
When was Canada divided into two provinces, and when reunited?..284d, 288d
What part did Louis Riel play in Canadian history?.....291d
When and how was Manitoba named?...723b
How did the Jay Treaty affect Canada?..284d
When was the first Canadian newspaper published?.....285d
How was slavery abolished in Canada?...284d
When was the Reciprocity Treaty with the United States made?.....289d
When did the first parliament of the United Canadas convene?.....288d
In what battle did Montcalm and Wolfe die?.....590
When and how were Vancouver and British Columbia united?.....291d
When did Quebec hold a tercentenary celebration?.....295d
When did McGill University open? Where is it located?.....288d

(General)

How did Lord Bryce define history?....179a
What form of religion prevails in Abyssinia (Ethiopia)?.....180a
In what work of literature is Troy immortalized?.....185c
What was the Spanish Armada?.....184c
When was the Suez Canal completed?...181b
What experience did Italy have in Abyssinia in the nineteenth century?..180a
When did Rio de Janeiro become the capital of Brazil?.....190b
What was the result of the Battle of Bannockburn?.....188c
How is Morocco governed?.....223c
What was the Code Napoleon?.....224a
What was the result of the Battle of Hastings?.....213c
As a nation, how old is Belgium?.....188c
What European nations have colonized Africa?.....181b
How long did the Babylonian Empire survive?.....185c
What was the Hanseatic League?.....212c
When was Cromwell made Lord Protector?.....270c
When did Tamerlane invade Russia?....267c
When were the Franks first mentioned in history?.....257c
What is the Permanent Court of International Justice?.....248c
Name five events of the World War....246
When did Spain begin to decline?.....235b
When and by whom was Christianity introduced into Sweden and Norway?..233b
Who were the Saracens?.....233a
When did Peru become independent?...190a
Why was Napoleon's victory at Austerlitz of great significance?.....186a
When and under whose leadership did Portugal found her first colony in Brazil?.....190b
What did Sobieski do for Poland?.....228c
What brought an end to the Persian Wars?.....227b
What caused the Peloponnesian War?..226b
What period is covered by the term Middle Ages?.....221c
What was the Boxer Rebellion in China?.....190ab
What was the object of the Gallic Wars?.208a
Why has the Balkan peninsula been called the "Whirlpool of Europe"?...188c
What people in ancient times settled in Algeria?.....182a
Where was the earliest cradle of human knowledge?.....185c
With what does Irish history begin?....215c
What was the Holy Alliance?.....214c
When did Victoria become queen of England?.....274c
What is the date of the act of union of England and Scotland?.....270c
When was the term Asia Minor first used? What does it include?.....185c
How did Cyrus capture Babylon?.....188bc
What colonizing was done by the Phoenicians?.....227bc
When did the Netherlands become independent?.....214b
What contributions to the world were made by the Babylonians?.....186a

What two classes in France brought on the Revolution?....207c
Who made the first visit of record to Australia?....186b
When did the Parthian Empire flourish?.226a
What was the First Punic War?....229bc
Why was the War of the Roses so called?.231c
What brought on the dissolution of the Roman Empire?....231bc
What was the name of Scotland in Roman times?....233b
What was the Seven Years' War?....233c
When did George V become king of England?....278c

Hygiene

What is a calorie?....993c
How many calories a day are required by boys of nine to ten years of age? By girls of the same age?....994c
Compare the speed of travel of an active bacterium with that of a champion human runner....997a
Name five chemical disinfectants 1001bc, 1002a
Where is dysentery prevalent?....1003b
How may the spread of mumps be prevented?....1005a
How does scarlet fever spread?....1006b
How much water should one drink every day?....1014
How may mosquitoes be controlled?...1011b
What is meant by a "common cold"?...1002c
What is parasitism?.... 995c
What is the difference between natural and acquired immunity?.... 999c
What is the special value of Vitamin A? Of Vitamin B? Name three foods rich in Vitamin A; in Vitamin B....1014
How does filtration purify water?....1009b
What disease causes 10% of the deaths in the United States?....1005b
What causes hookworm?....1003c
What are antibodies?....1000a
Name ten common bacteria.... 997c
What are nutritional diseases?.... 995b
Explain how the body is a "heat machine".... 993c
Define roughage and explain its service to the body.... 995a
What is anthrax and how is it controlled?....1002bc
What disease did Sir William Osler consider perhaps the most destructive in the world?....1004bc
What diseases are often traced to infected milk?....1009c
What disease in the United States is most fatal?....987c, 1013b
In terms of chemical composition, what are the six components of food?.993c, 994a
What three general shapes do bacteria exhibit?.... 997a
What discovery important to immunity was made by Edward Jenner?....1000b
Is cancer infectious or communicable?..1008c
How may the spread of infant paralysis be controlled?....1005c
What are the five vitamins?.... 994ab
Name two harmful soil bacteria.... 998ab
On what five points does the control of measles depend?....1005a
Name five natural defenses which the body has against microscopical and other enemies.... 999bc
Compare the size of bacteria and raindrops.... 996b
What is the value of ergosterol?.... 994b
What is the most important childhood disease and what causes it?....1003a
What are the two general forms of tuberculosis?....1007c
What is the Black Death? What causes it?....1011bc
How should influenza be treated?....1004ab

Industry

Where are the following manufactured and used: cotton, silk, linen, rubber? 405, 413, 404, 409, 398
How is rice grown and what are its uses?....398cd
Describe the manufacture of sugar....399
Where are the following mined, manufactured and used: iron, lead, zinc, aluminum, platinum? 413, 414
What country manufactures more tin than any other?....416c
How are the following obtained: amber, graphite, petroleum, carborundum?..418
What important metal is mined in Ontario and New Caledonia? For what is it used?....416c
Name some of the carbon compounds..418ab
What fruits are exported from the United States and Canada to England?....399d
Name three insects, which are important commercially....413b
Why is sarsaparilla valued as a medicine?....402d
Is buckwheat less used than formerly?...399d
What are the chief articles of commerce produced from cattle?....410b
What uses other than for cooking utensils are made of aluminum?....911d
How and where is vegetable ivory obtained?....410a
What commercial articles are produced from the wood of the ash tree?....407ab
What is camphor?....409a
What is the difference between cocoa and chocolate?....400d
For what is mahogany wood used?....407d
Name three sources of sugar....399a
How is opium obtained?....402c
Where are the great fisheries of the world?....412c
Where are the bananas used in England grown?....399d
Name some of the numerous products of Indian corn?....398b
Of what is catgut made?....412c
What State leads in the production of zinc?....370
What State is next to Pennsylvania in output of coal?....370
What State is the largest producer of salt?....370
How are olives treated for pickling?....401d
Is rhubarb used for anything but food?..402d
Give the steps in the preparation of coffee from the time it is harvested until it reaches the table....400d
How is quinine obtained?....402c
How is sugar cane harvested? Name three articles produced from it....399abc
What country leads the world in the manufacture of silk?....413a
What are some of the fur producing wild animals?....412b
What countries supply the United States with bananas?....399d
Where are the following cultivated: nutmeg, caraway, cinnamon, vanilla?.401c
Of what is macaroni made?....398d
What medicine is made of the dried bodies of beetles?....413a
Where is sulphur obtained?....417b
What is nux vomica?....402a
For cabinet work is oak or chestnut better?....407d
What is isinglass?....412b
What are the chief products of coal?....418b
What is cacao?....400a
What is the origin of the word "nicotine"? 380f
What four States produce the most gold?....370fg
Of what is carbolic acid made?....418b

Interior Decoration

What is the twofold purpose of interior decoration?....1171a
Why has ancient Egyptian furniture come down to us well preserved?....1162a
What conditions govern a good Colonial dining room?....1176c
Name and discuss six important principles in interior decoration....1171abc
What characterizes Louis XIV furniture?....1167b
Describe some of the styles of furniture designed by Chippendale....1168ab
What characterized the furniture of Heppelwhite?....1168c
What marks American Empire furniture?....1170a
What did Roman color schemes reflect?.1172b
Name a set of color charts valuable to the student of interior decoration...1173a
In recent years how has the term "library" changed in significance?...1175b
What are the four general classifications of Oriental rugs?....1178a
Name two books of reference on interior decoration....1180c
Describe two treatments of breakfast rooms....1177ab
What decoration should be given to a bedroom?....1177c
What are "Twentieth Century Primitives"?....1170c
How may one know which colors harmonize?....1195c

Language

What are the meanings of the different signs in proofreading?....103a
Should a period be placed after Roman numerals?....103a
Is there a difference between argument and debate?....104
Distinguish between the after dinner speech, the address, the oration, the lecture and the sermon....104-105
What are the three essentials of a business letter?....106a
What is essential in answering a complaining business letter, or in sending out collection letters?....106b
In what person should formal social notes be written?....106c
What is a metonymy?....110b
Give and illustrate five rules for the use of capital letters....103c
What is meant by "amateur"?....111b
Which is correct "Your family is healthful," or "Your family is healthy"?...112b
Is "Not as I know of" correct?....112c
What is the good of figurative language?....109b
When, as a married woman, should she write her name "Ellen Gates Adams," and when "Mrs. James Ward Adams"?....106b
What is a paragraph?....100a
Why is Spanish such an important language?.... 97c
What nation has been the greatest word borrower?.... 98b
What is meant by "converse error"?....100c
Name some figures of the "identity" type....109c
When should the comma be used?....103b
Give some general rules of punctuation..103a
Into what branches and families have the languages of the world been divided?.... 97
Why is it incorrect to say "The same thing is true of the doctor, lawyer, or any other profession"?....102b
What is incorrect in the phrase: "the above statement"?....110a
Distinguish between learn and teach....111b

Give the meaning of P. M. G.....115c
What is the meaning of "volplane"?....781c
What are some of the so called "universal languages"?..... 99a
What conquest caused the introduction of most of the French elements into the English language?..... 98b
Pronounce "alien".....638b
How can idioms be learned?.....102c
What characterizes a good sermon?....105b
Is "orate" a good word?.....111c
What is Esperanto?..... 99a
What diction should be used in journalism?.....105a
What is meant by the term "Practical English"?..... 99a
What are the chief requisites of a good oration?.....104c
When is it correct to use the word "per"?.....111c
In which of the following sentences is the word "only" misplaced? "She sang only for us;" "I only have one coat."....111c
Do we "lend" money or do we "loan" money?.....111b
Give an example of a vulgarism.....112c
What is the meaning of "roast beef *au jus*"?.....118a
What is the error in the sentence, "His conduct aggravates me"?.....110a
What is the meaning of the abbreviation, D. O.?.....113d
Illustrate the correct use of "credible" and "creditable."....110c
Give the meaning and pronunciation of *a la Polonaise*.....117b
What is meant by lobsters served *a la Roland* and *a la Newburgh?*.....117b
What word in the following sentence is superfluous and why? "A large crowd congregated together in the hall."....110c
What is the difference between "character" and "reputation"?.....110c
Is it correct to say, "I haven't got a dollar"?.....111a
What is the meaning of "April"?.....642b
How did Chicago get its name?.....661a
What is the Corpus Christi?.....669c
What is the origin of the word, "quiz"?.747b
What are the points of a good after-dinner speech?.....104b
Give an example of a simile.....108c
What is the meaning of Q. E. D.?.....115d
State a rule governing the use of "should" and "would."....112b
Give seven synonyms for "abandon," and explain distinction of meaning between them.....633a
What are two uses of the colon and two of the semicolon?.....103b
Is it correct to say "John clerks at the store"?.....110c
Does Adm. stand for Admiral or Administration?.....112c
What were the "Baths of Caracalla"?...647c
Punctuate and capitalize the following sentence: "Oh look they're being driven back."....103b
From what Indian word is "Sing Sing" derived?.....761c
What was Sherwood Forest?.....760b
What is the origin of the word "Wisconsin"?.....784b
What is the origin and meaning of "Winooski"?.....784b
In composition what should a title express?..... 99b
Why is it necessary to have an outline of what you write?..... 99b
In composition what is meant by coherence?..... 99c
How may the most important feature of a composition be emphasized?..... 99c
What is a practical gauge of proportion in composition?.....100a
What should the first sentence in a paragraph do?.....100a
What are the uses of short sentences and long sentences in the paragraph?..100a
What does "Michigan" mean?.....725c
What does "Milwaukee" signify?.....726a
What is the meaning of the word "Chautauqua"?.....660b
What is the meaning of "Chattanooga"?.660b
What is the meaning of "Scandinavia"?..757a
What is the meaning of "August"?.....645a
What is the abbreviation of California?..113b
Is it correct to say "Anybody can do as they please"?.....110b
How pronounce "Aberdeen"?.....633b
How do ability and capacity differ in meaning and use?.....110a
What is the difference between the abbreviation gr. and Gr.?.....114b
What is the pronunciation of "literature"?.....720c
Is "ensilage" the right word for fodder stored in silos?.....685b
Give facts for a composition on "Rubber".....408-9
What is a figure of speech?.....108a
What are the two essential elements that should be taken into consideration in writing short stories?.....105a
What is the correct style for a formal note?.....106a
Does a man "abandon" or "forsake" his evil habits?.....633
What is the meaning of the word "Niagara"?.....730c
What is the pronunciation of the word "aeronaut"?.....637b
Give examples of the following: trope, personification.....109a
When use the apostrophe?.....103c
What point should be observed in writing business letters?.....106

Literature

What was George Eliot's real name?....162c
How does Victor Hugo rank as a poet? Give three of his contemporaries in French literature; three in English literature 138ac
Name five noted writers born in 1811. 138-139
What was George Sands' real name?....164a
Name five books by Woodrow Wilson...630b
What is the theme of *Silas Marner?* How does it rank with the other novels by the same author?.....159b
Give a brief synopsis of *Ben Hur*.....150b
Who wrote *Luck of Roaring Camp?*.....142b
Who was the author of *The Count of Monte Cristo?*.....151c
Who was the author of *Don Quixote* and what was the author's purpose in writing it?.....152c
Give the names of five prominent German writers of the nineteenth century 135a
Name three contemporaries of Sir Walter Scott.....134-135
Distinguish between a myth and an allegory.....164a
What writer used the pen name "Uncle Remus"?.....164c
Give an account of the voyage of the Argonauts.....166a
How did the Sirens lure to destruction the mariners who passed their islands?. 174c
What was Mark Twain's real name?....164c
What did Napoleon write?.....134c
What was the nationality of Hegel and what did he write?.....135a
What is the theme of *The Iliad?*.....155a
Who wrote *Poor Richard's Almanac?*....158a
To what fabulous animal was ascribed the ability to eat fire?.....174b
What did Henryk Sienkiewicz write?....616a
What is the story of *Lorna Doone?*.....156b
Name two celebrated Grecian orators; two famous philosophers; two renowned Latin lyric writers.....122
What is meant by the term "Argus-eyed"?.....166a
What three great American writers were born in the same year?.....138b
Who wrote *Dr. Jekyll and Mr. Hyde?*...152b
What suggested the title "Bleak House" to Charles Dickens in writing his novel of that name?.....150b
Who wrote *Annabel Lee?*.....138b
Give the plan of *The Canterbury Tales.* How many were they in number?....151a
Who was the author of *Ramona?*.....158b
Who was Poe's foster father?.....603b
How old was Shakespeare when he married?.....615a
Did Harriet Beecher Stowe write anything besides *Uncle Tom's Cabin?*....620b
What stories next to the Bible have been translated into the most languages?.....139b
Who were contemporary writers of Homer?.....121
Who were David's contemporaries?....121
Who wrote *Robinson Crusoe?*.....131a
Who wrote the "Star Spangled Banner"? 134b
What were the "Twelve Labors of Hercules"?.....169b
Who was "The Danbury News Man"?...162b
Who was the god of the fine arts in Grecian mythology?.....165c
Who wrote under the assumed name of "George Fitz Boodle"?.....162c
Under what two pen names did John Ruskin write?.....163ab
Give the real name of Ralph Connor....161a
By what name was Zeus known among the Romans?.....175c
Who was the wife of Ulysses?.....173b
Give a brief synopsis of *The Ancient Mariner*.....149c
Name three of Longfellow's poems?....138b
To whom were applied the sobriquets: "Old Hickory", "Light Horse Harry", "Tippecanoe"? 163-164
Of what nationality was Zoroaster?.....121d
What is Frances Hodgson Burnett's real name?.....162b
Who was Juno?.....170b
What is the theme of Virgil's *Aeneid?*...149b
What was *The Vedas?*.....121d
What celebrated Danish poet was born in 1805?.....139b

Miscellany

Where is the International Date Line?. 1197b
Who coined the phrase "Almighty Dollar"?.....1186a
What is the conventional garb of mourning in the United States? In Persia? In Turkey?.....1213bc
When was the first America's Cup Race held?.....1186b
How did the expression "according to Hoyle" originate.....1207c
What is the national anthem of Poland?.1214a
What is the motto of the Lions Clubs?. .1219c
What is meant by "printer's devil"?...1224c
What is the origin of *sub rosa?*.....1235c
Describe the early Montgolfier balloon.1181c
Describe the great earthquake at Lisbon, 1755.....1199b
What is the difference between a hot spring and a geyser?.....1203b, 1207bc
Where is the "Little Church Around the Corner"?.....1209c
What national cemeteries does America have in Europe?.....1214b

How many large natural bridges are there in the United States?....1217b
When was the Grand Army of the Republic established?....1219c
What world exposition was held in St. Louis?....1238c
What is the right way to walk?....1236b
What are the color signals used in railroad signaling?....1230c
How did the name Santa Claus originate?....1226b
Is phrenology a science?....1224b
What is smoke?....1227c
How did the practice of tipping begin?..1230a
Where is the Moffat Tunnel?....1234c
What are the Watches of the Night of the Bible?....1236b
What scientific methods are used in caring for trees?....1233
What primitive telegraph system did the American Indian use?....1229a
What are the Five Follies of Science?..1226b
What is meant by the "potter's field"?..1224c
What is the patron saint of England? Of Ireland? Of Italy?....1222a
Where is the Passion Play held? How often?....1221bc
What was America's first semi-rigid airship?....1182b
When and by whom was the South Pole first visited by air?....1185ab
What are Blue Sky Laws?....1189b
What is the origin of the Black Maria?..1189a
Where is America's Tomb of the Unknown Soldier?....1191c
Name and locate five famous "gardens" of the world....1203a
When was the Washington Monument built?....1191b
What makes the sky appear blue?....1189b
Who first flew across the English Channel?....1183b
What has been called the "American Rhine"?....1186b
Is astrology a science?....1188a
What is the chemical composition of man?....1186c
Where are edible birds' nests found?...1200a
For what is Wyandotte Cave noted?...1193c
What are the leading press associations? 1224c
Where is the United States Naval Academy, and when was it founded?..1217b
What is the origin of the wedding ring?..1238a
How did the expression "Uncle Sam" originate?....1235c
Who discovered Niagara Falls?....1237c
What are the two chief varieties of typewriters?....1235b
What causes thunder?....1230a
Who solved the riddle of the Sphinx?....1227c
What is the origin of the pawnbroker's sign?....1222b
What are the objects of the Rotary Clubs?....1220bc
What book won the Newbery prize in the first year it was offered?....1218b
What is the National League of Women Voters?....1215a
What are two recent important developments in the motion picture field?....1212c
What is the origin of Hallowe'en?....1206b
What is meant by "Hobson's choice"?..1205b
In the symbolism of flowers, what does the rosebud signify?....1202c
What colors harmonize with maroon?...1195
Where is the Lincoln Memorial?....1191b
How did the term "blue stockings" originate?....1189c
Who first circumnavigated the globe in a lighter-than-air craft?....1185a
What is Ido?....1236a
What is a "tinker's dam"?....1230a
What were the Seven Wonders of the Ancient World? .... opp. 1181, 1226c
What are the Pulitzer prizes?....1225b
When was the American system of patents established?....1222a
What was the fate of the Apostles?....1187bc

Music

Why has music been called the "Universal Language"?....1139a
What are the five classes of folk music? 1141b
What is the national anthem of Australia? Brazil? France?....1213c
According to legend, what did Orpheus accomplish with his music....1140a
What did Gluck do for the opera?....1144a
What is the meaning of "barcarolle," "cadence," "carillon"?....1152c
What is the most popular folk instrument in the world?....1150c
Name two of the Minnesingers....1151a
What are the percussion instruments of the orchestra?....1149c, 1150a
In the symphony orchestra what constitutes the string choir?....1148c, 1149a
What was Brahm's contribution to music?....1146a
What two great composers dominated the first half of the eighteenth century?....1143
What are the three component parts of music?....1139a
What historic interest to music lovers clusters around the town of Eisenach?....1142c
What is the *vina?*....1140c
What are the negro spirituals?....1147b
Who was perhaps the greatest personality in music?....1144b
For what form of musical composition is Richard Wagner noted?....1145b
Who were the *camerata?*....1143a
Name four Russian composers of the nineteenth century....1151c
What tribe of American Indians are said to possess more than 15,000 different songs?....1147b
When was the Chicago Symphony Orchestra founded?....1148a
Define mazurka; intermezzo; leitmotif. 1154a

Painting

What is design in painting?....1113a
Name five great Italian painters of the thirteenth or fourteenth centuries..1125ab
Name and describe briefly a noted painting by Rembrandt....1127, 1129
Characterize Byzantine painting....1115a
Who was the leading spirit of Post-Impressionism?....1123c
When were the oldest paintings that we know painted?....1113a
What is the story represented in Giotto's *The Miracle of the Spring?*....1115b
Describe briefly the work of Holbein...1120c
What peculiarities marked the work of the early Egyptian painters?....1113bc
What great church built over a tomb has been called the cradle of Italian painting?....1115b
Describe briefly the typical work of Giorgione....1117b
What combination of traditions found expression in the works of Rubens?...1120c
What characterized medieval Irish painting?....1118a
What was the Roman contribution to Hellenistic naturalism?....1114c
Compare and contrast the work of Botticelli and Leonardo da Vinci....1116c
Who were the greatest Flemish painters?....1119a
What is another name for the painting *Mona Lisa*....1131d
Name and describe briefly three of the paintings of Frans Hals....1129abd
Name five modern French painters....1127d
Name and describe briefly three of the paintings of Velasquez....1130abd
What work of El Greco is in the Chicago Art Institute?....1128ab
Name five of the graphic arts allied to painting....1098bc

Physical Training

Draw and label a diagram of a baseball field....1020b
What is the Code of Sportsmanship as adopted by the Sportsmanship Brotherhood?....1015ab
What are the main wrestling holds?...1042b
Where is cricket a national sport?....1028c
Draw a diagram for hopscotch....1034b
Where did cricket originate?....1029a
Who are the Boy Rangers?....1023ab
What are the early promotions among the Boy Scouts?....1024a
Who founded the Woodcraft League and what are its aims?....1025b
What is the national game of Canada?..1033c
What are Honors and Ranks among the Camp Fire Girls?....1024a
What are the Athletic Badge Tests for boys?....1015-17
What are the Motor Ability Tests?...1018-19
What is the aim of the Girl Scouts organization?....1024b
How old is the game of polo?....1035c
What is the Junior Life-Saving Test?..1017b
What is "dribbling" and "holding" in basket ball?....1021c
How is the shotput conducted?....1041c
Where was golf originally played on the ice?....1031b
Draw a diagram of a tennis court....1039
What is the Pentathlon?....1018b
What are the dimensions of a football field?....1030a
What are "camps by the way"?....1025c
When and where was archery once a matter of life and death?....1019a
What is the meaning of the "Four H's" in the Clubs of that name?....1024c
How does indoor baseball differ from outdoor baseball?....1033bc
What is the English name for soccer?..1037b
What are cross-country runs?....1040c
Name five books of reference on physical education....1042c

Physics

What are the major divisions of the science of physics?....947ab, 948
What is inertia?....949c
Define, ampere, ohm, volt, watt....954a
What is the measure of gravity?....950a
What does the term "radio" cover?....955b
Give three examples each of: good conductors of electricity, poor conductors, insulators....953a
Give two examples of wind instruments. 951a
How many molecules of hydrogen are there in a glass of water?....947c
What is mechanics?....949c
Why is a man's voice lower than a woman's?....951a
Describe an ordinary dry cell....954b
What are the three important characteristics of sound?....950c
What are the colors of the spectrum?...952a
What service did wireless render in the World War?....955c
What are ultra violet rays?....952c
Do molecules have freedom of motion in gases? In liquids? In solids?...947c
How does the cavity of the mouth increase the loudness in playing a Jew's-harp?....950c
How did electricity get its name?....952c

Briefly describe the essentials of a telephone....955a
What surfaces absorb heat best? Which radiate it most rapidly?....949a
What is the difference between electrostatic and electrodynamic action?..953a
What is the photoelectric cell? What is its use in television?....954c, 955a
What are the two important sources of electricity?....954b
What is heat?....947ac, 948, 949a
What are the three primary pigments?..952b
Show graphically how a radio program is sent and received....955bc
What is the difference between kinetic and potential energy?....950a
How may one tell how far away lightning is?....954a
What lengths of waves are used by amateur radio operators?....956c
Why must engineers respect the elastic limit?....950b
Describe one method of putting sound into motion pictures....955ab
What are some good conductors of heat? Some poor conductors?....949a
What are some commercial uses of compressed air?....950b
What did each of the following have to do with electricity and magnetism: Oersted, Joseph Henry, Faraday?....954a
Name three ways in which heat may affect substances?....949a
Give an example of each of the following: transparency, translucency, opacity..951c
Why is mercury used in thermometers?..949a
How fast does light travel?....951b
In what three states may water exist? What are the temperatures of each of these states?....949b
Upon what does the natural rate of vibration of a wire depend?....951a
Why can one tell the difference between sounds coming from the piano and the violin?....950c
What are complementary colors? Illustrate....952a
Give an example of rotation without friction? With friction?....950a

Physiology

What is the difference between anatomy and physiology?....977a
How may the human body be compared to a factory?....979
Give five functions of the skeleton....980c
Trace the route of the breathed air from the nose to the lungs....985a
What are the required hours of sleep for children from five to twelve years of age?....990bc
Where is the nasal cavity located?....992c
Which are the "floating ribs"?....978c
What is the smallest living unit of any living body?....977c
Where are blood cells manufactured?..980b
What does the gastric juice contain?....982b
What are the names of the permanent teeth and how many of each?....983b
Name two glands which are important as defense organs....988ab
What is the function of the Eustachian canal?....992a
Explain voluntary and involuntary muscles....981b
What parts are common to most living cells?....978a
What is auto-intoxication?....983a
What is diastole and systole?....986c
What are the special senses?....990c
What is a system?....977c
How many bones in the human skeleton? 978c
How may flat-foot be corrected?....981a
What are the Haversian canals?....978a
What is the "zone of comfort" (best temperature) for most individuals?....985c
What results may come from disease of the pituitary gland?....989a
What proportion of the bones is mineral matter?....978a
Explain the two functional and structural parts of the inner ear....992b
What is the best insurance for sound teeth?....984a
What name is given to the unit bones of the spine?....978c
Name three true "tastes."....992c
Name the parts of a typical nerve cell..978b
What are the three parts of a tooth?..983b
What is the correct treatment for fainting?....987c
Explain the cause of near-sightedness and long-sightedness....991c
Why are the shafts of the long bones hollow?....980b
How long do the "milk" teeth last?....983a
What is the alimentary tract?....982b
Of what advantage is the "ball-and-socket" joint in the hip?....980b
What are adenoids?....984bc
What are the two circulatory systems?..986b
What has the mouth to do with digestion?....982b
What action should be taken if a joint becomes dislocated?....980b
What is a neuron?....978b
What part of the body weight is muscle?..981b
Distinguish between tissues and organs..977c
What are the two types of cells suspended in the blood?....987a
Why does exercise benefit muscles?....981c
What are the tonsils? What is tonsillectomy?....984b
Name three excretory glands and explain their functions....988bc
What does the liver secrete, and what is the function of this secretion?....982bc
What are the chief parts of the nervous system?....989c
What changes result from respiration?..985b
What is glycogen?....982c
What are the bad results of poor posture?....981a
Of what four layers is the skin composed?....978c
Why is acidophilus milk used?....983a
Describe the general scheme of the skeletal system....978c
Of what advantage is the S shape of the spinal column?....978c

Questions Children Often Ask

Where does chocolate come from?.... 400d
Where do bananas grow?.... 399d
How fast does the earth turn on its axis? 887a
How do you play The Windmill game?. 40b
How does the butterfly weed get its name?.... 903a
Where does sugar come from?.... 399a
Do snakes have feet?.... 974c
When will the pansies bloom?.... 397c
Are cowpeas good to eat?.... 904b
How are shoes made?.... 411
Where does bamboo grow?.... 406c
Who made the first balloon?....1181c
Why do people have freckles?....1186c
What is the difference between a turtle and a tortoise?.... 975c
Why do we laugh?....1187a
Where does cork come from?.... 904a
What makes the bees hum?....1188c
What is the Blarney Stone?....1189a
What makes the sky blue?....1189b
What causes the rainbow?....1225b
Why do the Chinese pay high prices for ginseng roots?.... 905c
Who is Uncle Sam?....1235c
Where does the wind come from?....1238b
Where should I keep my toys?.... 16c
What do the three golden balls over the pawnbrokers shop mean?....1222b
Who brought together the first *Mother Goose Melodies?*.... 132a
Why is the Indian pipe sometimes called "ghost flower"?.... 906c
How do parrots climb?.... 973b
Where did the name Thursday come from?.... 175a
What is castor oil made from?.... 409a
Who was Saint Patrick?.... 599c
What is rubber made from?.... 409a
What is smoke made of?....1227c
Where do loganberries grow?.... 907c
Who was the first Santa Claus?....1226b
What is the shamrock?.... 911a
What does SOS mean?....1226a
How did the prairie dog get its name?... 973c
What is the national song of France?..1213c
What is the man in the moon?....1210a
Do toads cause warts?.... 975c
What makes the lightning?....1209ab
How thick must ice be to hold up a person?....1207c
How did the custom of shaking hands begin?....1205a
What are "kid-glove oranges"?.... 908c
What does the word "Christmas" mean? 1205c
Is an eel a fish?.... 969c
Why does the geyser throw hot water into the air?....1203b
How is "prisoner's base" played?....1035ab
Where was the Garden of Eden?....1203a
How does a baboon defend itself?.... 966c
How should we hang the flag?....1201c
How does the pitcher plant catch insects?.... 909c
How far does an echo go?....1200a
How high is the Washington Monument?....1191b
How long is Brooklyn Bridge? London Bridge?....1190bc
What are the northern lights?....1188a
Why do we yawn?....1187b
What does the hippopotamus eat?.... 971a

Sculpture

In what age did sculpture reach the greatest height?....1098ab
What materials are used in sculpture?..1105a
What new elements did Rome add to sculpture?....1108a
What name has often been applied to Donatello's statue of Saint George?..1110b
What is polychromy?....1105a
What country was the birthplace of the Gothic style in sculpture?....1109a
What were the four periods of Greek sculpture?....1106b
Characterize the sculptured group, *The Fates*....1107bc
Name five great Italian sculptors....1112b
Characterize the work of Rodin....1111c
Describe briefly some of the sculptures of the Parthenon....1106c
For what was Frémiet noted?....1108a
Discuss the work of Michelangelo as a sculptor....1110c
What was the contribution of Praxiteles to sculpture?....1107a
What great modern sculptor has Belgium produced?....1111c
What great works of sculpture are to be seen at Strassburg Cathedral?....1109c
Name ten American sculptors....1112c
Name four reference books on sculpture....1180bc
Since the Renaissance what has been the relation of sculpture to architecture?....1098b
What is the triple mission of sculpture of the human figure?....1105bc
What and where is Statuary Hall?....1227c

Zoölogy

What are the usual tests of living objects? 957a
What are the two main types of reproduction among animals? 961b
What is histology? 962b
What is the cell theory and who first stated it fully? 966a
What is the theory of organic evolution? 965c
What is protoplasm? 957a
What is animal behavior, and what four grades are recognized? 965a
Name four common crustaceans 969a
When did the boll weevil enter the United States? 967c
What is ecology? 965b
What does the name "amphibian" mean? 966a
Are zebras easily domesticated? 976b
What are monotremes, and where are they found? 972c
When did the dodo become extinct? 969b
What are the flatworms, and where are they found? 958b
Which has more species, the mammals or the insects? 960ab
Explain and illustrate osmosis 964a
How large are armadillos? 966c
Where does the condor live? 968c
How does the humming bird rank in intelligence? 971a
Do flying squirrels fly? 975a
Are all lizards poisonous? 972a
What do ravens and parrots have in common? 974a
Why can boas swallow bodies thicker than themselves? 967c
What are the five classes of the arthropods? 959ab
What is the blastula? 961c
Of what value to man is the dragon fly? 969b
What famous trait does the lemming have? 971c
Where are the best talking parrots obtained? 973b
Which thrush is the best singer? 975b
Can the porcupine shoot his quills? 973c
Where does the cowbird lay her eggs? 969a
How large is the great anteater? 966b
What is the oldest bird known? 960c
What is parthenogenesis? 962b
What is meant in ecology by the "web of life"? 965b
What name is given to the most highly developed monkeys? 966c
What two animals of South America are closely related to the camel? 968a
How does the hookworm injure human beings? 971a
Can an ostrich fly? 973b
Is the turkey well named? 975c
How does the lung fish change its breathing habits? 972a
Do wasps live alone or in colonies? 976a
What is the meaning of "smolt" and "grilse"? 974b
What is economically the most important crustacean? 972a
Into what three parts is the body of an insect divided? 971b
Where are cuttlefish used for food? 969b
What organisms are claimed both by botanists and zoölogists? 957c
What use is made of clam shells? 968c
What is genetics? 965c
For what other scientific studies is a knowledge of zoölogy essential? 957a
Is the bite of the adder fatal? 966a
Describe the working bee; the queen; the drone 967b
How did John Burroughs characterize the robin? 974a
What is the only species of elephant ever domesticated? 969c
How does the buzzard help the farmer? 968a
Does the guinea pig have a suitable name? 970c
What are Marco Polo's sheep? 974b
How big are the horns of the bighorn? 967b
What are the biggest snakes and where do they live? 974c
Describe a community of ants 966b
What reptiles have the ability to change their color? 968b
Name a hawk that is beneficial 971a

ANALYTICAL INDEX

EXPLANATIONS: Reference numbers and letters give page and column, as 25a indicates page 25, first column, 25b indicates page 25, second column, etc. References to the Dictionary of Biography are indicated by the abbreviation, biog. Other abbreviations used are: illustration (illus.); colored illustration (col. illus.); table (tab.); diagram (diag.); portrait (port.); opposite (opp.).
